But far beyond theſe in merit and importance, is a large folio print of "The Landing of the Britiſh Troops under Gen. Abercrombie in Egypt," after de Loutherbourg, in which the fire, freedom, and vigorous chiaroſcuro of that maſter are moſt happily rendered, and for the production of which, the ſociety in the Adelphi for the Encouragement of Arts, &c. did themſelves the honour of preſenting the engraver with a medal. By a judicious admixture of ſtippled hatchings, in imitation of chalk drawing when performed by the hand of a maſter, Schiavonetti has here revived, with ſuperior brilliancy and effect, the real chalk manner of engraving, which we call thus in contradiſtinction to Ryland's art of imitating ſtumpted drawings, or what the French aptly term "en manière de crayon noir," and has even enlarged the former boundaries of this mode of art. On the whole, this is probably the moſt perfect chalk-engraving that has yet been executed, and of itſelf, would be a monument of reputation in this branch of the art.

The chief of his *etchings* are, a ſet of twelve, in ſmall folio, from drawings by W. Blake, of which the ſubjects are taken from Blair's poem of the Grave. Theſe are works of great merit, and (as we venture to pronounce) of laſting reputation; and though it be too true, that, in the words of this poet,

> "The beſt concerted ſchemes men lay for fame
> Die faſt away; only themſelves die faſter:"

they yet prove, in oppoſition to his leading ſentiment, that it is *not*

> "Abſurd to think to over-reach the grave,
> And from the wreck of names to reſcue our's."

Faithfully adhering to the character of art that is implied by the term *etching*, Schiavonetti is here ſlight and ſketchy, and has produced his effects chiefly by the operation of aquafortis, with his uſual fine feeling, and a congenial unſtudied ſimplicity of ſtyle. The eye of diſcernment immediately ſees that the ſame high finiſhing which he beſtowed on his plates after Vandyke, was never intended, and that what was intended is preciſely accompliſhed.

Of this ſeries of meritorious etchings, which were printed with Blair's poem and an able preface by the profeſſor Fuſeli, and publiſhed by Mr. Cromek, the ſubjects are 1. The Deſcent of Chriſt into the Grave; 2. The Deſcent of Man into the Vale of Death; 3. Death's Door; 4. The ſtrong and wicked Man dying; 5. The good old Man dying; 6. The Soul hovering over the Body; 7. The Soul exploring the Receſſes of the Grave; 8. The Counſellor, King, Warrior, Mother, and Child in the Tomb; 9. The Skeleton re-animated; 10. The Re-union of Soul and Body; 11. A family Meeting in Heaven; and 12. The Laſt Judgment. Theſe are preceded by a portrait of Mr. W. Blake, the poetic deſigner of the work, after T. Phillips, R. A. in which our engraver has manifeſted great judgment and taſte. It is alſo an etching, treated in the vignette ſtyle, with ſmall aſſiſtance from the graver and dry-point, where a certain degree of mellowneſs or blending were wanted, and the whole brought to a focus in the animated and thinking countenance which is the proper ſubject of the print. Two etchings after Caracci, in folio, were afterwards finiſhed in aquatinta, for Mr. Chamberlayne's work from the Royal collection; two unpubliſhed large folio plates of "The Departure, and the Return, of the Savoyard Muſicians," ſlight, but performed with ſingular felicity.

Finiſhed Engravings.—"The Madre Doloroſa," or dead Chriſt on the lap of his Mother, after Vandyke, which he engraved in ſmall folio, for the French publication, after their national gallery at Paris, is of a diſtinct claſs and character from the above; more elaborate, more difficult of accompliſhment, and combining merits of a loftier and more exquiſite kind.

Here the mellow and harmonious mixture of etching, with the work of the graver and dry needle; the various combinations, by means of theſe inſtruments, of clear, broken, contraſted, and partially obſcured, lines and ſtippling, by which he has expreſſed in their reſpective degrees of ſubordination to the purpoſe of the painter, rock, ſky, hair, white and coloured draperies, and, above all, the anatomical markings, carnation tints, and fleſhy texture, of the exquiſitely finiſhed naked figure of Jeſus Chriſt, are truly admirable: and if not unparalleled, have certainly not been ſurpaſſed. Nor are the extremities of every figure in the compoſition rendered with leſs of taſte, knowledge, or ſkill. Bolſwert had engraved a larger print of this ſubject from Vandyke's original picture, a print of great merit; and to a nice obſerver, it is intereſting to compare the details of the two engravings, and ſee how ſedulouſly, and with what delicacy of diſcernment, the Italian artiſt has avoided every error, and improved every beauty, of the Fleming.

It is exceedingly to be regretted that among the works of Schiavonetti, we find ſo few of this inimitable claſs, for no man more than he, has united the excellencies which muſt enter into the conſtitution of a highly finiſhed engraving. Another of theſe highly finiſhed engravings, which is alſo after Vandyke, and of large 4to. ſize, is a portrait of the painter himſelf, habited as a peaſant, and the ſame general obſervations will apply to both, for both are admirable epitomes of the powers of Vandyke; of the latter it has been truly ſaid, that "its excellencies will be found to conſiſt in its being at the ſame time a complete epitome of the original picture and of the powers which an engraver of genius can diſplay upon ſo confined a ſubject as a half-length figure, without landſcape, ſky, or any other accompaniment of back ground. It is throughout quite as well drawn as Vandyke's original; the texture of fleſh is as perfectly expreſſed, with all its varieties and inflexions of ſurface and chiaroſcuro; nor is the drapery leſs well felt and underſtood, nor ſcarcely leſs ſkilfully engraven, than the naked parts of the figure; all are ſufficiently finiſhed, but without petty trickery, or vain labour, and the eye ſparkles with all the fire of Vandyke's."

Theſe remarks are taken from "The Review of Art," (vol. i. p. 40.) which proceeds to ſtate what is equally applicable to both theſe engravings after Vandyke, namely, that "in addition to all their other perfections, they powerfully ſuggeſt the idea of colour, mingling its magic blandiſhments with thoſe of light and ſhade; and preſent the moſt perfect example we have yet ſeen on paper of the ſtyle of Vandyke's pencilling, and Vandyke is in this reſpect the very perfection of ſtyle, or at leaſt approximates the neareſt to it of any painter whatever, except perhaps Fyt, who exerciſed his powers on ſubjects of quite a different kind."

Another 4to. plate, which our artiſt engraved after a very excellent picture by R. Smirke, R. A. as an accompaniment to Joel Barlow's Columbiad, and of which the ſubject is "The Triumph of the Holy Inquiſition;" ſome plates which he engraved for Sharpe's Britiſh Claſſics, and two for an edition of Homer, after the academicians Fuſeli and Howard, poſſeſs merits of a ſimilar kind, though, on account of the ſmallneſs of the ſcale, they could not be ſo effectually diſplayed.

The remainder of his finiſhed engravings in lines, are the hovel ſcene in King Lear, after Smirke; and two or three other plates for the ſmaller edition of Boydell's Shakſpeare, which are among the very beſt in that motley and undigeſted work; and ſome ſmall portraits, particularly one of Mr. W. Cunningham (an Iriſh gentleman, diſtinguiſhed for his taſte and patronage of the fine arts); another, of a writing maſter, well known and diſtinguiſhed in his profeſſion, and a buſt of Homer, from the celebrated marble in the Townleian Collection, all of 8vo. dimenſions.

His folio print, engraved in the fourth remove from Michael Angelo's celebrated Cartoon of Piſa, is of a middle character, leſs elaborate than his prints from the pictures of Vandyke, though ſomewhat more ſo, than his etchings after the poetical ſketches of Mr. Blake: in ſhort, a graphic tranſlation of a Cartoon, or preparatory ſtudy for a high-finiſhed picture.

His academical knowledge and ſkill were here, perhaps more than in any other of his productions, called into action, and their ſtrength put to the teſt. Nothing ſtood higher in theſe reſpects than the reputation of the great original, which is even, by Benvenuto Cellini and other excellent judges, eſteemed the maſterpiece of Michael Angelo: and this high reputation Schiavonetti had not merely to ſuſtain, but in ſome degree to reſtore; for the Cartoon itſelf being deſtroyed (in a fit of envy, as it is ſaid, by Bandinelli, who was entruſted with the key of the apartment where it was placed,) and the details of its ſuperlative merits being known to us moderns, only through the media of Sangallo's copies, and the ſeparate groups which have been engraven by Marc Antonio, Agoſtino of Venice, and other contemporary artiſts, whoſe works we have already enumerated under an early part of this article of the Italian ſchool, our engraver felt it to be his duty to collate theſe verſions and fragments of the Cartoon of Piſa with conſcientious ſcrupuloſity, and, by balancing probabilities, to reſtore what may be called the true claſſical reading. An awful taſk! yet which he has performed with the ability and ſucceſs of a conſummate ſcholar in art.

The reader ſhould be appriſed, that the Holkham copy, which is believed to be the work of Baſtiano de Sangallo (an artiſt who was never held in any very high degree of eſtimation) was painted in his old age, from a ſmall drawing which he had himſelf copied from the original Cartoon in the year 1542, during his pupilage. It was made at the requeſt of Vaſari, and, through means of Monſignor Jovio, came into the poſſeſſion of Francis I. of France, who highly eſteemed it; from his collection it however diſappeared, and no mention is made of it by the French writers for near two centuries. It was probably diſcovered at Paris, purchaſed, and brought to England by the father of the late marquis Townſhend.

Schiavonetti had not even this copy to work from, but a copy of this copy, and has therefore, with commendable regard for his own reputation, and that of Michael Angelo, and with due reſpect for the public, who always ought to be rightly informed upon ſuch occaſions, followed the recommendation which was publicly laid before him in the Review of Art, vol. i. and ſcratched with his dry needle under the few proofs which were received as preſents by his friends, "Engraved by L. Schiavonetti, after a copy painted by H. Howard, R. A. from da Sangallo's copy of his own ſtudy, after Michael Angelo's cartoon."

The ſame reſpect for truth and the public, which dictated this recommendation and this conduct, requires us to mention that Schiavonetti has corrected a general heavineſs of drawing which prevails in Mr. Howard's picture, which heavineſs that accompliſhed artiſt no doubt found in the Holkham copy, but which is perfectly inconſiſtent both with the active ſentiment of the ſubject, and the earlier graces of Michael Angelo's compoſition. A foot of one of the principal figures, which is there turned inward, he has turned outward; and, beſide ſome other minor details, has added requiſite ſtrength to the hams of the figure who is climbing the rocky bank of the Arno. Whether our artiſt had ſeen the ſmall fragment of Michael Angelo's original, which is ſaid to be ſtill in exiſtence at Mantua, or of what part or parts that fragment may conſiſt, the preſent writer is not able to ſay; but Schiavonetti was in poſſeſſion of various old prints of its principal groups, of which we have already ſpoken in our accounts of Marc Antonio and his diſciples, and which were executed for the moſt part during the lifetime of Michael Angelo, and from comparing them, and reflecting on the whole, has ventured on the above emendations of the extant copies.

As this cartoon of Piſa is eſteemed to have been one of the moſt extraordinary works that has been produced ſince the revival of art, the reader will not be diſpleaſed to find here the following eloquent account of it, as delivered from the profeſſor's chair of the Royal Academy of London, by M. Fuſeli. It does not in all its details exactly tally with the print, but its general ſentiment of impatient animation and patriotic ardour is preciſely the ſame. "It repreſents an imaginary moment relative to the war carried on by the Florentines againſt Piſa; and exhibits a numerous group of warriors, rouſed from their bathing in the Arno, by the ſudden ſignal of a war-horn, and ruſhing to arms. In imagining this tranſient moment from a ſtate of relaxation to a ſtate of energy, the ideas of motion, to uſe the bold figure of Dante, ſeem to have ſhowered into the artiſt's mind. From the chief, nearly placed in the centre, who precedes, and whoſe war-voice accompanies the trumpet, every age of human agility, every attitude, every feature of alarm, haſte, hurry, exertion, eagerueſs, burſt into ſo many rays, like the ſparks flying from a red-hot iron. Many have reached, ſome boldly ſtep, ſome have leaped, on the rocky ſhore; here two arms emerging from the water grapple with the rock; there two hands cry for help, and their companions bend over or ruſh on to aſſiſt them; often imitated, but inimitable, is the ardent feature of the grim veteran, whoſe every ſinew labours to force over the dripping limbs his clothes, whilſt gnaſhing, he puſhes his foot through the rending garment. He is contraſted by the ſlender elegance of a half averted youth, who ſedulouſly eager buckles the armour to his thigh and methodizes haſte; another ſwings the high-raiſed hauberk on his ſhoulder, whilſt one who ſeems a leader, mindleſs of dreſs, ready for combat, and with brandiſhed ſpear, overturns a third, who is crouched to graſp a weapon; one naked, himſelf buckles on the mail of his companion, and he, turned toward the enemy, ſeems to ſtamp impatiently the ground. Experience and rage, old vigour, young velocity, expanded or contracted, vie in exertions of energy; yet in this ſcene of tumult one motive animates the whole, eagerneſs to engage with ſubordination to command; this preſerves the dignity of action, and from a ſtraggling rabble, changes the figures to men whoſe legitimate conteſt intereſts our wiſhes."

Three plates in lines, which he advanced no further than the aquafortis ſtate, will cloſe our liſt of the works of this admired and regretted artiſt. The firſt, in the order of production, is a maſterly etching of large folio ſize, after Trumbull, of "The Death of General Montgomery," which was finiſhed by Mr. Clemens (a German artiſt). It was performed ſeveral years ago, and diſcloſed powers which ought to have made an earlier impreſſion than they did on the eye and taſte of the public. The next is "The Proceſſion of Chaucer's Pilgrims to Canterbury," a large folio plate of the frieze proportions, after a very capital work from the pencil of the academician Stothard.

Chaſtening every ambitious diſplay of his own executive powers; repreſſing every idea and every feeling that was not homogeneous with the nature, and proportioned to the demands of the occaſion, Schiavonetti has here, like the hero of the Odyſſey, expreſſed, "no more than juſt the things he ought." The ſpirit which animated him in the performance of this work, like that which has animated the painter, ſeems to have glided from the elyſium of the great artiſts of antiquity; there is the ſame truth of Nature, and the ſame unoſtentatious claſſic purity of ſtyle, pervading the whole;

"Enlight'ning ev'ry line in ſuch a guiſe,
That they ſeem rather fallen from the ſkies
Than of a Mortal hand."

Since the lamented death of Schiavonetti, the proprietor of this plate has with ſome inconſiſtency ſtated to the public, that, "in the preſent ſtate of this etching, conſidered with reference to the peculiar circumſtances of the caſe, perhaps no better mode could be deviſed of paying an impreſſive and laſting tribute to his memory, and one in which all his admirers could participate, than by giving it to the public as he left it, a conſecrated monument of his genius;" he has before held forth a powerful additional motive to this end, a motive as powerful as taſte and friendſhip themſelves could have connected with ſuch a purpoſe, by informing his readers, that "the movement of the figures and the expreſſion in their heads and characters are as finely maintained in outline, as they could poſſibly have been in the moſt finiſhed print," which is pretty ſtrong language, yet he has ſince announced Mr. Bromley and himſelf as the finiſhers of the plate.

Now, though the preſent writer does not think finiſhing, in the engraver's art, is thus utterly thrown away, or contributes nothing in addition to an exquiſite outline, to the motions, characters, and expreſſions of a protracted group of figures, ſuch as the Canterbury pilgrims; or though, regarding the above as an impaſſioned, or hyperbolic ſentence from the pen of Mr. Cromek; he can make due allowance for the occaſion which gave it birth, he yet thinks the impreſſive and laſting tribute to the memory of Schiavonetti ſhould have been paid; the monument which his genius itſelf had raiſed ſhould have been conſecrated; and he therefore regrets thoſe views of profit, or thoſe hopes of reputation, or thoſe ulterior miſtakes which have prevented this conſummation. Achilles and Ulyſſes could not both be the heroes of the ſame poem; and it would have been wiſe for Mr. Bromley, and well for the public, for him to have begun *his* Canterbury pilgrims on a freſh plate of copper.

The next, and the laſt of our artiſt's performances, was an etching, of folio dimenſions, of the portrait of ſir Joſeph Banks, as preſident of the Royal Society, from a picture by T. Phillips, R.A. replete with that truth of character and mild force of execution, which uſually diſtinguiſh the works of this painter. To detail the merits of this work, would be but to call forth afreſh our former praiſes; it is as maſterly a diſplay of his talent in the portrait branch of his art, as the etching of the Canterbury pilgrims is of his merit in the hiſtorical. This plate, as we are given to underſtand, is now finiſhing by Nicholas Schiavonetti, who may naturally be preſumed to be at leaſt as well acquainted with his brother's ſtyle and profeſſional intentions, as any engraver whatever.

Of Franciſco Bartolozzi of Florence, the pupil of Wagner, but more the pupil of Italy and nature, and the principal inſtructor of Schiavonetti and Volpato, we ſhall ſay but little. He is ſtill at upwards of fourſcore years of age, conſidered as ſpeaking for himſelf by his productions, though doomed to linger out the evening of his glorious day, in Portugal, far from the haunts of ſtudious retirement, and amidſt the din of arms. Till nature has cloſed her account with him, what bold auditor ſhall preſume to eſtimate his worth?

Of him and his diſciple Schiavonetti, we have already ſpoken as two of the brighteſt ſtars in our graphic hemiſphere. The latter has fallen from his zenith: that Bartolozzi may long remain above the horizon, is our fervent wiſh.

But it has been emphatically ſaid, that "ſtars teach as well as ſhine." On the continent of Europe, they teach and ſhine in vain, while war deſolates the plains of the weſtern peninſula; if Ate flings wide and wild her torch, in vain exiſt the charms and the leſſons of art: in vain are the heavens ſerene, if an earthquake rages below.

ITALIC, or Italian *Hours*, are the twenty-four hours of the natural day accounted from the ſun ſetting of one day to the ſame again the next day.

This way of reckoning was uſed by the Jews of old, and is uſed by the Italians to this day.

Italic *Character*, in *Printing*. See Letter.

Italic *Sect*, is the name of a party of ancient philoſophers founded by Pythagoras; ſo called, becauſe that philoſopher taught in Italy, ſpreading his doctrine among the people of Tarentum, Metapontus, Heraclea, Naples, &c. See Pythagoric *Sect*.

ITALY, in *Geography* and *Hiſtory*. In ancient geography, this country, the moſt celebrated in Europe, was denominated Italia. It is bounded on the N. and N.W. by the Alps; on the E. by the mare Superum, that is, the Adriatic gulf, or gulf of Venice; on the W. by the mare Inferum, or Tuſcan ſea; and on the S. by the Ionian ſea adjacent to Greece. In form, it has been compared to the ſhape of a boot, lying in an oblique direction from N.W. to S.E. From the Alps to the fretum Siculum, or ſtrait of Meſſina, it extends from 47° to 37° 45′ N. lat. or about nine degrees. In breadth it is very unequal, in ſome places not exceeding 2°, and in others upwards of 8° long.; hence its length from N. to S. is about 600 miles, and its breadth varies from 1 to 300 miles or more. It has borne at different periods very different names. One of its moſt ancient names was Italia, either from Italus, a king of that country, not known in hiſtory, or from a Greek word ſignifying an ox, an animal very common in that part of the country. It was denominated "Heſperia," on account of its weſtern ſituation in reſpect to Greece; "Saturnia," from Saturn; "Latium," from the Latini; "Auſonia," from the Auſones; "Oenotria," from a tribe ſettled between Pæſtum and Tarentum. Theſe names were originally appropriated to particular provinces, but in proceſs of time they were applied to the whole country, which has been denominated the garden of Europe. The ancient inhabitants called themſelves aborigines, offspring of the ſoil; and the country was, at a very early period, peopled by colonies from Greece. The Pelaſgi and Arcadians made ſettlements there, and the whole country was divided into as many different governments as there were towns, till the rapid increaſe of the Roman power changed the face of Italy, and united all the ſtates in ſupport of one common cauſe. (See Rome.) Under the dominion of the Gauls and Greeks, Italy, in reference to its inhabitants, was divided into "Gallia Ciſalpina," "Italia Propria," and "Græcia Magna:" the firſt comprehended the provinces lying between the Alps, and the Rubicon; the ſecond included the intermediate provinces; and the third thoſe adjacent to Sicily and Greece, and inhabited chiefly by Grecian colonies. It was divided into eleven ſmall provinces or regions by Auguſtus; but according to the common and moſt approved diviſion, ancient Italy conſiſted of two parts, *viz.* "Gallia Ciſalpina," and "Italia Propria:" the former, likewiſe called "Gallia Italica," and ſometimes "Gallia," was bounded on the N. by Rhætia, and on the S. by the ſinus Liguſticus, or gulf of Genoa. This province, while under the Roman dominion, contained ſeveral tribes, which will be noticed in their places. Italia Propria was on all ſides ſurrounded by the ſea, except on the N. where it was bounded by an imaginary line, extending from the mouth of the Macra to that of the Rubicon. It contained, among others, the following provinces, *viz.* Etruria, Sabinum, Latium, Campania, Samnium, Apulia, Meſſapia, Lucania, and Brutium. During the middle ages Italy underwent many revolutions, and frequently changed its maſters. In the reign of Honorius the Viſigoths, under the command of Alaric, penetrated into that fertile country, which they plundered from the foot of the Alps to the ſtrait of Sicily. The reign of the Goths in Italy ended in Teia, Totila's ſon, who was defeated and ſlain by Narſes in the year 553. Italy now became a province of the Greek empire. The Lombards were a fierce nation, firſt diſcovered between the Elbe and the Oder, from thence they deſcended to the ſouth and the Danube. They afterwards paſſed the Danube, wandered along the coaſt of the Adriatic, and in the year 566, aided by the Avari, a Scythian horde, they undertook the conqueſt of Italy. Many provinces were added to their dominions, as a large portion of the Venetian territory, Tyrol, Milaneſe, Piedmont, the coaſt of Genoa, Mantua, Parma, and Modena, the grand duchy of Tuſcany, together with a conſiderable portion of the eccleſiaſtical ſtate.

Italy, in the modern acceptation of the word, includes both main land and iſlands. The former, by geographers, is commonly divided into upper, middle, and lower. Upper Italy, called Lombardy, contains ſeven duchies, ten ſmall principalities, and two republics. Middle Italy conſiſts of the grand duchy of Tuſcany, the eccleſiaſtical ſtate, and two republics. Lower Italy includes a part of ancient Italia Propria, and the kingdom of Naples. The climate of this country differs with its different diviſions. In mountainous diſtricts the air is keen and piercing; the provinces, north and eaſt of the Apennines, are mild and temperate; thoſe on the S. of that chain are warm, ſultry, and liable to torrents of rain. An account of the mountains, rivers, and lakes, belonging to Italy, or dividing it from other countries, will be found in the alphabetical order of this work. (See Alps, Apennines, Po, &c.) There is a very conſiderable diverſity in the ſoil as well as the climate. The northern diviſion exhibits the grand ſcenery of the Alps, contraſted with delightful vallies and plains, watered by many ſtreams which run towards the ſouth to augment the Po. In the central parts are marſhes, ſtagnant waters, and fruitful diſtricts. A great proportion of the kingdom of Naples (which ſee) is hilly, but many tracts, though ſubject to inconveniencies, are uncommonly fertile. Italy has been denominated the parent of plenty, and each province has its peculiar excellence and commodity; and, taken together, they all yield the comforts and luxuries of life in great abundance. In the time of Pliny, Italy was ſaid to contain 14,000,000 of inhabitants. This was probably an exaggerated account. The preſent population, though not eaſy to be got at, cannot, with the iſlands of Sicily and Sardinia, be eſtimated at more than 13,000,000. Naples and Sicily are ſuppoſed to contain 6,000,000; the central part about 3,000,000; and the northern about 4,000,000. The manners and cuſtoms of the natives are various and diſcordant. The real Italians are in general well proportioned, affable, polite, profuſe in their compliments, and nice in all punctilios of civility, obſerving, it is ſaid, a due medium between the levity of the French and the gravity of the Spaniards. They are impetuous in their temper, keen in their reſentments, revengeful in their manners, and ſuperſtitious in their religion. "Attached," ſays Mr. Playfair, "to ancient cuſtoms, they apprehend no occaſion for improvement. Conceiting themſelves to be the conquerors of the world, they look on the reſt of mankind with contempt. Out of a vain oſtentation, they laviſh their money on paintings, gardens, and ſtatues, on coſtly equipages, and a numerous retinue of ſervants; but this profuſion does not ſeem to interfere with the economy of their tables, which are neither ſplendid nor expenſive. Their dinner, conſiſting principally of roots and vegetables, is a ſlight meal compared with their ſupper; but at all times they eat and drink ſparingly. Their houſes, furniture, and entertainments, are a compoſition of magnificence and meanneſs. While they delight in outward ſhow, they beſtow little attention on the comforts of life. Maſquerading, gaming, converſations, muſic, and religious exhibitions, are their chief amuſements." The dreſs of the Italians is not materially different from that of the inhabitants of the neighbouring countries; and it has been obſerved, with much juſtice, that Italy, inſtead of being viſited by travellers for the ſake of its inhabitants, is viſited only for the ſake of the places which they inhabit. There are ſome remains of foreſts among the Apennines; but the early civilization of Italy has been diſadvantageous to the growth of timber. The botanical products of Italy are ſuppoſed to be equal to thoſe of any European country, on account of the great variety of its ſoil, the irregularity of its ſurface, and the genial benignity of its climate. In the ſouthern parts, cotton, rice, and the ſugar-cane, indicate the fertility of the ſoil, and the warmth of the climate; and the fields and the paſtures bear a ſtriking reſemblance, in their native products, to thoſe found in the ſouthern provinces of Spain. The Italian horſes are of little reputation, and the cows, from which the noted Parmeſan cheeſe is made, are deſcribed as of a deep red colour, long, lank, and ill made. In Tuſcany the art of fattening cattle is well underſtood. The buffalo is, in Europe, almoſt peculiar to Italy. This animal in ſome reſpects reſembles the hog, being fond of wallowing in the mud; his fleſh is coarſe, and his hide, though light, is ſo firm as to have ſupplied armour to the military. The marmot and the ibex are reckoned among the animals of the Apennines, and the creſted porcupine is eſteemed peculiar to the ſouth of Italy. The Alpine diſtrict abounds in rich mines which are neglected: here are mines of ſilver, lead, iron, copper, and gold: in many parts there is excellent coal, and in detached hills throughout the country, marble, lime-ſtone, metallic ores and minerals are found. There are but few manufactures in Italy in proportion to the fertility of the ſoil. Thoſe of ſilk and wool are carried on to a conſiderable extent: but great quantities of the raw materials are exported. Beſides theſe, wine, oil, and fruits are exported in abundance. The chief imports are hard ware, metals, cotton, woollen and ſilk ſtuffs, leather, timber, pitch, &c. The ſkill of the natives in ſtatuary, painting, and architecture, has been long the ſubject of admiration. The eſtabliſhed religion is the Roman Catholic, conſiſting chiefly in external obſervances, rites, and ceremonies. The pope is ſtill looked up to as the head of the church; but his power and influence are now almoſt wholly deſtroyed. Before the late revolution, the form of government in the ſtates of Italy was monarchical, and in the republics it was ariſtocratical. The ſovereigns governed their dominions with unlimited authority: in the republics of Venice, Genoa, and Lucca, the nobility ſhared in the management of the ſtate. In the preſent unſettled ſituation of the country it is not poſſible to give any tolerable eſtimate of the revenues: they were reckoned between four and five millions ſterling towards the cloſe of the laſt century. Anciently, Italy gave birth to men illuſtrious in almoſt all the departments of ſcience then cultivated: the generals, philoſophers, hiſtorians, orators, and poets of Rome can never be forgotten. In the ſixth century, when numerous tribes of barbarians overran the Roman empire, ſcarcely a veſtige of literature and the fine arts remained. From this period until the 16th century, the human mind ſunk into profound ignorance, but ſince the revival of learning very many eminent perſons have appeared in Italy that have adorned the ſciences and the various branches of literature. The elegant arts of ſculpture, painting, architecture, and muſic have likewiſe been cultivated with ſucceſs.

We have already alluded to the early hiſtory of Italy, which, in a few lines, we brought down to the invaſion, and, indeed, conqueſt of that country by the Lombards. The great object of ambition to this new race was the entire conqueſt of all Italy, and this, as in almoſt all other ſimilar caſes, proved the ruin of their empire by Charles the Great, or, as he is generally denominated, the illuſtrious Charlemagne, who was crowned ſovereign of that country in the year 800. As, however, the Lombards had never poſſeſſed the whole of Italy, ſo the whole of it never came into the poſſeſſion of Charlemagne, nor, indeed, ſince the time of the Goths, has the whole extent of this country been under the dominion of any ſingle ſtate. The undiſputed territory of Charlemagne in Italy was reſtricted to Piedmont, the Milaneſe, and the Mantuan territories, thoſe of Genoa, Parma, Modena, Tuſcany, Bologna, the dukedoms of Friuli, Spoleto, and Benevento, the laſt of which contained the greater part of the preſent kingdom of Naples. The feudal government which the Lombards had introduced into Italy produced ſeveral revolts, as the different dukes inclined, either to change maſters, or to ſet up for themſelves. Several of theſe rebellions happened during the life of Charlemagne, which, by the vigour of his mind and the deciſiveneſs of his meaſures, he found means to cruſh; but after his death, the ſovereignty of Italy became an object of contention between the kings of France and the emperors of Germany. That monarch had divided his extenſive dominions among his children; but they all died during his own reign, excepting Lewis, whom he aſſociated with himſelf in the empire, and who ſucceeded to all his dominions after his death. Hence are dated thoſe troubles with which Italy was ſo long overwhelmed, and of which, as they proceeded from the ambition of thoſe called kings of Italy and their nobles, of the kings of France, and the emperors of Germany, it would be difficult to give our reader any ſatisfactory account, although we were to extend the boundaries of the preſent article much beyond the limits that can be allowed it. We ſhall attempt only an outline. At the time when Lewis, the ſon of Charlemagne, was declared emperor of the Weſt, Italy was held by Bernard, the ſon of Pepin, brother of Louis. Though Bernard bore the title of king, he was only accounted a vaſſal of the emperor. He ſoon rebelled againſt his uncle, but being abandoned by his troops, and taken priſoner, he was deprived of his ſight, and died in a few days; and in 823 the eldeſt ſon of the emperor was ſent into Italy, of which country he was crowned king at Rome, and afterwards emperor of the Weſt during his father's life-time. He alſo rebelled againſt his father, whom he took more than once priſoner, though in the end he was obliged to ſubmit, and aſk pardon for his offences. In the mean time the Saracens, taking advantage of the civil commotions, landed on the coaſts of Italy, and committed ſuch ravages, that even the biſhops were obliged to arm themſelves in defence of the country. Lothaire took but little care to put an end to theſe ravages, or to reſtore tranquillity, he even embroiled himſelf ſo far till he had loſt almoſt all his dominions: at length he died, leaving his ſon Lewis the title of emperor, as well as that of king of Italy. Lewis applied himſelf to the reſtoratioa of tranquillity in his dominions, and the driving out of the Saracens from thoſe places of which they had poſſeſſed themſelves in Italy. This arduous taſk he fully accompliſhed, and obliged the infidels to retire into Africa, but in 875 he died, without naming a ſucceſſor. After this event, the Italian nobles, headed by the duke of Tuſcany, repreſented to the pope, that as Lewis had left no ſucceſſor, the regal dignity, which had been ſo long uſurped by foreigners, ought now to return to the Italians. The pope, however, crowned Charles the Bald of France emperor and king of Italy, on the condition of his acknowledging the independency of Rome, and that he himſelf only held the empire by the good-will and gift of the pope. This produced a ſerious conſpiracy among the diſcontented nobles, of which the Saracens took advantage, renewed their incurſions, and even threatened the eccleſiaſtical territories with the utmoſt danger. The pope earneſtly ſolicited the emperor's aſſiſtance, but that prince died before he could afford him any effectual aid, and being diſtreſſed by the Saracens on the one hand, and the Lombard nobles on the other, the wretched pontiff was forced to fly into France. Italy now fell into the utmoſt confuſion and anarchy; during which, many of the nobles and ſtates of Lombardy aſſumed an independence which they have ever ſince retained. The pope, in 877, was re-conducted to Italy by Boſon, ſon-in-law to Louis II. of France, whom the pontiff would willingly have raiſed to the dignity of king of the country, but he found his intereſt inſufficient for the purpoſe, and matters remained in their former ſituation. The nobles became reconciled to the pope, but they renounced the authority of any ſuperior, and every one claimed to be an independent ſovereign of his own territories: they even applied to the pope, and requeſted him to join in aſſerting the independency of Italy, and obtained from his holineſs the two following decrees; *viz.* That the popes, after their election, might be conſecrated, without waiting for the preſence of the king, or his ambaſſadors; and that if Charles the Groſs died without ſons, the kingdom of Italy, with the title of emperor, ſhould be conferred on ſome Italian nobles. The emperor felt himſelf neglected and inſulted, and complained bitterly of being deprived of his right, and the diſſentions between the Italian nobles became more fatal than ever. Two of theſe noblemen, Berengarius, duke of Friuli, and Guido, or Vido, duke of Spoleto, entered into an agreement, that on the death of the emperor, the former ſhould ſeize the kingdom of Italy; and the latter on the kingdom of France. Berengarius ſucceeded without oppoſition, but Guido was diſappointed: upon this he returned to Italy, and turned his arms againſt Berengarius, whom he drove into Germany, and obtained for himſelf the kingdom of Italy. He now employed himſelf in reforming the abuſes of the ſtate, and confirming the grants formerly allowed the pope, out of gratitude for his having ſanctified his uſurpation, and declared him lawful king of Italy. After the death of Guido, Berengarius became king of Italy, without a rival, and held his kingdom during the ſpace of twenty years. In 924 he was treacherouſly aſſaſſinated at Verona. In 947, after the kingdom had undergone many changes, and ſuffered much from the incurſions and cruelties of the Hungarians, Berengarius, grandſon of the firſt king of that name, became poſſeſſed of the ſupreme power. He did not aſſume the title of king till after the death of Lotharius, which happened in 950; and in the mean time Italy was invaded by the united forces of Bavaria and Hungary. So formidable was their power, that Berengarius was obliged to purchaſe their departure with a large ſum of money, which he raiſed by a very heavy perſonal tax laid upon every individual, without diſtinction of age or ſex. In theſe efforts, Berengarius was more oppreſſive to his people than even the enemy had been: he, however, raiſed an immenſe ſum of money, ten buſhels of which he gave to the Hungarians, but kept the much larger portion for himſelf. After this he was attacked by Otho, king of Germany, who allowed him to retain his kingdom upon the hard condition of doing homage for it to the king of Germany. Berengarius did not readily ſubmit to his fate: he rebelled againſt Otho, who, determined to ſupport his authority by force of arms, brought an army into Italy, and was himſelf crowned king by the archbiſhop of Milan, and in the following year he received the crown from the hands of the pope. On this occaſion, the holy pontiff and Otho went together to the altar of St. Peter, and bound themſelves by a ſolemn oath; the pope to be always faithful to the emperor, and Otho to conſult the welfare of the church, and to reſtore to it all its patrimony granted by former emperors. Otho beſtowed rich preſents on the church, but he likewiſe ordained that the election of the popes ſhould be according to the canons: that the elected pope ſhould not be conſecrated till he had publicly promiſed, in the preſence of the emperor's commiſſaries, to obſerve every thing formerly ſpecified with regard to the rights of the emperors; that theſe commiſſaries ſhould conſtantly reſide at Rome, and make a report every year as to the manner in which juſtice was adminiſtered by the judges; and in caſe of any complaints, the commiſſaries ſhould lay them before the pope; but if he neglected to attend to them, then the imperial commiſſaries might take what ſteps they pleaſed. Thus, however much Otho might allow the pope's ſupremacy in ſpirituals, he plainly aſſumed the ſovereignty in temporals to himſelf, and thus Italy was, for upwards of 300 years, accounted a part of the German empire. This long period we ſhall of courſe almoſt entirely paſs over in this ſketch. We find, in 1215, Frederic II. acknowledged emperor, and crowned at Aix-la-Chapelle. Shortly after this he was urged by the pope to undertake an expedition into the Holy Land againſt the infidels, but he refuſed, under various pretences, obedience to the mandate of his holineſs, which cauſed the moſt decided hoſtilities between theſe great perſonages. Frederic renounced all correſpondence with the pope, and ſet his power at defiance. The pope, convinced of his error, or at leaſt of his not being able to ſupport his power againſt that of the emperor, thought proper to ſoothe him by ſubmiſſive apologies and gentle exhortations. They were accordingly reconciled. The pope ſhortly after this died; and Frederic, during the popedom of Gregory IX., undertook an expedition to the Holy Land, leaving the affairs of Italy to the management of Renaldo duke of Spoleto. The pope, hearing of his determination, prohibited his departure before he ſhould be abſolved from the cenſures of the church; but Frederic went in contempt of the church, and his ſucceſs was very complete. The ſultan ceded to him Jeruſalem, and its territory as far as Joppa. Frederic had before acquired, by marriage, the title of "king of Jeruſalem;" and now, by his moderation and great talents, he acquired the territory, to which were added Bethlehem, Nazareth, and all the country between Jeruſalem and Ptolemais, Tyre, Sidon, and the neighbouring territories: in return for which, the emperor granted the Saracens a truce for ten years; and in 1230 he returned to Italy. The reign of this prince, after his return from the Eaſt, was one continued quarrel with the popes. He was excommunicated by Gregory IX.; and in his turn he proclaimed every where that Gregory was the "great dragon," the predicted "man of ſin," the "antichriſt," &c. In 1250, Frederic, after various troubles, died. From this time, the affairs of Germany fell into the utmoſt confuſion; and Italy continued long in the ſame diſtracted ſtate in which he left it. Conrad, the ſon of Frederic, aſſumed the imperial dignity; but after his death, there were ſeveral candidates for the high honour. No emperor, however, was properly acknowledged till 1273, when Rodolph, count of Hapſburg, was unanimouſly raiſed to the vacant throne. During the interregnum which preceded the election of Rodolph, Denmark, Holland, and Hungary, entirely freed themſelves from the homage they were accuſtomed to pay to the empire; and about the ſame time, ſeveral German cities erected a municipal form of government, which continued till within theſe few years. Lubec, Cologne, Brunſwick, and Dantzick, united for their mutual defence, againſt the encroachments of the great lords, by a well-known aſſociation, called the Hanſeatic league; and theſe towns were afterwards joined by eighty others, belonging to different ſtates, which formed a kind of commercial republic. Italy alſo, during this period, aſſumed a new plan of government. From the time of Frederic II. we may date the [illegible] German power in Italy. The Florentines, the Piſans, the Genoeſe, the Luccans, &c. became independent. At the commencement of the fourteenth century, Henry VII. undertook to reſtore the imperial power in Italy. For this purpoſe a diet was held at Francfort, where ſupplies being granted for the emperor's journey, well known in hiſtory by the name of the "Roman expedition," he ſet out for Italy, which was at this period divided by the factions of the Guelphs and Gibellines, who were deſtroying one another without humanity or remorſe. Pope Clement V. had been obliged to leave Rome, which was in a ſtate of anarchy; and owing to the diviſions in that city, the holy pontiffs long took up their reſidence in France, ſo that Rome ſeemed equally loſt to the popes and the emperors. Sicily was in poſſeſſion of the houſe of Arragon, in conſequence of the maſſacre called the "Sicilian veſpers," which delivered that iſland from the tyranny of the French. Carobert, king of Hungary, diſputed the kingdom of Naples with his uncle Robert. The old league of the Italian cities no longer ſubſiſted. It had been formed with no other view than to oppoſe the emperors; and ſince they had neglected Italy, the cities were wholly employed in aggrandizing themſelves at the expence of each other. In the midſt of theſe troubles, Henry VII. appeared in Italy in 1311, and cauſed himſelf to be crowned king of Lombardy at Milan. But the Guelphs had concealed the iron crown of the Lombard kings, as if they regarded the right of reigning as attached to a circlet of metal. Henry, however, was not to be put off under ſuch a pretence: he ordered a new crown to be made, with which the royal ceremony was performed. Henry was unable to reſtore the imperial power in Italy, and his reign was terminated in a few months. From this time, the authority of the emperor in that country conſiſted, in a great meaſure, in the conveniency which the Gibellines found in oppoſing their enemies under the ſanction of his name. The power of the pope was of the ſame nature, and he was probably leſs regarded in Italy than in any other country in Chriſtendom. There was likewiſe a party who called themſelves Guelphs; but they affected this diſtinction only to keep themſelves independent of the imperialiſts. The moſt deſperate wars were carried on by the different cities againſt each other: but it would be contrary to our plan to attempt to give a detail of them; and this is the leſs neceſſary, as nothing material was effected by their valour. By degrees this martial ſpirit ſubſided; and in the year 1492, the Italians were ſo little capable of reſiſting an enemy, that Charles VIII. of France conquered the whole kingdom of Naples in ſix weeks; and he might eaſily have ſubdued the whole country, if it had not been for his own imprudence. Another attempt on Italy was made by Louis XII.; a third by Francis I.; and during the reigns of Louis XIII. and XIV., an obſtinate war was carried on between the French and the Spaniards, in which the Italian ſtates bore a conſiderable ſhare. The war concluded in 1660, with very little advantage to the French, who had never been very ſucceſsful in their Italian wars. A ſimilar want of ſucceſs attended them in the war which commenced fourſcore years afterwards: but the farther particulars relating to theſe other conteſts belong properly to the hiſtory of the different ſtates into which that country was divided.

At preſent, the whole of Italy is ſubject to the control of the French emperor, who led his victorious troops over the Alps, and made himſelf maſter of the Auſtrian dominions in Italy. The battle of Lodi decided the fate of Lombardy. Verona, Tortona, Bologna, and Urbino, quickly yielded to his arms. He even menaced imperial Rome. The pope, incapable of reſiſting his power, begged for peace, which was granted him on the humiliating conditions, that his holineſs ſhould ſurrender to the conquerors a great many pictures, and ſtatues, and a multitude of curious MSS. from the Vatican. With theſe the general was for the preſent content: he retired from Rome, perhaps, however, deſirous of ſome new cauſes to enable him to enrich his country with farther ſpoil. A pretence was ſoon given him. He had ſcarcely reached the boundaries of France, when he learned that the terms of the treaty had been wantonly broken by the ſubjects of his holineſs. In the following year, 1797, he entered Italy again, and in one battle, well conteſted, decided the fate of the eccleſiaſtical ſtate. The banners of France now waved triumphant over the patrimony of the church. The pope was obliged to ſubmit to whatever terms the conqueror ſhould dictate. He agreed to the ceſſion of Avignon, part of Venice, the cities and territories of Bologna, Ferrara, and Romagna: and to prevent the future power of the Roman pontiffs, the newly ceded territories, together with Reggio and Modena, were formed into one republic called the Ciſalpine, and afterwards the Italian republic; while the Milaneſe, and other diſtricts of Lombardy, were formed into another called the Ligurian republic. Thus the power and importance once annexed to the ſee of Rome were annihilated, and the influence of France in Italy eſtabliſhed on the ſureſt foundation. In 1801 the Italian republic was, at the deſire of Bonaparte, divided into twelve departments. We have ſeen, under the article France, in what manner Bonaparte, as well by a train of fortunate circumſtances, as by his talents, obtained the honours of a conſulſhip, in imitation of the office held in ancient Rome; and how he advanced from ſtep to ſtep, till he was proclaimed "emperor of the French," with unlimited powers. This event occurred on the 2d of December 1805, when he ſwore in the preſence of the pope (Pius VI.), whom he had brought to Paris to be the witneſs of his own humiliation, "to govern ſolely with a view to the intereſt, the happineſs, and glory of the French nation." He boldly aſſerted, in the preſence of all the principal perſonages then aſſembled, that he aſcended the throne by the unanimous wiſhes of the ſenate, the people, and the army, whoſe happineſs or miſery had conſtituted, and would for ever conſtitute the ſources of his own pleaſures and pains. "My deſcendants," ſaid he, "ſhall long preſerve this throne. In the field, they will be the firſt ſoldiers of the army, ſacrificing their lives for the defence of their country. As magiſtrates, they will never forget that contempt of the laws, and the confuſion of ſocial order, are only the reſult of the imbecility and uncertainty of princes." The ſplendour of this ſhow was introductory to a ſimilar diſplay in Italy. He had before been regarded as the chief of the Italian republic; but the name of a republic probably carried with it ideas abhorrent to his heart, and the very word grated on his ears. In the month of April 1805, he aſſumed at Milan the title of "king of Italy:" in this city he placed the iron crown on his own head, while ſenators from almoſt all the ancient ſtates were aſſembled as witneſſes of his elevation, and their own degradation. On this occaſion he related all that he had done as a conqueror and a great ſtateſman; ſaying, that the power of the French empire had nevertheleſs been ſurpaſſed by the moderation which preſided in its political tranſactions. "We had conquered," ſaid he, "Holland, three-fourths of Germany, Switzerland, all Italy; but of ſo many provinces, we have only kept what was neceſſary to preſerve us at the ſame point of conſideration and power which France has always poſſeſſed. The partition of Poland, the loſſes ſuſtained by Turkey, the conqueſt of the Indies, and almoſt all our colonies, had deſtroyed the balance of power to our diſadvantage." He next recounted all his glorious deeds, and all his generoſity with regard to Germany, Holland, and Switzerland; and adds, "The union of the Italian republic to the French would have been an advantage to our agriculture; nevertheleſs, after the ſecond conqueſt, we, at Lyons, confirmed its independence. We now do more. We proclaim the principle of the ſeparation of the crowns of France and Italy, by fixing for that ſeparation the moment it can be done, and without danger to our people of Italy. We have accepted, and will place upon our head, the iron crown of the ancient Lombards, in order to re-temper and conſolidate it; ſo that it may not be broken by the ſhocks by which it will be threatened, as long as the Mediterranean continues out of its habitual ſtate. But we do not heſitate to declare, that we will transfer that crown to one of our children, natural or adopted, the moment we are freed from alarms for that independence which we have guaranteed to the other ſtates of the Mediterranean." Upon the return of the emperor to his own dominions, it was announced to him that the Ligurian ſenate was waiting for an interview upon very important buſineſs. Accordingly, on the 25th of May, an extraordinary ſitting of the Ligurian ſenate was held, when it was decreed that Genoa, its territories, and dependencies, ſhould be annexed to the French empire. In his ſpeech on this occaſion, the emperor, having dwelt much at large on the advantage which would accrue to the continent in general, and to Genoa in particular, from this addition to his own dominions, added, "I will realize your expectations; I will unite you to my great people. I ſhall thereby acquire additional means of rendering that protection more powerful, which I have always been diſpoſed to extend to you. My people will with pleaſure receive you. They know that at all times you have been friendly to their armies; and that you have aſſiſted them with all your force, and with all your means. They find, moreover, in your territory, ports, and an increaſe of maritime power, which is neceſſary for the ſupport of their lawful rights againſt the tyrants of the ſeas.—Doge, and gentlemen of the deputation of the ſenate, and people of Genoa, return to your native country: I ſhall be there ere long, and will confirm the union which you and my people are about to form." At this meeting of the Italian legiſlature, the emperor preſented prince Eugene Beauharnois to them as his repreſentative, and viceroy of Italy; ſaying, that he himſelf would take an early opportunity of viſiting all the departments of his new kingdom, in order that he might become better acquainted with their various wants. Since that period, in conſequence of the ſucceſs attendant on the wars between France and Auſtria, which were terminated by the treaties of peace of Preſburg and Vienna, the whole Venetian territory, which pertained to Auſtria, the county of Gortz or Goritia, the city of Trieſte, Carniola, with its dependencies on the gulf of Trieſte, and all the territories lying on the right bank of the Save, from the point where that river leaves Carniola, along its courſe to where it touches the province of Boſnia, ſix diſtricts of military Croatia, Fiume, the Hungarian Littorale, Auſtrian Iſtria, together with the iſlands dependent upon the ceded territory, were added to the Italian dominions of the new emperor and king. On the 20th of March 1811, Bonaparte had a ſon born by his preſent empreſs, the daughter of the emperor of Germany. To this ſon he inſtantly gave the title of "king of Rome," and required his miniſters, and the chief perſons under his direction, to render due homage to the infant in his cradle: thus ſhewing that he meant the prince Eugene, above noticed, only as his repreſentative till one of his own children ſhould be fitted to ſway the ſceptre of the Italian kingdom. Cellarius's Anc. Geog. Univer. Hiſt. Anc. and Mod. Geographies of Pinkerton, Playfair, and Smith. Holberg's Univer. Hiſt. And Public Papers in the ſeveral volumes of the New Ann. Regiſter.

In the fifteenth century, when we firſt hear of harmony in four parts, and maſſes ſet to figurative muſic, it was for the uſe of the pope's chapel that the greateſt efforts of genius in compoſition were excited among the candidates for favour in that art, by the double certainty of having their labours liberally rewarded, and their productions well performed. And if we find that many of the compoſers of the pontifical chapel were Netherlanders, and the ſingers Spaniards, it does not neceſſarily follow that the Italians had either counterpoint, or the art of ſinging, from the Low Countries, or from Spain. The Roman college of ſingers had been eſtabliſhed and celebrated during ſo many ages, that we may as well imagine theſe foreigners went to Rome to *learn* muſic, as to *teach* it.

We know, in later times, that many of the greateſt muſicians of Europe have either had their education in Italy, or thought it as neceſſary to viſit that country as the ancient Roman philoſophers to travel into Greece, or the Grecians into Egypt. Orlando di Laſſo, Handel, Haſſe, Gluck, and J. C. Bach, went thither very early, and may be ſaid to have formed their ſtyles on the beſt models of that country. The firſt motets of Orlando that were publiſhed at Antwerp, by Tylman Suſato, 1555, were ſaid to be made "à la nouvelle compoſition d'aucuns d'Italie;" as the firſt productions of Handel, that were publiſhed in England, were ſaid to be compoſed "by an eminent *Italian* maſter;" Haſſe went very young into Italy, and was a ſcholar of Aleſſandro Scarlatti; however, his clear and graceful ſtyle more reſembled that of Vinci and Pergoleſi, his competitors in the natural, ſimple, and elegant manner of writing for the voice, than that of either Scarlatti, his maſter, or Kaiſer, his countryman, and firſt model. The late excellent compoſer, Mr. J. C. Bach, ſon and brother of two of the greateſt muſicians that ever exiſted, is allowed to have been a fine player on keyed inſtruments, before he went into Italy; but his vocal muſic is certainly more in the ſtyle of Italy, than of his native country.

If the great muſicians of antiquity, whoſe names are ſo familiar to our ears, had not likewiſe been poets, time and oblivion would long ſince have ſwept them away. But theſe having been luckily writers themſelves, took a little care of their own fame; which their brethren of after-ages gladly ſupported for the honour of the *corps*.

But ſince writing and practical muſic have become ſeparate profeſſions, the celebrity of the poor muſician dies with the vibration of his ſtrings; or if, in condeſcenſion, he be remembered by a poet or hiſtorian, it is uſually but to blazon his infirmities, and throw contempt upon his talents. The voice of acclamation, and thunder of applauſe, paſs away like vapours; and thoſe hands which were moſt active in teſtifying temporary approbation, ſuffer the fame of thoſe who charmed away their care and ſorrows in the glowing hour of innocent delight, to remain unrecorded.

If it be true that the progreſs of muſic in every country depends on the degrees of civilization and culture of other arts and ſciences among its inhabitants, and on the language which they ſpeak, the accents of which furniſh the ſkeleton and nerves of all vocal melody; great perfection cannot be expected in the muſic of Europe during the middle ages, when the Goths, Vandals, Huns, Germans, Franks, and Gauls, whoſe ideas were ſavage, and language harſh and inſolent, had ſeized on its moſt fertile provinces. All the dialects that are now ſpoken in Europe are a mixture of Celtic and Latin; and as the inhabitants of Italy preſerved the Roman language longer than thoſe of other countries remote from the ſeat of empire, more veſtiges of the Latin tongue ſtill remain in Italy than elſewhere. For though there are many terms in it that they were forced to receive from the barbarians who invaded them, yet the chief part of the language is ſtill Latin corrupted, and ſometimes ſoftened and improved. And as literature, arts, and refinements, were encouraged more early in Italy at the courts of the Roman pontiffs, than in any other country, modern muſic has thence been furniſhed with its ſcale, its counterpoint, its beſt melodies, its religious and ſecular dramas, and with the chief part of its grace and elegance. Italy, in modern times, has been to the reſt of Europe what ancient Greece was to Rome; its inhabitants have helped to civilize and poliſh their conquerors, and to enlighten the minds of thoſe whoſe ſuperior force and proweſs had frequently enſlaved them.

ITANBERA, a town of Brazil, in the government of Minas Geraes; 36 miles W. of Villa Rica.

ITANNA, or ESTENNA, a kingdom of Africa, on the Slave coaſt, ſubject to Benin.

ITAPE, a town of South America, in the province of Paraguay; 90 miles S.E. of Aſſumption.

ITAPUA, a town of South America, in the province of Paraguay, on the Parana; 170 miles S.E. of Aſſumption.

ITATA, a town of South America, in the country of Chili, on a river of the ſame name; 32 miles N.N.E. of La Conception.

ITATI, a town of South America, in the province of Buenos Ayres, on the Parana; 35 miles N.E. of Corrientes.

ITCH, in *Medicine*, a contagious diſeaſe of the ſkin, which is characterized by an eruption of numerous ſmall puſtules, more eſpecially about the fingers, wriſts, and the bending of the joints, accompanied by the moſt importunate itching, without fever.

This diſeaſe ſeems to have been included, together with the running, or moiſt tetter, under the appellation of *ulcerating pſora*, (ψωρα ἑλκώδης) of the Greeks, and conſtituted one form of the *ſcabies* of the Latin writers. In the writings of the moderns, it is ſometimes denominated *pſora*, but more frequently *ſcabies*; the term *pſora*, indeed, when uſed by the Greeks without any epithet, ſignified the ſcaly tetter, which is analogous to their *lepra*, (ſee Willan on Cutaneous Diſeaſes, Order ii. Genus 2.) and not a puſtular diſeaſe.

The eruption of ſcabies begins moſt commonly on the limbs, and eſpecially about the wriſts and fingers, in the form of minute puſtules or watery pimples, which are accompanied by a ſenſation of violent itching, which is greatly increaſed by external warmth, and therefore is particularly troubleſome ſoon after the patient gets into bed. It aſſumes, however, a conſiderable variety of forms, in different inſtances, and even in different ſtages, of the complaint, which the vulgar have noticed, and diſtinguiſhed by particular appellations. What they denominate the *rank itch*, is often ſeen early in the progreſs of the diſorder, or in mild caſes; and conſiſts of a numerous crop of pimply eruption, which ſpreads over the whole body, arms, breaſt, and lower extremities; but, on the trunk of the body eſpecially, the characteriſtic ichorous puſtule commonly appears here and there intermixed with the papulæ, and the final tendency of the eruption is to the puſtular form. In other caſes, large watery veſicles are ſeen diffuſed over the thighs, arms, hands, and region of the ſtomach; in which caſe the diſeaſe is popularly termed the *watery itch*. And not unfrequently the eruption over the arms, wriſts, and fingers, conſiſts of large, yellow puſtules, which become confluent, and form cruſts or ſcabs as the matter dries; this has been termed the *pocky itch*, not from its connection with any ſyphilitic contagion, as ſome have been led to imagine from the term; but from the reſemblance of the puſtules to thoſe of the diſtinct ſmall-pox. Some writers have mentioned a *ſcorbutic itch*, and have included the puſtular ſyphilitic eruptions under the term *itch*; but theſe eruptions, as well as the affections of the ſkin originating from the true ſcurvy, differ eſſentially from *ſcabies* in their form, and in the abſence of that inceſſant and importunate itching, which accompanies the latter. The term *ſcorbutic itch* has ſometimes been applied to the *prurigo*, it would ſeem, when it was accompanied by a particularly irritable and inflamed ſtate of the ſkin.

The pruriginous eruptions, indeed, which Dr. Willan has deſcribed as conſiſting of pimples, which do not become puſtular in general, or diſcharge any fluid, even when the tops are rubbed off, after continuing ſome time, are apt to become puſtular and contagious; that is, to degenerate into *ſcabies*, if they are long neglected, or where cleanlineſs is not ſufficiently attended to. And there is an eruption, which is not very uncommon, partaking, in its appearances, of the character of *prurigo* and *impetigo* conjoined, which is contagious in its double character, and exceedingly obſtinate. In work-houſes, moreover, a virulent ſcabies is often ſeen, which appears to be a mixture of the poiſon of *porrigo* with that of itch, and which affects the whole body, with ſcabby and itching ulcerations, that are communicated by the contagion, under the ſame form. In ſhort, it is extremely difficult to point a certain diagnoſis of the *ſcabies*, from the variety of forms under which a contagious and puſtular eruption appears, under different circumſtances. See PRURIGO.

The itch is moſt frequently communicated from one perſon to another by contagion, that is, by actual contact; as by ſleeping, ſhaking hands, &c. with a perſon affected, or by uſing the clothes, linen, &c. which had been previouſly uſed by ſuch a perſon. But in ſome caſes it ſeems to originate in individuals, who neglect or do not poſſeſs the proper means of cleanlineſs, and in others is the reſult of the converſion of the papulous diſeaſes (the lichen and prurigo of Dr. Willan's arrangement) into a puſtular diſeaſe. When the complaint is communicated by contact with the perſon or clothes of one already infected, it is doubtleſs commonly conveyed by a ſort of inoculation of the ichorous or purulent matter, diſcharged from the puſtules. Some, however, have attributed the diſeaſe itſelf, as well as the ready propagation of it, to the exiſtence of certain minute inſects, which breed in the furrows of the cuticle, and which are conveyed from one perſon to another by ſuch intercourſe as we have juſt mentioned. Bonomo, an Italian phyſician, was one of the firſt to deſcribe this inſect, and his account was made known in England by Dr. Mead. (See Philoſ. Tranſ. vol. xxiii.) It has been ſince called the *acarus ſcabiei*, and has been particularly deſcribed and figured by Degeer (Hiſt. des Inſectes), and others. Linnæus conſidered it the ſame with the acarus or mite, which breeds in flour; but Degeer has ſhewn this to be a miſtake. Theſe inſects, which we confeſs we have never been able to detect in any caſe of ſcabies, are ſaid to be found, not in the large puſtules, but in the recent watery puſtules, or ſtill more commonly in the furrows of the cuticle, near them, on the hands and fingers.

Cure.—A great variety of remedies have been employed at different times for the cure of this filthy complaint; and in general, indeed, it is not very difficult of cure, although the remedy is alſo filthy like the diſeaſe. Sulphur, both taken internally, in combination with ſome neutral or alkaline ſalt, and applied externally over the parts affected, in the form of an ointment, is found to be the moſt certain and efficacious remedy. The white hellebore, applied either in an ointment, or in a ſtrong decoction as a lotion, has conſiderable influence over the diſeaſe; and ſome of the preparations of mercury, ſuch as the white precipitate, the oxymuriate, or corroſive ſublimate, &c. as well as the muriate of ammonia, potaſh in a ſtate of a deliqueſcence, &c. are alſo occaſionally reſorted to, in various combinations, with ſucceſs. A number of other medicines, both external and internal, are recommended by the older writers, eſpecially the juices and decoctions of ſeveral roots and plants; but it ſeems altogether unneceſſary to enumerate them, ſince recent experience has decided upon the ſuperior efficacy of the remedies juſt mentioned. See Turner on Dif. of the Skin. Calliſen. Syſt. Chir. Hodeira. § 824. Sauvages, Noſol. Meth. Claſs x. Gen. 28.

Itch *Animal*, a creature ſaid to be found in the puſtules of the itch; it is a ſpecies of acarus.

ITCHAPOUR, in *Geography*, a town of Hindooſtan, in the circar of Ellichpour; 48 miles S.S.W. of Ellichpour. N. lat. 20° 28′. E. long. 77° 38′.—Alſo, a town of Hindooſtan, in the circar of Cicacole; 30 miles S.S.W. of Ganjam.

ITCHAUR, a town of Hindooſtan, in the circar of Hindia; 30 miles N. of Hindia.

ITCHE, a town of Thibet; 95 miles S.W. of Chatcheou.

ITCHING River, in Hampſhire, is navigable for barges up to Wincheſter city, of which an account has been given in our article Canal: ſince which, there have been attempts, and one is now making, for obtaining an act for further improving this navigation. About 1802, a bridge was built over this river at Northam. At Wood mills, on this river, ſhips' blocks are manufactured by machinery, but in a manner far leſs complete and ingenious than the block machines by Mr. Brunell, which are erected in the dock-yard at Portſmouth, of which we intend to give ſome account under our article *Block* Machinery.

ITCHORSKA, a town of Ruſſia, in the government of Irkutſk, on the Lena; 80 miles N.E. of Kirenſk.

ITEA, in *Botany*. Ιτεα of the ancient Greeks is a general appellation for willows or ſallows, as appears from Theophraſtus and Dioſcorides. The word is derived from παρα το ιεναι, alluding to their quick growth, or early germination.—Linnæus applied the name to this North American genus from its willow-like aſpect.—Linn. Gen. 109. Schreb. 150. Willd. Sp. Pl. v. 1. 1146. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. 37. Juſſ. 159. Lamarck Dict. v. 3. 314. Illuſtr. t. 147. (Cyrilla; Linn. Mant. 50. Syſt. Veg. ed. 14. 241. Schreb. 150.) Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Bicornes*, Linn. *Rhododendra*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, erect, very ſmall, permanent, divided into five acute, coloured ſegments. *Cor.* Petals five, lanceolate, long, inſerted into the calyx. *Stam.* Filaments five, awl-ſhaped, erect, the length of the corolla, inſerted into the calyx; anthers roundiſh, incumbent. *Piſt.* Germen ſuperior, ovate; ſtyle cylindrical, permanent, as long as the ſtamens; ſtigma obtuſe. *Peric.* Capſule ovate, much longer than the calyx, terminated by the ſtyle, of two cells, and two valves with inflexed edges, gaping at the top. *Seeds* numerous, very ſmall, oblong, ſhining.

Eſſ. Ch. Petals long, inſerted into the calyx. Capſule of one cell, and two valves.

Obſ. L'Heretier has the honour of having firſt declared the *Itea* and *Cyrilla* of Linnæus to be one and the ſame genus, from the conformity of the flower, and two-celled fruit of each.

1. I. *virginica*. Linn. Sp. Pl. 289. Trew. Ehret. 55. t. 98.—"Leaves ovate, acute, ſerrated."—A native of North America, flowering from June to Auguſt.—This *ſhrub* riſes to the height of five or ſix feet. Its *ſtem* is branched all the way up. *Leaves* ſlightly ſerrated, reflexed, light green. *Flowers* white or yellowiſh, compoſed of numerous ſpikes three or four inches long.—Linnæus remarks that this ſpecies is very ſimilar in appearance to *Prunus Padus*, the Bird-cherry.

2. I. *Cyrilla*. Willd. n. 2. L'Herit. Stirp. faſc. 6. 137. t. 66. (Cyrilla racemiflora; Linn. Mant. 50. Jacq. Ic. Rar. 1. t. 47.)—"Leaves lanceolate, entire, membranaceous."—A native of Carolina. It flowers in July and Auguſt.—*Root* perennial. *Stem* ſparingly branched, round, aſh-coloured. *Leaves* alternate, bluntiſh, rather undulated; their foot-ſtalks reddiſh. *Cluſters* numerous, lateral, from four to ſix inches long. *Flowers* ſcattered, white; anthers pale-violet coloured; germen whitiſh.

Itea, in *Gardening*, contains plants of the hardy, deciduous, ſhrubby kinds, of which the ſpecies moſtly cultivated are, the Virginian itea (I. virginica); and the entire-leaved itea (I. cyrilla).

Method of Culture.—The firſt ſort is capable of being increaſed by layers, which ſhould be laid down in the autumn, when they will put out roots ſo as to be fit to take off by the following autumn, when they may be removed into the nurſery, or the places where they are to grow. It does not ſucceed well on dry gravelly ſoils.

It is alſo capable of being raiſed from ſeed, by ſowing it in the ſpring, as ſoon as procured from abroad.

The ſecond ſpecies may be increaſed by layers or cuttings, planted in pots of good mould in the ſpring; in the latter caſe, placing them in a mild hot-bed, till they have ſtricken root, afterwards removing them into ſeparate pots, placing them in airy ſituations in the green-houſe or other proper place.

Plants of the firſt kind are very ornamental in the borders and clumps, and thoſe of the latter among green-houſe collections, or thoſe in other protected places.

ITENG, in *Geography*, a ſmall iſland in the Eaſt Indian ſea. S. lat. 6° 42′. E. long. 132° 15′.

ITERATION. See Reiteration.

ITERI, in *Geography*, a town of the iſland of Sardinia.

ITFU, a town of Egypt; 8 miles S. of Tahta.

ITHACA, a town of New York, at the ſouthern extremity of lake Cayuga; 30 miles S. of Cayuga. N. lat. 42° 27′. W. long. 76° 33′.

Ithaca, in *Ancient Geography*, one of the Greek iſlands, ſituated in the Ionian ſea, between Dulichium and Capalenia, famous for being the birth-place of Ulyſſes, the ſon of Laertes. It had the advantage of a town and a good port: it is now called "Theaki," and its port "Vahti." Its circuit is reckoned about 40 miles. Some ruins ſtill remain, which tradition reports to have been part of the palace of Penelope.

ITHCYPHOS, in *Surgery*, curved or deformed in the back.

ITHOME, in *Ancient Geography*, a town of Meſſenia, north of Meſſene, ſo called from the mountain on which it was erected and well fortified, being encompaſſed with a ſtone wall. In it was a ſtatue of Jupiter the "Saviour," and alſo a fountain called Arſinoe, which was ſupplied with water from another fountain called Clepſydra. Neptune and Venus had each of them a temple in this place; and the mother of the gods had a ſuperb ſtatue of Parian marble. This town contained alſo a temple dedicated to Meſſené, daughter of Triopas, whoſe ſtatue was formed partly of gold and partly of the marble of Paros. It had likewiſe a temple, in which were depoſited and preſerved the victims appropriated to the ſacrifices. Beſides, it was adorned with all the ſtatues of the gods which were worſhipped in Greece. It had a theatre which had been a temple dedicated to Serapis and Iſis. The citadel was conſtructed on the ſummit of the mountain, and at the gate by which they paſſed to Megalopolis was a ſtatue of Mercury.

Jupiter was worſhipped in this place under the appellation of "Ithomatus" by the people of Meſſenia: and as they pretended that he had been educated in their country, they appropriated to him a peculiar worſhip; and while the feſtival, called "Ithomæa" laſted, they were accuſtomed to carry water during the whole day from the fountain Clepſydra into his temple. Games accompanied this feſtival, and alſo trials of ſkill on various inſtruments of muſic: Pauſan. in Meſſen.

ITHYNTERION, ἰθυντήριον, in *Antiquity*, a ſtaff of laurel, which prophets uſually carried in their hands, otherwiſe called *ſceptron.*

ITHYSCOLIOS, in *Surgery*, an oblique curvature of the ſpine.

ITINERANT JUDGES, or *Juſtices*, ſuch as were formerly ſent with commiſſions into divers counties, to hear chiefly thoſe cauſes called *pleas of the crown:* the ſame with what are otherwiſe called *juſtices in eyre.* See JUSTICE.

ITINERARIUM, in *Surgery*, a name given by Hildanus, and many other writers, to a ſtaff uſed in the operation of cutting for the ſtone.

ITINERARY, the deſcription a traveller gives of the courſe of his journey, and of the curioſities, &c. he obſerved therein.

The Itinerary of Antonine ſhews all the grand Roman roads in the empire, and all the ſtations of the Roman army. It was drawn up by order of the emperor Antoninus Pius; but is now very defective, having ſuffered much under the hands of the copyiſts and editors.

ITINERARY *Column.* See COLUMN.

ITING, in *Ornithology.* See GRACULA *Calva.*

ITIOBARA BAY, in *Geography*, a bay on the coaſt of Brazil. S. lat. 6° 20′. W. long. 37° 46′.

ITIUM PROMONTORIUM, in *Ancient Geography*, a promontory of Gaul, mentioned by Ptolemy, and ſuppoſed to be at the mouth of the Somme, in France, and extending towards the north. According to D'Anville it is Griſsneſs.

ITIUS PORTUS. See ICCIUS *Portus.*

ITKARINSKOI, in *Geography*, a town of Ruſſia, in the government of Kolivan; 156 miles E.N.E. of Kolivan. N. lat. 55° 36′. E. long 85° 44′.

ITONA, in *Ancient Geography*, a town of Epirus.—Alſo, a town of Italy.—Alſo, a town of Aſia Minor, in Lydia.—Alſo, the name of two places, one in Bœotia, the other in Lydia.

ITORUM URBS, a town of Italy, on the route from Otricoli to Rimini, near the mountains; mentioned by Strabo.

ITRABO, in *Geography*, a town of Spain, in the province of Granada; 10 miles W.N.W. of Motril.

ITRI, a town of Naples, in the province of Lavora; 3 miles S.E. of Fondi.

ITSJA, a town of Japan, in the iſland of Ximo; 10 miles N. of Taiſero.

ITTENDAL, a town of Sweden, in the province of Helſingland; 15 miles N. of Hudwickſwal.

ITTERGAU, a fertile diſtrict of Upper Heſſe, watered by the Itter, which runs into the Eder, two miles S. W. of Vohle.

ITTER THAL, ITTER-EN-VAL, or *Bergſtadt*, a town of Upper Heſſe; 24 miles W. of Caſſel.

ITTIGIUS, THOMAS, in *Biography*, who flouriſhed in the ſeventeenth and eighteenth centuries, was born at Leipſic about the year 1654. Here he purſued his ſtudies, and was afterwards appointed aſſeſſor of the faculty of philoſophy at the ſame place. Being admitted to the miniſtry, he diſcharged the duties of that office in different churches in that city. In 1686, he was admitted to the degree of doctor of divinity, and in the following year he was appointed firſt profeſſor extraordinary in that faculty, and then profeſſor in ordinary. He took a conſiderable ſhare in publiſhing the "Leipſic Acts," and beſides other employments, filled the poſt of ſuperintendant of the eccleſiaſtical diſtrict of that city. He died in 1710: and was author of "A Treatiſe on Burning Mountains;" "Diſſertatio de Hæreſiarchis Ævi Apoſtolici, eique proximi;" "Prolegomena ad Joſephi Opera," and many other works, which were highly eſteemed by his contemporaries. Lardner, in his ſeventh vol. ſpeaks of him as the very learned Ittigius. The ſame author refers to his opinion in other places. Moreri. Lardner.

ITU, in *Geography*, a town of South America, in the province of Buenos Ayres, on the Parana; 130 miles E. of Corrientes.

ITUCI, in *Ancient Geography*, a town of Hiſpania, in Bœtica, a little ſouth of Caſtulo, and north of Eliberis; called by Pliny "Virtus Julia."

ITUERO, in *Geography*, a town of Spain, in the province of Leon; 13 miles S.S.W. of Civdad Rodrigo.

ITUNA, in *Ancient Geography*, an eſtuary of Britain, which is unqueſtionably the Solway Firth, which now divides England from Scotland on the weſt ſide.

ITUREA, a provice of Aſia, ſo called from Itur, the ſon of Iſhmael, ſometimes erroneouſly called Jetur. It was ſituated on the other ſide of Jordan, on the N. ſide of the half-tribe of Manaſſeh, between that and the territories of Damaſcus; ſo that it made one part of Cœleſyria, and lay on the ſide of Judæa, as Idumæa lay on the other. The Itureans were famous for drawing the bow, but they were a fierce people. Iturea was invaded by Ariſtobulus, who ſucceeded his father Hyrcan; but being taken ill in the midſt of his ſucceſſes, he was under a neceſſity of being brought back to Jeruſalem, and to leave his brother to complete the conqueſt of that province; an achievement which he ſoon accompliſhed, cauſing all the Itureans, either to be circumciſed and incorporated with the Jews, or elſe to depart into ſome other country.

ITURISSA, a town of Hiſpania, in the country of the Vaſcones. Ptol. In the Itinerary of Antonine it is placed 18 miles from the Pyrenees.

ITWA, in *Geography*, a town of Bohemia, in the circle of Pilſen; 3 miles N.W. of Teuſing.

ITYCA, in *Ancient Geography*, a town of Africa, in Lybia, which was a colony of Tyrians.

ITYPHALLOPHORI, in *Ancient Mythology*, attendants on the orgies of Bacchus, who accompanied the Phallophori, habited like fawns, counterfeiting perſons drunk, and ſinging, in honour of Bacchus, ſongs ſuitable to their functions. See ORGIES.

ITYS, in *Ancient Geography*, one of the rivers of Britain, which runs into the ſea oppoſite to the iſle of Skye.

ITZEHOE, in *Geography*, a town of the duchy of Holſtein. This town has a very ancient origin: it is named from a fortreſs built in the beginning of the ninth century by order of Charles the Great, iſſued in 809, to repel the incurſions of the Danes into Germany. This fortreſs was called Eſſeho, or Iſſeho. In proceſs of time it was ſurrounded by a number of houſes, which, about the middle of the 13th century, obtained the privileges of a town. It has ſince been ſeveral times deſtroyed; but is now a ſmall, agreeable, and well built town, partly ſituated on the river Stöer, which runs into the Elbe, and has been erroneouſly mentioned by ſome travellers as a canal cut from that river. It is diſtant from Hamburgh 47 miles, and 12 from Gluckſtadt. The church, which is in the market-place, is very ſmall, but the ſteeple is high, of a particularly light architecture: it ſtands on four ſmall iron pillars, which, at a diſtance, are hardly perceivable. N. lat. 53° 57′. E. long. 9° 35′.

IVA, in *Botany*, a name apparently of barbarous origin, firſt applied to a ſpecies of *Teucrium* or *Ajuga*. It does not appear why Linnæus appropriated it to the preſent genus.—Linn. Gen. 490. Schreb. 637. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 346. Juſſ. 190. Lamarck Dict. v. 3. 315. Illuſtr. t. 766. Gærtn. t. 164. (Tarchonanthus; Vaill. Act. 1719. f. 16, 17.)—Claſs and order, *Monœcia Pentandria*. Nat. Ord. *Compoſitæ Nucamentaceæ*, Linn. *Corymbiferæ*, Juſſ.

Gen. Ch. *Common Calyx* roundiſh, of about five ſubovate, obtuſe, nearly equal, permanent leaves, containing many florets. *Cor. Compound* convex, having numerous male florets in the diſk, and five female ones in the circumference; that of each of the males monopetalous, funnel-ſhaped, five-toothed, the length of the calyx; of the females wanting. *Stam.* Filaments five, ſetaceous, the length of the floret; anthers erect, approximated. *Piſt.* Germen oblong, the length of the calyx; ſtyles two, capillary, long; ſtigmas acute. *Peric.* none, except the unchanged calyx. *Seeds* ſolitary, naked, as long as the calyx, thicker about the upper part, obtuſe. *Recept.* beſet with linear ſcales.

Eſſ. Ch. Male, Common calyx of three or five leaves. Florets of the diſk monopetalous, five-cleft. Female, Corolla wanting. Styles two. Seeds naked, obtuſe.

1. *I. annua.* Linn. Sp. Pl. 1402. Schmid. Ic. 59. t. 16. "Leaves lanceolate, ovate. Stem herbaceous."—A native of South America.—This *annual* riſes to the height of five or ſix feet. *Root* fibrous, branching. *Stem* jointed, furrowed, red, hairy; pairs of oppoſite branches formed at each joint. *Leaves* oppoſite, on foot-ſtalks, ovate and pointed, veined, reddiſh above, and green underneath. *Cluſters* axillary and terminal, blueiſh, or of the ſame ruſty colour with the ſtem, interſperſed with long, pointed, ſerrated bracteas.

2. *I. fruteſcens.* Linn. Sp. Pl. 1402. (Elichryſo affinis peruvania fruteſcens; Pluk. Phyt. t. 27. f. 1.)—"Leaves lanceolate. Stem ſhrubby."—Found in Virginia and Peru. It flowers in Auguſt.—*Root* perennial. *Branches* woody, ſlender, eight or ten feet long. *Leaves* ſerrated; the branches terminated by cluſters of pale purple flowers.

Iva, in *Gardening*, compriſes plants of the hardy, deciduous, ſhrubby, herbaceous, annual kinds, of which the ſpecies commonly grown are, the annual iva (I. annua), and the ſhrubby iva, or baſtard Jeſuit's bark-tree (I. fruteſcens.)

Method of Culture.—The plants of the firſt ſort are raiſed by ſowing the ſeeds on a moderate hot-bed in the ſpring, and when they are fit to remove, placing them in another hot-bed, treating them as the leſs tender annual ſorts.

But in the ſecond ſort, the young branches ſhould be laid down in the ſpring, when they will put out roots in about ſix months; or cuttings may be planted in a ſhady border in May, and when they have taken root, removed, with earth about their roots, to the places where they are to grow. The plants ſucceed beſt in a dry ſoil, and warm ſheltered ſituation.

Plants of the firſt ſort afford ornament among the leſs tender annuals, and thoſe of the latter in the warm borders and clumps in ſhrubberies and pleaſure ground

IVAFUNE, in *Geography*, a town of Japan, in the iſland of Niphon; 30 miles S.S.E. of Nigata.

IVAHAH is the name of one of the canoes or boats uſed by the iſlanders of the South ſea, for ſhort excurſions to ſea: it is wall-ſided and flat-bottomed. See Boat.

Ivan I., Vassilievitch, John Basilowitz, in *Biography*, czar of Ruſſia, was born in 1438, and ſucceeded to the throne in 1462. At this period Ruſſia was divided into a number of petty principalities: ſome of them were ſubject to the czar or great duke, and all, together with him, tributary to the Tartars, who aſſumed a ſuperiority over that prince. The following is given as an inſtance of the ſervitude of the great duke. It is recorded by Cromer the Poliſh hiſtorian, and quoted by Coxe in his travels: "Whenever the Tartar ambaſſadors were ſent to Moſcow to collect tribute, the great duke uſed to meet them, and offer, as a mark of his reſpect, a cup of mare's milk; and if a drop chanced to fall upon the mane of the horſe on which the Tartar ambaſſador was ſitting, he would himſelf lick it up. When they reached the hall of audience, the ambaſſadors read the khan's letter ſeated upon a carpet of the choiceſt furs, while the great duke with his nobles knelt, and liſtened in reſpectful ſilence." Ivan, who may be juſtly eſteemed the founder of Ruſſian greatneſs, was a man of gigantic ſtature, and of correſponding reſolution and vigour, accompanied with the ferocity of a barbarian deſpot. In the courſe, however, of a proſperous reign of above 40 years, he gave a new aſpect to the Ruſſian affairs: he annexed to his dominions ſeveral neighbouring principal duchies, ſubdued Novogorod, and reſcued his country from the Tartar yoke. He had no ſooner delivered Ruſſia from this dependence, than his alliance was courted by many European ſovereigns, and during his reign, for the firſt time, the emperor of Germany, the pope, the grand ſignior, the kings of Poland and Denmark, and the republic of Venice, felt it their intereſt to ſend ambaſſadors to the Ruſſian court. The talents of Ivan were not confined to military affairs. Ruſſia was indebted to him for the improvement of her commerce, and for opening a more ready communication with European nations. Under his auſpices, the knowledge of gunpowder, and the art of caſting cannon were firſt brought into Ruſſia by Ariſtotle of Bologna: he employed the ſame artiſt, and ſome other foreigners, to re-coin Ruſſian money, which had hitherto been disfigured by Tartar inſcriptions: he engaged, at a vaſt expence, Italian artiſts to encloſe the citadels of Moſcow and Novogorod, with walls of brick, and to erect ſeveral churches and other public ſtructures with the ſame materials. For his various ſervices he obtained the title of *Great*. It ſhould be obſerved, that the manners of Ivan were ſoftened and poliſhed in ſome degree by the example of his ſecond wife Sophia, a Grecian princeſs, daughter of Thomas Palæologus, a lady of conſummate beauty and winning addreſs, who, to all the ſofter graces of her ſex, added a vigorous and manly ſpirit, and who, while ſhe infuſed into her huſband a taſte for the arts of peace, animated him to thoſe glorious enterpriſes which occaſioned the aggrandiſement of his country. He is repreſented as being ſtern and unfeeling, given to ebriety, though he puniſhed it ſeverely in others, and an object of dread to all who approached him. He died in 1505, in the 67th year of his age, and the 43d of his reign. On each ſide of his remains were depoſited thoſe of his father, Vaſſili Vaſſilievitch, and of his ſon, Vaſſili Ivanovitch, who ſucceeded him on his throne, and expired in 1533. Coxe's Travels, vol. ii

Ivan II., Vassilievitch, ſucceeded his father Ivanovitch in the year 1530. Being only three years of age, he was left under the care and ſuperintendance of guardians, who faithfully performed the duty committed to them, and defeated the plots of the young prince's uncles, who were deſirous of depriving him of his crown. At the age of 19 he ſent a ſplendid embaſſy to the emperor Charles V. the chief purpoſe of which was to obtain from Germany proper perſons to aſſiſt him in the civilization of his ſubjects, and in introducing arts and manufactures. More than 300 artiſans, of all profeſſions, actually arrived at Lubec in their way to Moſcow, but were prevented from proceeding on their journey by the intrigues of the inhabitants of that town. Ivan II. raiſed the ſuperſtructure of the Ruſſian grandeur, of which his grandfather had laid the foundation. He inſtituted a ſtanding army, trained his ſoldiers to the uſe of fire-arms, and accuſtomed them to a more regular diſcipline. By means of this formidable body, he extended his dominions on all ſides, conquered the kingdoms of Kaſan and Aſtracan, and rendered the Ruſſian name reſpectable to the diſtant powers of Europe. He gave to his ſubjects the firſt code of written laws; he introduced printing into Ruſſia; he promoted commerce, and regulated all the duties connected with it. While involved in a war with the Poles, a domeſtic conſpiracy, in 1566, occaſioned by his tyranny, threatened to deprive him of his crown. Such was the danger, that he thought it beſt to make a feigned abdication. This produced the propoſed effect of awakening the dormant loyalty of the people; but as ſoon as he had reſumed the reins of government, he put to death the leaders of the conſpiracy, and ſecured himſelf againſt any future rebellion, by the inſtitution of a body of guards drawn from the remote provinces, and attached ſolely to himſelf. Theſe he augmented, till at length they proved ready inſtruments of deſpotiſm. He entered into a friendly intercourſe with queen Elizabeth of England, to whom he propoſed an alliance offenſive and defenſive. Though the queen did not agree to his propoſal in its full extent, yet a treaty was made, which was the commencement of the intercourſe which has ſince ſubſiſted between the two nations. In an invaſion of Ruſſia by the Poles, the city of Novogorod incurred the ſuſpicion of having, by its principal inhabitants, held a correſpondence with the king of Poland. This defection was puniſhed in the moſt barbarous manner by the czar, who, in the courſe of a few weeks, adjudged ſeveral thouſand perſons to death. In 1571, after Ruſſia had been deſolated by the plague, the Crim Tartars, inſtigated by the Poles, made an irruption into the ſouthern provinces, and advancing towards Moſcow, entirely defeated the Ruſſian army, which made a ſtand within 18 leagues of the capital. Ivan, upon the news, ſhut himſelf up in a fortified cloiſter, with his two ſons, and moſt valuable effects, and by this cowardly deſertion, allowed the Tartars to enter Moſcow, which they plundered and burnt, with a vaſt deſtruction of the inhabitants. The czar's moſt formidable enemy was Stephen Battori, king of Poland, who, with the king of Sweden, declared war againſt Ruſſia in 1579, took Narva and Riga, and became maſters of the whole of Livonia. The Ruſſians murmured at his conduct, and ſome of the nobles ventured to make remonſtrances againſt his ſuffering foreign enemies to ravage the country, and requeſted that he would permit his eldeſt ſon to appear at the head of the army. The czar, ſuſpecting that the prince had urged the nobles to this ſtep, reprimanded him in very ſevere terms; and he attempting to juſtify himſelf, the father's anger was rouſed to ſuch a pitch, that he gave him a violent blow with a ſtaff tipped with iron, which laid him at his feet, and which in four days proved fatal. The ſavage monarch, who did not probably intend his ſon's death, paſſed from the extreme of anger to that of ſorrow: he refuſed to take food or change his dreſs for ſeveral days, and endeavoured to expiate the deed by a magnificent funeral. An unſucceſsful attempt to chaſtiſe the Tartars, who had made a new incurſion into the Ruſſian territories, was the laſt act of this reign. He negociated with them and returned to Moſcow, when the approach of his own death awakened in him a deſire of conferring benefits on his people. He now endeavoured to correct abuſes introduced by his long wars, performed many acts of clemency, enjoined his ſucceſſor to liberate priſoners, repeal taxes, and redreſs the injuries which his brutality had inflicted. He expired in 1584, in the 54th year of his age. He has been reckoned among the great monarchs of his country, on account of his ſpirited and ſucceſsful attempts to free it from a foreign yoke, and to introduce arts and civilization. He left two ſons, of whom Feodor or Theodore ſucceeded him.

JUAN, GEORGE, in *Biography*. See the article DEGREE for an account of this naval commander, eminent for his mathematical knowledge and ſkill in practical aſtronomy.

JUAN, *St.* in *Geography*, one of the Cape Verde iſlands. See BRAVA.—Alſo, the capital of California. N. lat. 26° 25'. W. long. 114° 9'.—Alſo, a town of Mexico, in New Biſcay; 75 miles S.S.W. of Paral.—Alſo, a town of South America, in the province of Panama, between Panama and Porto-Bello.—Alſo, a ſea-port town of Mexico, in the province of Nicaragua; 30 miles S.E. of Leon. W. long. 87° 38'.—Alſo, a town in Eaſt Florida; 12 miles N. of St. Mark.—Alſo, a ſmall iſland in the North Pacific ocean, near the coaſt of New Albion, between the iſlands of St. Clemente and St. Diego.—Alſo, a town on the W. coaſt of the iſland of Luçon. N. lat. 17° 12'. E. long. 120° 48'.—Alſo, a town of South America, in the province of Moxes; 70 miles E N.E. of Trinidad. —Alſo, a town of Paraguay; 270 miles S.S.E. of Aſſumption.—Alſo, a river of New Mexico, which runs into the gulf of California, N. lat. 29° 10'.—Alſo, a river of Spaniſh North America, in the province of Nicaragua, which forms an outlet for the lake of Nicaragua to the gulf of Mexico. It has been propoſed to make uſe of this river in order to open a communication between the Atlantic and Pacific ocean. It is ſaid to be navigated by the Indians through its whole courſe, and was reported in the reign of Charles V. to be as conſiderable as the Guadalquivir at Seville. The length of the river St. Juan is by the lateſt Engliſh maps about 100 miles: and it is navigated by large flat-bottomed boats and canoes, laden with tallow and other effects, which they carry to Porto-Bello, at the diſtance of 80 leagues; but they are obliged to unload at three places, probably rapids, where canals would be required. At one of theſe, the caſtle of our lady, called by the Engliſh the fort St. Juan, is placed on a rock, and though ſmall, ſtrong enough to protect the entrance. It has 36 cannons and a battery; level with the water is a platform, and towards the land it is defended by a ditch and rampart, reaching to the river. The uſual garriſon is 100 men, beſides 16 of artillery, 40 muſqueteers, and 20 militia; which laſt manage the barks, two being placed every night up and down the river. There are 18 ſlaves, male and female, for the ſervice of the garriſon, which is ſupplied with proviſions, fleſh, fowls, garden ſtuff, maize, and other articles, from the city of Granada, at the diſtance of 60 leagues; and there are always proviſions for ſix months. But the climate is unhealthy, as it rains almoſt perpetually, and a recruit of 50 men from the capital, Guatimala, is neceſſary to ſupply the places of thoſe who die. This fortreſs is regarded as the key of New Spain and Peru; and by ſeizing it, and the port of Realejo, an enemy would become maſter of both oceans. Such is the account of Alcedo, cited by Pinkerton in the 3d volume of his Geography, to which we refer for ſome further particulars relating to the projected paſſage by the lake of Nicaragua between the two fore-mentioned oceans..—Alſo, a town of South America, in the Audience of Quito; 15 miles N.W. of St. Joachim de Omaguas.—Alſo, a river of Popayan, which runs into the Pacific ocean, N. lat. 3° 32′.

Juan *Battiſta, St.*, a town of South America, in the province of Chiquitos; 250 miles E.S.E. of Santa Cruz de la Sierra la Nueva.—Alſo, an iſland in the Pacific ocean, diſcovered by Quiros in 1606. S. lat. 26°. W. long. 149°.

Juan *de Buenaviſta*, a town of the iſland of Cuba, on the N. coaſt. N. lat. 22° 2′. W. long. 77° 57′.

Juan *Capiſtrano, St.*, a Spaniſh ſettlement and miſſion in New Albion, formed in 1776; ſituated in a ſmall cove on the Pacific ocean.

Juan *de Cinaloa, St.* See Cinaloa.

Juan *de Dios, St.*, a town of New Navarre; 240 miles W. of Caſa Grande.

Juan *Fernandes.* See Fernandes.

Juan *de la Frontera*, or *de la Cordillera*, a town of Chili; 120 miles N.N.E. of St. Yago. In its neighbourhood are gold mines. S. lat. 33° 25′. W. long. 68° 55′.—Alſo, a diſtrict of South America, lying to the eaſt of the Andes, with a town of the ſame name; called alſo Chacapoyas.—Alſo, a town of Peru, and capital of a juriſdiction in the dioceſe of Truxillo. S. lat. 6° 12. W. long. 77° 28′.

Juan *de Fuca, Straits of*, a large bay or gulf of the North Pacific ocean, on the W. coaſt of North America. In 1792 captain Vancouver gave it the name of the gulf of *Georgia*, which ſee. Its entrance lies in N. lat. 48° 25′. W. long. 122° 55′.

Juan *de Goava, St.*, a town of the iſland of Hiſpaniola; 80 miles N.W. of St. Domingo.

Juan *de Nova*, two ſmall iſlands in the Indian ſea. S. lat. 10° 20′. E. long. 52° 45′.

Juan *de los Llanos, St.*, or *San*, a province of South America, in New Granada, which forms a conſiderable diſtrict, if it be extended as far as the Orinoco; but as the capital town is on the weſtern ſkirts, the extenſion given by La Cruz ſeems very arbitrary, there being no Spaniſh ſettlement in that direction. This territory conſiſts of prodigious plains, extending for 2 or 300 leagues. The town was founded in 1555, and was formerly celebrated for gold mines, which have now declined; and the inhabitants ſcarcely exceed 50; 50 miles E.S.E. of Santa Fé de Bogota. N. lat. 3°. W. long. 73° 26′.

Juan *del Oro, St.*, or *Caravaya*, a town of Peru, and capital of a juriſdiction, in the viceroyalty of Buenos Ayres, and dioceſe of Cuſco; 150 miles S.E. of Cuſco. N. lat. 14° 40.′ W. long. 69° 36′.

Juan *de Paſto, St.* See Pasto.

Juan *de Porto Rico, St.*, a town and capital of the iſland of Porto Rico, ſituated on a peninſula in the N. coaſt of the iſland, having a good harbour, defended by a citadel and caſtle; populous and well built, the ſee of a biſhop and reſidence of the governor. The town was founded in the year 1514; but in 1594, when it was in a flouriſhing ſtate, it was attacked by ſir Francis Drake, who deſtroyed all the ſhips in the harbour, but could proceed no farther. In 1597 it was taken and plundered by the earl of Cumberland. N. lat. 18° 30′. W. long. 66° 20′.

Juan *del Rey, St.*, a town of Mexico, in the province of Guaxaca; 25 miles N. of Guaxaca.

Juan *Rio*, a town of the iſland of Cuba; 26 miles E.S.E. of Spiritu Santo.

Juan *d'Ulua, St.*, a ſmall iſland in the gulf of Mexico, near the coaſt of Tlaſcala, at the mouth of the river Vera Cruz. On this little iſland is a fortreſs to defend the entrance into the harbour of Vera Cruz.

IVANGOROD, a town of Ruſſia, in the government of Peterſburg, on the Pliuſa, near the Baltic, oppoſite Narva, built by Ivan Baſilowitz; ſurrounded by a treble wall, and defended by a number of ſmall towers: 52 miles S.W. of Peterſburg. N lat. 59° 16′. E. long. 28° 14′.

IVANITS, a town of Croatia, on the river Lonia; 42 miles N.E. of Carlſtadt. N. lat. 46°. E. long. 16° 44′.

JUANNA. See Hinzuan.

IVAPECANGA, in *Botany*, a name given by ſome authors to the climbing plant, of which the ſarſaparilla, uſed in medicine, is the root.

JUAR, in *Geography*, a town of Hindooſtan, in the ſubah of Delhi; 17 miles S. of Secundara.

JUBA I., in *Biography*, king of Numidia, the ſon of Hiempſal, a deſcendant of Maſſiniſſa, favoured the cauſe of Pompey againſt Julius Cæſar. He defeated Curio, one of Cæſar's lieutenants, in Africa, who periſhed in the action; and after the battle of Pharſalia he united his forces to thoſe of Scipio. They were joined by Cato, who repreſſed the pride of Juba, by preventing him taking place above Scipio. He was conquered in a battle at Thapſus, and was totally abandoned by his ſubjects. Seeing that all was loſt, he killed himſelf, as did Petreius, who had ſhared his good fortune and his adverſity. His kingdom became a Roman province, of which Salluſt was the firſt governor.

Juba II. king of Mauritania, ſon of the preceding, being very young at the time of his father's death, was led as a captive in Cæſar's triumph. The conqueror requited him for this act of humiliation by affording him the advantages of an excellent education, in conſequence of which he became one of the moſt learned men of his time, and attained a conſpicuous place as an author, by which he attained to more glory than he could have derived from the inheritance of a kingdom. He gained the hearts of the Romans by the courteouſneſs of his manners, and Auguſtus rewarded his fidelity by giving him in marriage Cleopatra, the daughter of Antony, by conferring upon him the title of king, and making him maſter of all the territories which his father once poſſeſſed. Juba governed his dominions with a ſpirit of juſtice and lenity which gained him the eſteem of his ſubjects. He diſtinguiſhed himſelf as a writer by various learned works, which related to the hiſtory and antiquities of the Arabians, Aſſyrians, and Romans. He wrote alſo the hiſtory of theatres, of painting and painters, of the nature and properties of different animals, and a particular treatiſe on the virtues of the herb Euphorbia. He died about the year 24 of the Chriſtian era, leaving a ſon, Ptolemy, afterwards put to death by Caligula. Juba is quoted with great applauſe by Pliny, Strabo, Plutarch, Tacitus, and ſome other authors. His popularity, as a ſovereign, was ſo great, that the Mauritanians rewarded his benevolence by making him one of their gods. The Athenians raiſed him a ſtatue, and the Æthiopians did him homage as a deity. Univer. Hiſt. Suet.

Juba, in *Geography*, a town of Syria, on the right banks of the Euphrates, on a narrow ſlip of land, formed by the winding of the river; 90 miles W.N.W. of Bagdad. N. lat. 33° 42′. E. long. 41° 58′.

JUBAL, an iſland in the Red ſea, N. lat. 27° 30′. E. long. 33° 40′.

JUBBIL, a town of the Arabian Irak, on the Tigris; 50 miles S.E. of Al Modain.

JUBBRA, a town of Bengal; 45 miles W.N.W. of Ramgur. N. lat. 23° 58′. E long. 84° 58′.

JUBE, the *Ambo, Rood Loft*, or gallery over the choir ſcreen in our ancient churches, from which the leſſons in the matins and other church offices uſed to be read. It was ſo called from the readers or cantors aſking the benediction of the abbot, dean, or other ſuperior, before he began, in the following form: "Jube Domine benedicere."

JUBILEE, among the *Jews*, denotes every fiftieth year: being that following the revolution of ſeven weeks of years; at which time all the ſlaves were made free, and all lands reverted to their ancient owners. The jubilees were not regarded áfter the Babyloniſh captivity.

The word, according to ſome authors, comes from the Hebrew *jobel*, which ſignifies *fifty*: but this muſt be a miſtake, for the Hebrew יובל, *jobel*, does not ſignify fifty; neither do its letters, taken as cyphers, or according to their numerical power, make that number; being 10, 6, 2, and 30, that is, 48. Others ſay, that *jobel* ſignifies a *ram*, and that the jubilee was thus called becauſe proclaimed with a ram's horn, in memory of the ram that appeared to Abraham in the thicket. Maſius chooſes to derive the word from *Jubal*, the firſt inventor of muſical inſtruments, which, for that reaſon, were called by his name; whence the word *jobel* and *jubilee* came to ſignify the year of deliverance and remiſſion, becauſe proclaimed with the ſound of one of thoſe inſtruments, which at firſt was no more than the horn of a ram. Hottinger, with whom Dr. Patrick agrees, is of opinion, that *Jobel* is a word invented to imitate the ſound of the inſtrument; and that it does not ſignify the inſtrument itſelf, but the ſound which it made. Others derive *jobel* from יבל, *jabal*, in hiphil הביל, *hobil*, which ſignifies to recal or return; becauſe this year reſtored all ſlaves to their liberty, &c. The inſtitution of this feſtival is in Lev. xxv. 8. 17.

The learned are divided about the year of jubilee; ſome maintaining that it was every forty-ninth, and others that it was every fiftieth year. The ground of the former opinion is chiefly this, that the forty-ninth year, being of courſe a ſabbatical year, if the jubilee had been kept on the fiftieth, the land muſt have had two ſabbaths, or have lain fallow two years, which, without a miracle, would have produced a dearth. On the other hand it is alleged, that the ſcripture expreſsly declares for the fiftieth year, Lev. xxv. 10, 11. And beſides, if the jubilee and ſabbatical year had been the ſame, there would have been no need of a prohibition to ſow, reap, &c. becauſe this kind of labour was prohibited by the law of the ſabbatical year. (Lev. xxv. 4, 5.) The authors of the Univerſal Hiſtory, book i. chap. 7. note R, endeavour to reconcile theſe opinions, by obſerving, that as the jubilee began in the firſt month of the civil year, which was the ſeventh of the eccleſiaſtical, it might be ſaid to be either the forty-ninth or fiftieth, according as one or other of theſe computations was followed. The political deſign of the law of the jubilee, was to prevent the too great oppreſſion of the poor, as well as their being liable to perpetual ſlavery. By this means the rich were prevented from accumulating lands for perpetuity, and a kind of equality was preſerved through all the families of Iſrael, and the diſtinction of tribes was alſo preſerved, in reſpect both to their families and poſſeſſions, that they might be able, when there was occaſion, on the jubilee year, to prove their right to the inheritance of their anceſtors. Thus alſo it would be known with certainty of what tribe or family the Meſſiah ſprung. It ſerved alſo, like the Olympiads of the Greeks, and the Luſtra of the Romans, for the readier computation of time. The jubilee has alſo been ſuppoſed to be typical of the goſpel ſtate and diſpenſation, deſcribed by Iſaiah, lxi. ver. 1, 2. in reference to this period, as the "acceptable year of the Lord."

Some learned men have attempted to prove by a calculation, thought by others to be tolerably exact, that if the Jews had ſtill obſerved the jubilees, the fifteenth year of Tiberius, when John the Baptiſt firſt began to preach, would have been a jubilee, and conſequently the laſt; ſince fifty years after, the Jewiſh commonwealth was no longer in being. This particular is of ſome conſequence, if it be well founded, in our controverſy with the Jews, who pretend, that the ſon of David will come during the laſt jubilee. And this alſo exactly agrees with the deſign of the goſpel, already ſtated, which was to proclaim the grand jubilee, the ſpiritual freedom of the children of God foretold by the prophets Iſaiah and Zechariah, and prefigured by the jubilees of the Jews. Uſher places the firſt jubilee, after the promulgation of the law by Moſes, A. M. 2609, B. C. 1395; the ſecond A. M. 2658, B. C. 1346; the third A. M. 2707, B. C. 1297, &c. thus reckoning 49 years from jubilee to jubilee.

JUBILEE, in a *more modern ſenſe*, denotes a grand church ſolemnity, or ceremony, celebrated at Rome, wherein the pope grants a plenary indulgence to all ſinners; at leaſt to as many as viſit the churches of St. Peter and St. Paul at Rome.

The jubilee was firſt eſtabliſhed by Boniface VIII. in 1300, in favour of thoſe who ſhould go *ad limina apoſtolorum*; and it was only to return every hundred years. But the firſt celebration brought in ſuch ſtore of wealth to Rome, that the Germans called this the golden year; which occaſioned Clement VI. 1350, to reduce the period of the jubilee to fifty years. Urban VI. in 1389, appointed it to be held every thirty-five years, that being the age of our Saviour; and Paul II. and Sixtus IV. in 1475, brought it down to every twenty-five, that every perſon might have the benefit of it once in his life.

Boniface IX. granted the privilege of holding jubilees to ſeveral princes and monaſteries: for inſtance to the monks of Canterbury, who had a jubilee every fifty years; when people flocked from all parts to viſit the tomb of Thomas à Becket. Jubilees afterwards became more frequent, and the pope granted them as often as the church, or himſelf, had occaſion for them. There was uſually one at the inauguration of a new pope.

To be entitled to the privileges of the jubilee, the bull injoins faſtings, alms, and prayers. It gives the prieſts a full power to abſolve, in all caſes, even thoſe otherwiſe reſerved to the pope; to make commutations of vows, &c. in which it differs from a *plenary indulgence*. During the time of jubilee, all other indulgences are ſuſpended.

See an enumeration of the various writers, who have treated of the inſtitution of the Roman jubilee, in the "Bibliogr. Antiq." of Jo. Albert Fabricius; and the ſubject fully ſtated by the reverend Charles Chais, formerly miniſter of the French church at the Hague, in his "Lettres Hiſtoriques et Dogmatiques ſur les Jubilés et des Indulgences," publiſhed at the Hague in three vols. 8vo. 1751. Theſe letters contain the moſt full and accurate account that has ever been given of the inſtitution of the jubilee, and of the riſe, progreſs, abuſes, and enormities of the infamous traffic of indulgences. This account is judiciouſly collected from the beſt authors of antiquity, and from ſeveral curious records that have eſcaped the reſearches of other writers: it is alſo interſperſed with curious and ſometimes ludicrous anecdotes, that render the work amuſing as well as inſtructive. In the firſt volume of theſe letters the learned author lays open the nature and origin of the inſtitution of the jubilee; he proves it to have been a human invention, which owed its *riſe* to the avarice and ambition of the popes; and its *credit* to the ignorance and ſuperſtition of the people; the celebration of which was abſolutely unknown before the thirteenth century, which is the true date of its origin. He takes notice of the various changes which it underwent with reſpect to the time of its celebration, the various colours with which the ambitious pontiffs covered it, in order to render it reſpectable and alluring in the eyes of the multitude; and expoſes theſe illuſions by many convincing arguments, the gravity of which is ſeaſoned with an agreeable and temperate mixture of decent raillery. He proves, with indiſputable evidence, that the papal jubilee is an imitation of the "ſecular games" that were celebrated with ſuch pomp in pagan Rome. He points out the groſs contradictions that reign in the bulls of the different popes, with reſpect to the nature of this inſtitution and the time of its celebration. Nor does he paſs over in ſilence the infamous traffic of indulgences, the wordly pomp and ſplendour, the crimes, debaucheries, and diſorders of every kind, that were obſervable at the return of each jubilee year. He lays alſo before the reader an hiſtorical view of all the jubilees that were celebrated from the pontificate of Boniface VIII. in the year 1300 to that of Benedict XIV. in 1750, with an entertaining account of the moſt remarkable adventures that happened among the pilgrims who repaired to Rome on theſe occaſions.

One of our kings, *viz.* Edward III. cauſed his birth-day to be obſerved in manner of a jubilee, when he became fifty years of age, in 1362, but never before or after. This he did, by releaſing priſoners, pardoning all offences, except treaſon, making good laws, and granting many privileges to the people.

We have lately, *viz.* in 1809, had a jubilee, on occaſion of our ſovereign George III. having attained to the fiftieth year of his reign.

There are particular jubilees in certain cities, when ſeveral of their feaſts fall on the ſame day; at Puey en Velay, for inſtance, when the feaſt of the Annunciation happens on Good-Friday; and at Lyons, when the feaſt of St. John Baptiſt concurs with the feaſt of Corpus Chriſti.

In 1640, the Jeſuits celebrated a ſolemn jubilee at Rome; that being the centenary, or hundredth year from their inſtitution, and the ſame ceremony was obſerved in all their houſes throughout the world.

JUBILÆUS, or Jubileus, is uſed among the Romaniſts, to ſignify a religious who has been fifty years in a monaſtery, or an eccleſiaſtic who has been in orders fifty years.

Such veteran religious are diſpenſed with in ſome places from attending matins, or a ſtrict obſervance of any other of their rules.

Jubilæus is alſo extended to any man a hundred years old; and to a poſſeſſion or preſcription for fifty years, "Si ager non invenietur in ſcriptione, inquiratur de ſenioribus, quantum temporis fuit cum altero; & ſi ſub certo jubilæo manſit ſine vituperatione, maneat in æternum."

JUBO, in *Geography*, a kingdom of Africa, on the coaſt of Ajan, near the Eaſt Indian ſea, with a capital of the ſame name, ſubject to the Portugueſe. N. lat. 0 50'. E. long. 43° 20'.—Alſo, a river of Africa, which runs into the Indian ſea, a little to the N. of the equinoctial line, E. long. 42° 46'.—Alſo, a town of Africa, in the kingdom of Benin.

JUBONES, a river of Peru, which runs into the Pacific ocean, S. lat 3° 20'.

JUCARICHI, a town of Mexico, in the province of New Biſcay; 110 miles N.W. of Patral.

JUCASETZ, a town of Sclavonia; 25 miles S. of Eſzek.

JUCATAN. See Yucatan.

JUCCA, in *Botany*, the name of a diſtinct genus of plants, otherwiſe called *Yucca.*

JUCENDRO, in *Geography*, a town of the iſland of Madagaſcar. S. lat. 23° 10'. E. long. 47° 14'.

JUCKASJERVI, a town of Swediſh Lapland; 145 miles N.W. of Tornea. N. lat. 67° 50'. E. long. 20° 46'.

JUCKATAGHERI, a town of Hindooſtan, in the Carnatic; five miles E. of Muglee.

JUCKING, the notes of a cock partridge, inviting the hen to come to him. Theſe ſerve the ſportſmen in good ſtead for finding the places where they are.

JUCLEZ, in *Geography*, a town of Turkeſtan; 45 miles S.W. of Turkeſtan.

JUCURUTA, in *Ornithology*, a very beautiful ſpecies of owl, found in the Brazils, and variegated with black and yellow.

JUD, in *Mining*, is applied, in the collieries in Derbyſhire, to a certain depth of coal in the face of their work, which will fall at once, after the holers have undermined the ſame, and the hammer-men have applied their wedges near to the roof: it is alſo called the web, and the rib of coal in ſome places, and is limited, like the face of the coal, by parallel vertical ſlines or lengthway joints; the backs of Newcaſtle colliers.

JUDÆ Auricula. See Auricula.

JUDÆA. See Judea.

JUDAH, in *Scripture Biography*, the fourth ſon of Jacob and Leah, was born in Meſopotamia, A.M. 2249, B.C. 1755; and was always regarded as the chief of Jacob's children. The privileges of the firſt-born ſeem to have been transferred from Reuben to him, after the inceſt of Reuben with Bilhah his father's wife. For the bleſſing pronounced by Jacob on his death-bed to Judah, ſee Gen. xlix. 8—12. That part of it which occurs in the 10th verſe, ſeems to imply, that the regal power ſhould not go out of his family, and that the Meſſiah ſhould derive his birth from it.

Judah, Leo, in *Biography*, a learned Proteſtant divine, ſon of John Judah, a German prieſt, was born in the year 1482. When he was about twenty years of age, he was ſent to Baſil to purſue his academical ſtudies. Here he had for a fellow ſtudent, the afterwards much celebrated Zuingle, and from him, who had at a very early age been ſhocked at the ſuperſtitious practices of the church of Rome, he received ſuch impreſſions, and was directed to ſuch enquiries, as prediſpoſed him to embrace the reformed religion. Having obtained his degree of M.A. he was appointed miniſter of a Swiſs church, to the duties of which he applied himſelf with indefatigable zeal. His ſtudies led him to renounce the diſtinguiſhing tenets of popery, and an adoption of thoſe of the reformation. He openly preached in defence of the Proteſtant religion, was appointed by the magiſtrates and eccleſiaſtical aſſembly of Zurich paſtor of the church of St. Peter in that city, and became very celebrated as an advocate, as well from the preſs as the pulpit, of the ſyſtem to which he was a convert. At the deſire of his brethren, he undertook a tranſlation, from the Hebrew into Latin, of the whole Old Teſtament. The magnitude of the work, and the cloſeneſs with which he applied to it, were more than he was able to bear, and before he had completed it, he fell a ſacrifice to his labours in 1542, when he was about ſixty years of age. The tranſlation was finiſhed by other hands, and was printed at Zurich in 1543, and two years afterwards it was reprinted at Paris by Robert Stevens, accompanying the vulgate verſion, in adjoining columns, but without the name of the author of the new verſion. Judah was likewiſe the author of "Annotations"

tions" on divers books of the Old and New Teſtament, and of two catechiſms. Gen. Biog.

Judah, *Tribe of*, in *Scripture Geography*, a canton of Paleſtine, which extended S. of Benjamin, about 27 miles, quite to the mountains of Seir, or Edom, which were the frontiers between it and Idumæa. It was bounded on the E. by the Dead ſea, and on the W. by the tribes of Dan and Simeon, both which lay between it and the Mediterranean. Judah was reckoned the largeſt and moſt populous tribe of all the twelve, and the inhabitants were the ſtouteſt and moſt valiant. It was, moreover, the chief and royal tribe, from which the kingdom was denominated. The land was beautifully variegated with fertile plains, hills, dales, lakes, and fountains, and it produced great plenty of corn, wine, oil, fruits, and paſture, except where it lay contiguous to Idumæa. It was properly in this territory of Judah, that the Canaanites dwelt, and here Abraham and his deſcendants ſojourned, till they went down into Egypt. The moſt remarkable places of this tribe were Azekah, Bethlehem, Bethzor, Emmaus, Engedi, Hebron, Libna, Makkedah, Maon, Maſſada, Tekoah, and Ziph; which ſee reſpectively.

One of the principal prerogatives of this tribe was, that it preſerved the true religion, and the public exerciſe of the prieſthood, with the legal ceremonies in the temple of Jeruſalem; while the ten tribes gave themſelves up to idolatry, and the worſhip of the golden calves. This tribe, at the Exodus, was compoſed of 74,600 men, capable of bearing arms.

Judah, *Kingdom of*, a denomination given to the maimed kingdom of Rehoboam, in contradiſtinction to that of Iſrael, upon the revolt of the ten tribes. The crown paſſed from Benjamin (from Saul and Iſhboſheth) into Judah, which was David's tribe, and that of the kings his ſucceſſors, until the Babyloniſh captivity. And after the return from that captivity, although this tribe did not reign, it gave the ſceptre to thoſe who did reign, and in a certain ſenſe reunited in itſelf the whole Hebrew nation, which from that time was known only as "Judæi," Jews, deſcendants of Judah. See Jews and Israel.

JUDAICUS Lapis, a ſmall, grey, ſoft, brittle ſtone, in form of an olive, having lines drawn regularly on its ſurface, as if they were formed by art.

This is a kind of extraneous foſſil, being a ſpine of an echinus marinus petrified. This ſtone has by many been ſuppoſed to be a foſſil body in its native figure, but is really the remains of a ſpine of an echinus, filled with a plated ſpar. It is very common in Syria, and is ſometimes found with us. See Spar.

Theſe extraneous foſſils are the petrified ſpines of echini, aculei echinorum, or tecolithi of Pliny, which the chalk ſtrata, and thoſe of the Bath freeſtone in England, produce in great perfection and variety of ſhapes; ſome of them occaſioned by diſeaſe in the animal, as is probable, from the obſervations of Mr. Sowerby. It is not very common, that the ſpines are found attached to the foſſil echini: a ſpecimen of this kind, imbedded in a black flint, ſold for 20 guineas, we are told, at the ſale by auction of the late ſir Aſton Lever's muſeum. The foſſil ſpines of moſt of the echini differ ſo much from the recent ſpines, that Linnæus doubted whether they really were ſuch, a matter now placed beyond any doubt, by the diſcovery of ſpecimens like that above mentioned.

JUDAISM, the religious doctrines and rites of the Jews, which, as well as their commonwealth, (ſee Theocracy,) are attributed by Moſes wholly to God. Judaiſm was but a temporary diſpenſation, and was to give way, at leaſt the ceremonial part of it, at the coming of the Meſſiah. For a complete ſyſtem of Judaiſm, ſee the books of Moſes. Judaiſm was anciently divided into ſeveral ſects; the principal whereof were the *Phariſees*, *Sadducees*, and *Eſſenes*; which ſee reſpectively.

At preſent there are two ſects among the Jews, *viz.* the *Caraites*, (which ſee,) who admit of no rule of religion but the law written by Moſes; and the Rabbiniſts, who add to the law the traditions of the Talmud. See Rabbinists and Talmud.

It has been obſerved that Judaiſm, of all religions, is that which is the moſt rarely abjured. In the 18th of Edward I. the parliament granted the king a fifteenth for the expulſion of Judaiſm.

In England formerly, the Jews and all their goods belonged to the chief lord where they lived, and he had ſuch abſolute property in them, that he might ſell them; for they had not liberty to remove to another lord without leave. Mat. Paris tells us, that Henry III. ſold the Jews to earl Richard, his brother, for a term of years, that *quos rex excoriaverat, comes eviſceraret.*

They were diſtinguiſhed from the Chriſtians both living and dying; for they had proper judges and courts wherein their cauſes were tried, and they wore a badge on their breaſt over their clothes in ſhape of a table; and they were fined, if they ſtirred abroad without ſuch badges. They were never buried in the country, but always brought up to London, and interred without the walls.

JUDAN, in *Geography*, a town of Hindooſtan, in Baglana; 20 miles W. of Junere.

JUDAS Maccabæus. See Maccabees.

Judas-*tree*, in *Botany*. See Cercis.

JUDDA, in *Geography*, a town of Hindooſtan, in the circar of Gurrah; 10 miles E. of Mahur.

JUDE, or *the Epiſtle of Jude*, a canonical book of the New Teſtament, written againſt the heretics, who, by their impious doctrines and diſorderly lives, corrupted the faith and good morals of the Chriſtians.

The author of this epiſtle, called Judas, and alſo Thaddeus and Lebbeus, was one of the 12 apoſtles; he was the ſon of Alpheus, brother of James the Leſs, and one of thoſe who were called our Lord's brethren. We are not informed, when or how he was called to be an apoſtle; but it has been conjectured, that before his vocation to the apoſtleſhip he was an huſbandman, that he was married, and that he had children. The only account we have of him in particular, is that which occurs in John, xiv. 21, 22, 23. It is not unreaſonable to ſuppoſe, that, after having received, in common with the other apoſtles, extraordinary gifts at the pentecoſt, he preached the goſpel for ſome time in ſeveral parts of the land of Iſrael, and wrought miracles in the name of Chriſt. And, as his life ſeems to have been prolonged, it is probable that he afterwards left Judea, and went abroad preaching the goſpel to Jews and Gentiles in other countries. Some have ſaid that he preached in Arabia, Syria, Meſopotamia, and Perſia; and that he ſuffered martyrdom in the laſt-mentioned country. But we have no account of his travels upon which we can rely; and it may be queſtioned whether he was a martyr.

In the early ages of Chriſtianity, ſeveral rejected the Epiſtle of St. Jude, becauſe the apocryphal books of Enoch, and the aſcenſion of Moſes, are quoted in it. Nevertheleſs it is to be found in all the ancient catalogues of the ſacred writings; and Clement of Alexandria, Tertullian, and Origen, quote it as written by Jude, and reckon it among the books of ſacred ſcripture: in the time of Euſebius it was generally received. As to the objections that have been urged againſt its authority, Dr. Lardner ſuggeſts, that there is no neceſſity for ſuppoſing that St. Jude quoted a book called Enoch, or Enoch's prophecies; and even allowing that he did quote it, he gives it no authority; it was no canonical book of the Jews, and if ſuch a book exiſted among the Jews, it was apocryphal, and yet there might be in it ſome right things. Inſtead of referring to a book, called the "Aſſumption or Aſcenſion of Chriſt," which probably was a forgery much later than his time, it is much more credible, that St. Jude refers to the viſion in Zech. iii. 1—3. It has been the opinion of ſeveral writers, and among others of Hammond and Benſon, that St. Jude addreſſed his epiſtle to Jewiſh Chriſtians; but Dr. Lardner infers, from the words of the inſcription of the epiſtle v. 1, and v. 3, that it was deſigned for the uſe of all in general, who had embraced the Chriſtian religion. The laſt mentioned author ſuppoſes, that this epiſtle was written in the year of Chriſt 64, 65, or 66. Lardner's Works, vol. vi. See EPISTLE.

JUDEA, in *Ancient Geography*, a province of Aſia, more anciently called the *land of Canaan*, the *land of Promiſe*, the *Holy Land*, and *Paleſtine*; which ſee. It was called *Judea*, from Judah, whoſe tribe was the moſt conſiderable of the 12, and poſſeſſed the moſt fertile part of the whole. It did not aſſume the name of Judea, till after the return of the Jews from the Babyloniſh captivity, though it had been denominated, long before, the kingdom of Judah, in oppoſition to that of Iſrael. After their return, this tribe, which was the only one that made a figure, ſettled firſt at Jeruſalem, and in the adjacent territories, and then ſpread through the whole country, ſo that the name of Jehudah and Jehudim extended itſelf to all the reſt. (See JUDAH.) Judea was alſo called Syria, Palæſtina-Syria, Cœle-Syria, and Phœnicia. It was alſo called Idumæa, merely becauſe the Idumæans ſeized on ſome parts of it during the Babyloniſh captivity. The modern name, eſpecially among Chriſtians and Mahometans, is *Paleſtine*; which ſee.

Before the arrival of the Hebrews, Judea was governed by Canaanitiſh kings, each in his reſpective city. (See CANAAN.) When Joſhua conquered it, he governed it as the vicegerent of Jehovah, according to the form of the Jewiſh theocracy. The elders ſucceeded Joſhua, about 15 years; after which the Iſraelites fell into a kind of anarchy for ſeven or eight years. They were governed by Judges for about 317 years; then by kings from Saul to the Babyloniſh captivity about 507 years. After the captivity, Judah continued ſubject to the kings of Perſia, then to Alexander the Great, and his ſucceſſors; ſometimes to the kings of Syria, ſometimes to the kings of Egypt; paying, nevertheleſs, great deference, in matters of private government, to the high prieſt, and to princes of the family of David. From the time of the Maccabees, they continued in poſſeſſion of the ſovereign authority, till the reign of Herod the Great, about 135 years. See JEWS.

JUDENBACH, in *Geography*, a town of Germany, in the principality of Coburg; 12 miles N.E. of Coburg.

JUDENBURG, a town and capital of Upper Stiria, on the river Muehr, on a plain ſurrounded with lofty mountains, always covered with ſnow. It has a caſtle, college, and two convents. The French took it in 1797; 32 miles W.N.W. of Gratz. N. lat. 47° 10′. E. long. 14° 25′.

JUDGE, an officer appointed by the ſovereign powers of any country, to diſtribute that juſtice to their ſubjects which they cannot adminiſter in perſon.

The character of judge is part of the regal authority, whereof the king diveſts himſelf.

The chief function of judges is for the trial of cauſes both civil and criminal.

The Engliſh Judges are choſen out of the ſerjeants at law, and are conſtituted by letters patent. Their commiſſions are bounded with this limitation, "facturi quod ad juſtitiam pertinent ſecundum legem & conſuetudinem Angliæ:" and at their creation they take an oath, that they will indifferently miniſter juſtice to all them that ſhall have any ſuit or plea before them; and this they will not forbear to do, though the king by his letters, or by expreſs word of mouth, ſhould command the contrary; and they are anſwerable in body, land, and goods. 18 Ed. III. c. 1.

By the law of England all judges muſt derive their authority from the crown, by ſome commiſſion warranted by law. The judges of the king's bench, common pleas, and the barons of the exchequer, are all (excepting the chief juſtice of the king's bench, who is created by writ) appointed by patent. Formerly they held their places only during the king's pleaſure; but now, for the greater ſecurity of the liberty of the ſubject, by ſtatute 13 Will. III. c. 2. their commiſſions are to be *quamdiu ſe bene geſſerint*, and their ſalaries are aſcertained and eſtabliſhed; and by 1 Geo. III. cap. 23. they are to continue, notwithſtanding the demiſe of the crown; and their full ſalaries are abſolutely ſecured to them during the continuance of their commiſſions. Though upon an addreſs of both houſes of parliament they may be lawfully removed.

Judges muſt exerciſe their authority in a legal manner, and hold their courts in their proper perſons; for they cannot act by deputy, nor any way transfer their power to another, as the judges of eccleſiaſtical courts may. Yet when there are ſeveral judges in a court of record, the act of any one of them is effectual, provided their commiſſions do not require more: ſo likewiſe what is executed by a majority preſent, is the act of the court; but where they are equally divided in opinion, the cauſe is to be removed into the exchequer chamber, and for that purpoſe a rule is to be made, and the record certified, &c. Some things done by judges at their chambers are accounted as done by the court; and that they may be prepared to hear what is to come before them, they are to have a paper of the cauſes to be heard, ſent to them by the attornies the day before they are ſpoken to; that if, upon reading the record of any cauſe, any ſpecial matter that ariſes ſhould appear doubtful, they may ſatisfy themſelves by conſulting books.

The judges are bound by oath to determine according to the known laws and ancient cuſtoms of the realm. Their rule herein muſt be the judicial deciſions and reſolutions upon the various cauſes that have occurred, and not their own arbitrary will and pleaſure, or that of their prince.

Judges are free from all proſecutions for any thing done by them in court, which appears to have been an error of their judgment. But for wilful corruption, they have been complained of to the ſtar-chamber formerly, and may now be called to an account in parliament.

It has been ſaid, that ſcandalous reflections on the judges in Weſtminſter-hall are within the ſtatute of *ſcandalum magnatum*.

Thoſe who uſe threatening or reproachful words to a judge ſitting in the courts, are guilty of a high miſpriſion, and have been puniſhed with large fines, impriſonment, and corporal puniſhment. (Cro. Car 503.) Aſſaulting a judge, ſitting in the court, by drawing a weapon, without any blow ſtruck, is puniſhable with the loſs of the right hand, impriſonment for life, and forfeiture of goods and chattels, and of the profits of the perſon's lands during life (3 Inſt.

140.

140, 141.); and ſlaying the chancellor, treaſurer, or the king's juſtices of either bench, juſtices in eyre, or juſtices of aſſize, and all other juſtices aſſigned to hear and determine, being in their places doing their offices, is a ſpecies of treaſon by 25 Edw. III. c. 2. However, the barons of the exchequer, as ſuch, are not within the protection of this act. (1 Hal. P. C. 231.) Judges, who become ſolicitors in a cauſe which they are to judge, and privately and extrajudicially tamper with witneſſes, or labour jurors, may be dealt with according to the ſame capacity to which they baſely degrade themſelves. Bribery in judges is puniſhable by loſs of office, fine, and impriſonment; and by the common law, bribery of judges in relation to a cauſe depending before them, has been puniſhed as treaſon. If a judge ignorantly condemns a man to death for felony, when it is not felony; for this offence he ſhall be fined and impriſoned, and loſe his office. If a judge, who hath no juriſdiction of the cauſe, give judgment of death and award execution, which is executed, ſuch judge is guilty of felony; and alſo the officer who executes the ſentence. And if juſtices of the peace, on indictments of treſpaſs, arraign a man of felony, and judge him to death, and he is executed, it is felony in them. A judge ought not to judge in his own cauſe, nor in pleas where he is party.

It was formerly enacted, ſtat. 33 Hen. VIII. c. 24. that none ſhould be juſtices of aſſizes within the county where they were born, or do inhabit: but this is repealed by a late ſtatute, 12 Geo. II. c. 27.

It was formerly held, that by a juſtice's acceptance of any new name of dignity, his commiſſion was determined; but this was remedied by ſtatute 1 Edw. VI. c. 7. But it has been doubted, whether the dignity of baronet, created ſince that ſtatute, is within the equity of it.

Judges *of Hell.* See Hell and Tartarus.

Judge, *Itinerant.* See Itinerant.

Judge *Martial,* or *Advocate General,* the ſupreme judge in martial law as to the juriſdiction and powers of military courts. It is incumbent upon this perſon, as well as upon his deputies, to be well acquainted with the laws of the land, that they may admoniſh the court or preſident when their proceedings are tending to infringe the civil law. He is regiſter of courts-martial, and ſhould take down the evidence in the very words of the witneſs. He is neither a judge nor a juror as to the charge.

Judge, in *Scripture,* is applied to certain eminent perſons choſen by God himſelf to govern the Jews, from the time of Joſhua till the eſtabliſhment of the kings. For the nature and duration of their office, and the powers with which they were inveſted, ſee Jews.

The judges were not ordinary magiſtrates, but were appointed by God on extraordinary occaſions, as to head the armies, to deliver the people from their enemies, &c.—Salian has obſerved that they not only preſided in courts of juſtice, but were alſo at the head of the councils, the armies, and of every thing that concerned the government of the ſtate; though they never aſſumed the title either of princes, governors, or the like.

Salian remarks ſeven points wherein they differed from kings. 1. They were not hereditary. 2. They had no abſolute power of life and death, but only according to the laws, and dependently upon them. 3. They never undertook war at their own pleaſure, but only when they were commanded by God, or called to it by the people. 4. They exacted no tribute. 5. They did not ſucceed each other immediately, but after the death of one there was frequently an interval of ſeveral years before a ſucceſſor was appointed. 6. They did not uſe the enſigns of ſovereignty, the ſceptre or diadem. 7. They had no authority to make any laws, but were only to take care of the obſervance of the laws of Moſes.

Godwin, in his "Moſes and Aaron," compares them to the Roman dictators, who were appointed only on extraordinary emergencies, as in caſe of war abroad, or conſpiracies at home; and whoſe power, while they continued in office, was great, and even abſolute. Thus the Hebrew judges ſeem to have been appointed only in caſes of national trouble and danger. This was the caſe particularly with reſpect to Othniel, Ehud, and Gideon. The power of the judges, while in office, was very great; nor does it ſeem to have been limited to a certain time, like that of the Roman dictators, which continued for half a year: nevertheleſs it is reaſonable to ſuppoſe, that when they had performed the buſineſs for which they were appointed, they retired to a private life. This Godwin infers from Gideon's refuſing to take upon him the perpetual government of Iſrael, as being inconſiſtent with the theocracy.

Beſides theſe ſuperior judges, every city in the Hebrew commonwealth had its elders, who formed a court of judicature, with a power of determining leſſer matters in their reſpective diſtricts. The rabbies ſay, there were three ſuch elders or judges in each leſſer city, and twenty-three in greater. But Joſephus, whoſe authority has greater weight, ſpeaks of ſeven judges in each, without any ſuch diſtinction of greater and leſs. Sigonius (De Republ. Heb. l. vi. c. 6.) ſuppoſes that theſe elders and judges of cities were the original conſtitution ſettled in the wilderneſs by Moſes, upon the advice given him by Jethro (Exod. xxviii. 21, 22.); and continued by divine appointment after the ſettlement in the land of Canaan: whereas, others imagine that the Jethronian prefectures were a peculiar conſtitution, ſuited to their condition while encamped in the wilderneſs, but laid aſide after they came into Canaan. It is certain, however, that there was a court of judges and officers, appointed in every city, by the law of Moſes. (Deut. xvi. 18.) How far, and in what reſpects, theſe judges differed from the elders of the city, it is not eaſy to aſcertain; and whether they were the ſame or different perſons. Perhaps the title elders may denote their ſeniority and dignity; and that of judges, the office they ſuſtained. The lower courts of juſtice, in their ſeveral cities, were held in their gates. (Deut. xvi. 16.) See Gate. Each tribe had its reſpective prince, whoſe office related chiefly, if not altogether, to military affairs. We read alſo of the princes of the congregation, who preſided in judiciary matters. Theſe are called elders, and were ſeventy in number. (Numb. xi. 16, 17. 24, 25.) But it does not appear whether or not this conſiſtory of ſeventy elders was a perpetual, or only a temporary inſtitution. Some have ſuppoſed that it was the ſame that afterwards became famous under the appellation of Sanhedrim; but others conceive the inſtitution of the ſeventy elders to have been only temporary, for the aſſiſtance of Moſes in the government, before the ſettlement in the land of Canaan; and that the Sanhedrim was firſt ſet up in the time of the Maccabees. See Sanhedrim.

Judge, in *Mining,* is applied, in the coal-pits of Nottinghamſhire and Derbyſhire, to a piece of board cut to a wedge-like ſhape, which ſhould fit exactly into any part of the excavation made under the face or bank of the coals, by the holers, in order to looſen them. The length of the judge is regulated by the depth or width of the jud, or web of coal which will fall at once: and the overlooker is required daily to try the judge in the holing, to ſee that the holers undermine ſufficiently far back; and yet, in order to ſave themſelves trouble, do not make the hole higher than the judge, and thereby cut away and waſte the jud of coal. Theſe proceſſes of coal-digging are particularly deſcribed in Mr. Farey's Report, vol. i. p. 344.

Judges, or *Book of Judges,* is a canonical book of the Old Teſtament, containing the hiſtory of the Iſraelite judges, of whom we have been ſpeaking in a preceding article.

The author is not known: it is probable the work did not come from any ſingle hand, being rather a collection of ſeveral little hiſtories, which at firſt were ſeparate, but were afterwards collected by Ezra, or Samuel, into a ſingle volume; and, in all likelihood, were taken from the ancient journals, annals, or memoirs, compoſed by the ſeveral judges.

The antiquity of this book is unqueſtionable, as it muſt have been written before the time of David; ſince the deſcription (chap. i. v. 21.) was no longer true of Jeruſalem, after he had taken poſſeſſion of it, and had introduced a third claſs of inhabitants of the tribe of Judah. Eichorn acknowledges, that it doth not bear any marks of ſubſequent interpolation. Dr. Patrick is of opinion that the five laſt chapters are a diſtinct hiſtory, in which the author gives an account of ſeveral memorable tranſactions, which occurred in or about the time of the judges; whoſe hiſtory he would not interrupt by intermixing theſe matters with it, and therefore reſerved them to be related by themſelves, in the ſecond part, or appendix. In theſe he firſt gives an account how idolatry crept into the tribe of Ephraim, then how it was propagated among the Danites; after which he relates a moſt heinous act of adultery, committed in the tribe of Benjamin; which introduces the hiſtory, firſt, of the almoſt total deſtruction of that tribe for their countenancing that deteſtable fact, and then of its reſtoration. Eichorn alſo ſuppoſes that theſe chapters are diſtinct fragments of a leſs certain date, but poſterior to David (chap. xviii. v. 31.), under whom the houſe of God ceaſed to be in Shiloh.

JUDGMENT, or the ſecond operation of the mind in the acquiſition of knowledge (the firſt being perception), is a faculty of the ſoul, by which it perceives the relation between two, or more, ideas: or the concurrence or coincidence of two ideas, or the want of concurrence or coincidence. Two ideas, being compared together, concur, as in the inſtance of milk and whiteneſs; and they coincide, as in thoſe of God and Creator; or they do not concur, as vice and uſefulneſs, or they do not coincide, as man and brute.

Thus, when we judge, that the ſun is greater than the moon, the underſtanding firſt compares the two ideas of the ſun and the moon; and, finding the idea of the ſun greater than that of the moon, the will perfectly acquieſces in that perception, nor puts the mind upon any farther enquiry.

It is not the underſtanding, then, that judges, as is ordinarily thought; judgments and reaſonings on the part of the underſtanding, are but mere perceptions; it is the will alone that judges, by acquieſcing in what is repreſented to it by the underſtanding.

The only difference, then, between *perception*, *judgment*, and *reaſoning*, ſo far as the underſtanding is concerned in them, is this; that it perceives a thing ſimply, without any relation to any other thing, in a ſimple perception; that it perceives the relations between two or more things in judgments; and, laſtly, that it perceives the relations that are between the relations of things in reaſonings; ſo that all the operations of the underſtanding are in effect no more than pure perceptions.

Thus, when we perceive, for inſtance, twice 2, or 4, this is no more than a ſimple perception; when we judge, that twice 2 are 4, or that twice 2 are not 5, the underſtanding does no more than barely perceive the relation of equality that is between twice 2 and 4, or of inequality between twice 2 and 5. Farther, reaſoning conſiſts in perceiving the relation, not between two or more things, for that would be a judgment, but of two or more relations of two or more things: thus, when I conclude, that 4 being leſs than 6, twice 2 being 4, are by conſequence leſs than ſix; I perceive not only the relation of inequality between 2 and 4, and 6 (for this were only a judgment), but alſo the relation of inequality between the relation of twice 2 and 4, and the relation between 4 and 6; which conſtitutes a reaſoning. The underſtanding, therefore, only perceives, and it is the will that judges and reaſons, in aſſenting voluntarily to what the underſtanding repreſents.

Indeed, when the things which we conſider appear clear and perfectly evident, it ſeems as if it were not voluntarily, that the mind conſents to them; whence we are led to think, that it is not properly the will, but the underſtanding that judges of them. But to clear this point it muſt be obſerved, that the things which we conſider, never appear entirely evident, till the underſtanding has examined them on all ſides, and has perceived all the relations neceſſary to judge of them; whence it happens, that the will, not being able to will any thing without knowledge, cannot act on the underſtanding; that is, cannot deſire it to repreſent any thing new in its object, as having already viewed it on all ſides that have any relation to the queſtion in hand. It is obliged then to reſt in what has been already repreſented, and to ceaſe to agitate and diſturb it any farther; in which ceſſation it is that judgment conſiſts.

This reſt or judgment, then, not being free when things are in their laſt evidence, we are apt to imagine, that it is not the effect of the will. So long as there is any thing obſcure in the ſubject that we conſider, or that we are not fully ſatisfied that we have diſcovered every thing neceſſary to reſolve the queſtion, as it happens in moſt of thoſe things that are difficult, and that contain various relations; we remain at liberty not to acquieſce: the will may command the underſtanding to purſue its enquiries farther, and to make new diſcoveries, whence it is, that we are more ready to allow the judgments formed on theſe ſubjects to be voluntary.

Moſt philoſophers, however, maintain, that even the judgments which we form on obſcure things are not voluntary; and will have our conſenting to the truth to be an action of the underſtanding, which they call *aſſent,* to diſtinguiſh it from our conſenting to goodneſs, which they attribute to the will, and call it *conſent*.

But their error is owing to this, that in our preſent ſtate we frequently ſee things to be evidently true, without the leaſt reaſon to doubt of them; in which caſe the will is not at liberty either to give or refuſe her aſſent: but it is not ſo in matters of goodneſs; there being nothing, which we do not know ſome reaſon for forbearing to love. So that we here perceive a manifeſt indifference, and are fully convinced, that when we love any thing, even God, for inſtance, we uſe our liberty, and do it voluntarily. But the uſe we make of our liberty is not ſo apparent, when we conſent to the truth, eſpecially when it appears perfectly evident: and this leads us to think, that our conſent to truth, that is, our judgment, is not voluntary; as if an action, to be voluntary, muſt be indifferent; as if the bleſſed above did not love God voluntarily,

tarily, becauſe they cannot be diverted from it by any other thing; nor we conſent freely to this evident propoſition, that twice 2 are 4, becauſe we have no appearance of reaſon to diſſuade us from it.

Mr. Locke (b. iv. c. 14.) diſtinguiſhes between knowledge and judgment; the former being that faculty of the mind, by which it certainly perceives, and is undoubtedly ſatisfied of the agreement or diſagreement of any ideas; the latter, or judgment, is the putting of ideas together, or the ſeparating of them from one another in the mind, when their certain agreement or diſagreement is not perceived, but preſumed to be ſo; which is, as the word imports, taken to be ſo before it certainly appears; and if it ſo unites or ſeparates them, as in reality things are, it is right judgment. A judgment, called by Mr. Locke a mental propoſition, is that union or ſeparation of the ideas which is the reſult of the act of judging; and this may exiſt without any connection with words; though, as men are very much uſed to connect ideas with words, it is very difficult to treat of judgments as diſtinguiſhed from verbal propoſitions. (See PROPOSITION.) The ſources of judgment are conſciouſneſs, ſenſe, intuition, and teſtimony. See each of theſe articles reſpectively. The definition commonly given of judgment, by the more ancient writers in logic, was, that it is an act of the mind, by which one thing is affirmed or denied of another. Dr. Reid thinks this to be as good a definition as can be given, and prefers it to ſome others; but it is evidently liable to objections, which he has ſtated. Judgment is a ſolitary act of the mind, and the expreſſion of it by affirmation or denial is not at all eſſential to it; and therefore the definition muſt be reſtricted to mental affirmation or denial, which, as he ſays, is only another name for judgment. Beſides, affirmation or denial is very often the expreſſion of teſtimony, which is a different act of the mind, and ought to be diſtinguiſhed from judgment. Judgment, as Dr. Reid proceeds to obſerve, is an act of the mind ſpecifically different from ſimple apprehenſion, or the bare conception of a thing; for although there can be no judgment without a conception of the things about which we judge, yet conception may be without any judgment. Judgment can be expreſſed by a propoſition only, and a propoſition is a complete ſentence; but ſimple apprehenſion may be expreſſed by a word or words, which make no complete ſentence. It is ſelf-evident, that every judgment muſt be either true or falſe; but ſimple apprehenſion or conception can neither be true nor falſe. Again, one judgment may be contradictory to another; and it is impoſſible for a man to have two judgments at the ſame time, which he perceives to be contradictory. But contradictory propoſitions may be conceived at the ſame time without any difficulty. Dr. Reid obſerves, that there are ſome notions or ideas that ought to be referred to the faculty of judgment as their ſource; becauſe if we had not that faculty, they would not enter into our minds; *e.g.* we could not have the idea of any relation without ſome exerciſe of judgment, and yet the relations of things conſtitute one great claſs of our notions or ideas. It is further remarked, that in perſons come to years of underſtanding, judgment neceſſarily accompanies all ſenſations, perception by the ſenſes, conſciouſneſs and memory, but not conception. The man who feels pain, judges and believes that he is really pained; a perſon who perceives an object believes that it exiſts, and is what he diſtinctly perceives it to be; nor is it in his power to avoid ſuch judgment; and the ſame may be ſaid of memory and conſciouſneſs. All operations of this kind are accompanied with a determination that ſomething is true or falſe, and a conſequent belief. If this determination be not judgment, it is an operation without a name; for it is not ſimple apprehenſion, neither is it reaſoning; it is a mental affirmation or negation; it may be expreſſed by a propoſition affirmative or negative, and it is accompanied with the firmeſt belief. "Theſe," ſays Dr. Reid, "are the characteriſtics of judgment, and I muſt call it judgment, till I can find another name for it." The judgments we form are either of things neceſſary, or of things contingent. Our aſſent to neceſſary propoſitions is not grounded upon any operation of ſenſe, of memory, or conſciouſneſs, nor does it require their concurrence; it is unaccompanied by any other operation but that of conception, which muſt accompany all judgment; and therefore this judgment of things neceſſary may be called pure judgment. Our judgment of things contingent muſt always reſt upon ſome other operation of the mind, ſuch as ſenſe or memory, or conſciouſneſs, or credit in teſtimony.

In common language, there are many forms of ſpeech which ſhew that the ſenſes, memory, and conſciouſneſs, are conſidered as judging faculties. Evidence is the ground of judgment, and when evidence is perceived, it is impoſſible not to judge. Dr. Reid, adverting to the notion of judgment, which, he thinks, is peculiar to Mr. Locke, and which we have already ſtated, expreſſes his opinion, that there can be no knowledge without judgment, though there may be judgment without that certainty which we commonly call knowledge. In order to avoid diſputes about the meaning of words, this author wiſhes to be underſtood as giving the name of judgment to every determination of the mind concerning what is true or what is falſe. This, he thinks, is what logicians, from the days of Ariſtotle, have called judgment. "Whether it be called one faculty," he ſays, "as I think it always has been, or whether a philoſopher chuſes to ſplit it into two, ſeems not very material. And if it be granted, that by our ſenſes, our memory and conſciouſneſs, we not only have ideas or ſimple apprehenſions, but form determinations concerning what is true and what is falſe; whether theſe determinations ought to be called *knowledge* or *judgment*, is of ſmall moment."—"Philoſophers," ſays the ſame writer, "have never been able to give any definition of judgment which does not apply to the determination of our ſenſes, our memory, and conſciouſneſs, nor any definition of ſimple apprehenſion which can comprehend thoſe determinations." Judgments of this kind may, in the ſtricteſt ſenſe, be called "judgments of nature," nor do they admit of improvement by culture.

Dr. Reid further obſerves, that ſome exerciſe of judgment is neceſſary in the formation of all abſtract and general conceptions, whether they be more ſimple or more complex; in dividing, in defining, and, in general, in forming all clear and diſtinct conceptions of things, which are the only fit materials of reaſoning. He adds, that all our notions of relations may more properly be aſcribed to judgment as their ſource and origin, than to any other power of the mind. The notions of unity and number are ſo abſtract, that it is impoſſible they ſhould enter into the mind until it has ſome degree of judgment. Judgment is alſo an ingredient in all matters of taſte; in all moral determinations; and in many of our paſſions and affections. So that this operation, after we come to have any exerciſe of judgment, mixes with moſt of the operations of our minds, and, in analyſing them, cannot be overlooked without confuſion and error. Reid's Eſſays, eſſ. vi. chap. 1.

JUDGMENT, in a *Legal Senſe*, is a ſentence or deciſion pronounced by authority of a king, or other power, either by their own mouth, or by that of their judges, and officers, whom they appoint to adminiſter juſtice in their ſtead.

Judgments are the ſentence of the law, pronounced by the court upon the matter contained in the record; and they are of four ſorts. 1ſt. Where the facts are confeſſed by the parties, and the law determined by the court; as in caſe of judgment upon *demurrer*. (See DEMURRER.) 2dly. Where the law is admitted by the parties, and the facts diſputed; as in caſe of judgment upon a *verdict*. (See VERDICT.) 3dly. Where both the fact and the law ariſing thereon are admitted by the defendant; which is the caſe of judgments by *confeſſion* or *default*. (See thoſe articles.) 4thly. Where the plaintiff is convinced that either fact, or law, or both, are inſufficient to ſupport his action, and therefore abandons or withdraws his proſecution; which is the caſe in judgments upon a *nonſuit* or *retraxit*; which ſee.

The judgment, though pronounced or awarded by the judges, is not their determination or ſentence, but the determination and ſentence of *the law*; and, in ſhort, it is the remedy preſcribed by law for the redreſs of injuries; and the ſuit or action is the vehicle or means of adminiſtering it. What that remedy may be, is, indeed, the reſult of deliberation and ſtudy to point out; and therefore the ſtile of the judgment is, not that it is decreed or reſolved by the court, for then the judgment might appear to be their own; but "it is conſidered," *conſideratum eſt per curiam*, that the plaintiff do recover his damages, his debt, his poſſeſſion, and the like; which implies, that the judgment is none of their own; but the act of law, pronounced and declared by the court, after due deliberation and enquiry. All theſe ſpecies of judgments are either *interlocutory* or *final*. For the former, ſee INTERLOCUTORY. *Final* judgments are ſuch as at once put an end to the action, by declaring that the plaintiff has either entitled himſelf, or has not, to recover the remedy for which he ſues. In which caſe, if the judgment be for the plaintiff, it is alſo conſidered, that the defendant be either amerced, for his wilful delay of juſtice in not immediately obeying the king's writ by rendering the plaintiff his due (8 Rep. 40. 61.); or be taken up, *capiatur*, till he pays a fine to the king for the public miſdemeanor, which is coupled with the private injury, in all caſes of force (8 Rep. 59. 11 Rep. 43. 5 Mod. 285.), of falſhood in denying his own deed, (F. N. B. 121. Co. Litt. 131. 8 Rep. 60. 1 Roll. Abr. 219. Lill. Entr. 379. C. B. *Hil.* 4 Ann. Rot. 430.) or unjuſtly claiming property in replevin, or of contempt by diſobeying the command of the king's writ or the expreſs prohibition of any ſtatute. (8 Rep. 60.) But now, in caſe of treſpaſs, ejectment, aſſault, and falſe impriſonment, it is provided by the ſtatute 5 & 6 W. & M. c. 12., that no writ of *capias* ſhall iſſue for this fine, nor any fine be paid; but the plaintiff ſhall pay 6*s*. 8*d*. to the proper officer, and be allowed it againſt the defendant among his other coſts. And therefore upon ſuch judgments, in the common pleas, they uſed to enter that the fine was remitted, and now in both courts they take no notice of any fine or *capias* at all. (Salk. 54. Carth. 390.) But if judgment be for the defendant, then in caſe of fraud and deceit to the court, or malicious or vexatious ſuits, the plaintiff may alſo be fined (8 Rep. 59, 60.); but in moſt caſes it is only conſidered, that he and his pledges of proſecuting be (nominally) amerced for his falſe claim, *pro falſo clamore ſuo*, and that the defendant may go thereof without a day, *eat inde ſine die*, that is, without any further continuance or adjournment; the king's writ, commanding his attendance, being now fully ſatisfied, and his innocence publicly cleared. To judgments coſts are a neceſſary appendage. See COSTS. Blackſt. Com. book iii.

In every judgment there ought to be three perſons, *actor*, *reus*, and *judex*; plaintiff or proſecutor, defendant, and judge.

Judgment may be given not only upon the trial of the iſſue, but on a default, confeſſion, demurrer, or an outlawry, which is a judgment in itſelf. After iſſue joined in a cauſe, the plaintiff may, if he thinks proper, accept of a judgment from the defendant; but on ſuch a judgment, a writ of error may be had without putting in bail, which cannot be done on a judgment after verdict. All judgments given in courts of record muſt be entered; in order to which the plaintiff's attorney, four days after the record is brought into court, may, if the judgment is out, enter judgment by the uſual courſe of the court; but he cannot do this ſooner, becauſe the defendant muſt have time to bring in a writ of error, or to find out matter for an arreſt of judgment. The defendant may oblige the plaintiff to enter his judgment, in order that he may plead it to any other action; and judgment upon a demurrer to a declaration, &c. which does not paſs upon the merits of the cauſe, is no bar to it, though other judgments may be pleaded in bar to any action brought again for the ſame thing. Judgments are to continue till they are reverſed; but an action of debt will lie on a good judgment, as well after a writ of error is brought, as before it. If a plaintiff does not take out an execution within a year and a day after judgment is obtained, the judgment muſt be revived by a *ſcire facias*.

JUDGMENT *for Crimes*, ſucceeds trial and conviction, in ſuch crimes and miſdemeanors as are either too high, or too low, to be included within the benefit of clergy. For when, upon a capital charge, the jury have brought in their verdict guilty, in the preſence of the priſoner; he is either immediately, or at a convenient time ſoon after, aſked by the court, if he has any thing to offer, why judgment ſhould not be awarded againſt him. And in caſe the defendant be found guilty of a miſdemeanor, (the trial of which may, and does uſually, happen in his abſence, after he has once appeared,) a *capias* is awarded and iſſued, to bring him in to receive his judgment; and, if he abſconds, he may be proſecuted even to outlawry. (See ARREST *of Judgment*.) When all reſources fail, the court muſt pronounce that judgment, which the law hath annexed to the crime. Judgment, in caſe of treaſon or felony, muſt be by an expreſs ſentence, an outlawry, or abjuration; and no judgment can be inflicted contrary to law, or that is not appointed by act of parliament. Theſe judgments are of very different kinds, ſome are capital, extending to the life of the offender, and conſiſting generally in being hanged by the neck till dead; though in very atrocious crimes other circumſtances of terror, pain, or diſgrace, are ſuperadded; as in treaſons of all kinds, the offender is ſentenced to be drawn or dragged to the place of execution; in high treaſon affecting the king's perſon or government, embowelling alive, beheading, and quartering; and in murder, a public diſſection. In caſe of any treaſon committed by a female, the judgment is to be burned alive. But the humanity of the Engliſh nation has authorized, by a tacit conſent, an almoſt general mitigation of ſuch part of theſe judgments as favour of torture or cruelty; a ſledge or hurdle being uſually allowed to ſuch traitors as are condemned to be drawn; and there being few inſtances (and thoſe accidental or by negligence) of any perſon's being embowelled or burned, till previouſly deprived of ſenſation by ſtrangling. (See EXECUTION *of Criminals*.) Some puniſhments conſiſt in exile or baniſhment, by abjuration of the realm, or tranſportation; others in loſs of liberty, by perpetual or temporary impriſonment. Some extend to confiſcation, by forfeiture of lands, or moveables, or both, or of the profits of land for life; others induce a diſability of holding offices or employments, being heirs, executors, and the like. Some, though rarely, occaſion a mutilation, or diſmembering, by cutting off the hand, or ears; others fix a laſting ſtigma on the offender, by ſlitting the noſtrils; or branding in the hand or cheek. Some are merely pecuniary, by ſtated, or diſcretionary fines; and laſtly there are others, that conſiſt principally in their ignominy, though moſt of them are mixed with ſome degree of corporal pain; and theſe are inflicted chiefly for ſuch crimes, as either ariſe from indigence, or render even opulence diſgraceful. Such are whipping, hard labour in the houſe of correction or otherwiſe, the pillory, the ſtocks, and the ducking ſtool. Blackſt. Com. book iv.

JUDGMENTS *for Debts* are acknowledged by a perſon's giving a general warrant of attorney to any attorney of the court in which it is to be acknowledged, to appear for him at the ſuit of the party to whom the ſame is to be done, and to file common bail, receive a declaration, and then to plead, *non ſum informatus,* I am not informed; or to let it paſs by *nihil dicit,* he ſays nothing; upon which judgment is entered for want of a plea. Judges that ſign judgment of lands, are to ſet down the day of the month and year in which they do it; and they ſhall be good againſt purchaſers only from ſuch ſigning. Where a perſon has acknowledged a judgment for the ſecurity of money, and afterwards, on borrowing more money of another perſon, mortgages his lands, &c. without giving any notice of the judgment to the mortgagee; in ſuch caſe, if the mortgager do not within ſix months pay off and diſcharge the judgment, he ſhall forfeit his equity of redemption, 4 and 5 Will. and Mary. Acknowledging a judgment in the name of another perſon, without his privity or conſent, is made felony by 21 Jac. I. c. 26.

JUDGMENT, *Action of Debt on,* lies for a perſon who hath once obtained a judgment againſt another for a certain ſum, and who has neglected to take out execution upon it; ſuch perſon, in his freſh action, ſhall not be put upon the proof of the original cauſe of action; but, after ſhewing the judgment once obtained, ſtill in full force, and yet unſatisfied, the law immediately implies, that by the original contract of ſociety the defendant hath contracted a debt, and is bound to pay it. This method ſeems to have been invented when real actions were more in uſe than at preſent, and damages were permitted to be recovered thereon; in order to have the benefit of a writ of *capias* to take the defendant's body in execution for theſe damages, which proceſs was allowable in an action of debt (in conſequence of the ſtatute 25 Edw. III. c. 17.), but not in actions real. Wherefore, ſince the diſuſe of theſe real actions, actions of debt upon judgment in perſonal ſuits have been partly much diſcountenanced by the courts, as being generally vexatious and oppreſſive, by haraſſing the defendant with the coſts of two actions inſtead of one. Blackſt. Com. b. iii.

JUDGMENT, *Aſſigning falſe.* See ASSIGN.

JUDGMENT *of God.* See JUDICIUM *Dei.*

JUDGMENT, *Execution of.* See EXECUTION, &c.

JUDGMENT, *Maſs of.* See MASS.

JUDGMENT, *Property by.* A judgment, in conſequence of ſome ſuit or action in a court of juſtice, is frequently the means of veſting the right and property of chattel intereſts in the prevailing party. In this caſe we muſt diſtinguiſh between property, the *right* of which is before veſted in the party, and of which only *poſſeſſion* is recovered by ſuit or action; and property, to which a man before had no determinate title or certain claim, but he gains as well the right as the poſſeſſion by the proceſs and judgment of the law. Of the former ſort are all debts and choſes in action; as if a man gives bond for 20*l.*, or agrees to buy a horſe at a ſtated ſum, or takes up goods of a tradeſman upon an implied contract to pay as much as they are reaſonably worth; in all theſe caſes the right accrues to the creditor, and is completely veſted in him at the time of the bond being ſealed, or the contract or agreement made; and the law only gives him a remedy to recover the poſſeſſion of that right, which already in juſtice belongs to him. But there is alſo a ſpecies of property, in which a man has not any claim or title whatſoever, till after ſuit commenced and judgment obtained in a court of law; where the right and the remedy do not follow each other, as in common caſes, but accrue at one and the ſame time; and where, before judgment had, no man can ſay that he has any abſolute property, either in poſſeſſion or in action. Of this nature are ſuch penalties as are given by particular ſtatutes, to be recovered on an action *popular*; or, in other words, to be recovered by him or them who will ſue for the ſame; in which caſe a ſuit and judgment at law are not only the means of recovering, but alſo of acquiring property. Another ſpecies of property, that is acquired and loſt by ſuit and judgment at law, is that of *damages* given to a man by a jury, as a compenſation and ſatisfaction for ſome injury ſuſtained; as for a battery, for impriſonment, for ſlander, or for treſpaſs. Here the plaintiff has no certain demand till after verdict; but when the jury has aſſeſſed his damages, and judgment is given thereupon, whether they amount to 20*l.* or 20*s.*, he inſtantly acquires, and the defendant loſes at the ſame time a right to that ſpecific ſum. To this kind of property may alſo be referred all title to coſts and expences of ſuit.

JUDGMENT, *Villainous.* See VILLAINOUS.

JUDICATURE, the quality or profeſſion of thoſe who adminiſter juſtice.

In which ſenſe judicature is a kind of prieſthood. In France, officers of judicature are venal.

JUDICATURE is alſo uſed to ſignify the extent of the juriſdiction of the judge, and the court wherein he ſits to render juſtice.

JUDICIUM *Crucis.* See *Judgment of the* CROSS.

JUDICIUM *Dei, Judgment of God,* was a term anciently applied to all extraordinary trials of ſecret crimes; as thoſe by arms and ſingle combat, and the ordeals; or thoſe by fire, or red-hot plough-ſhares; by plunging the arm in boiling water, or the whole body in cold water; in hopes God would work a miracle rather than ſuffer truth and innocence to periſh.

"Si ſuper defendere non poſſit, judicio Dei, ſcil. aqua vel ferro, fieret de eo juſtitia."

Theſe cuſtoms were a long time kept up, even among Chriſtians; and they are ſtill in uſe in ſome nations. See ORDEAL, WATER, COMBAT, DUEL, and CHAMPION.

Trials of this ſort were uſually held in churches, in preſence of the biſhops, prieſts, and ſecular judges; after three days faſting, confeſſion, communion, and many adjurations and ceremonies, deſcribed at large by Du Cange.

JUDICIUM *Parium* denotes a trial by a man's equals, *i. e.* of peers by peers, and of commoners by commoners. In magna charta it is more than once inſiſted on as the principal bulwark of our liberties, but eſpecially by chap. 29, that no freeman ſhall be hurt in either his perſon or property, "niſi per legale judicium parium ſuorum vel per legem terræ." And this was ever eſteemed, in all countries, a privilege of the higheſt and moſt beneficial nature.

JUDITH, an apocryphal book, excluded by the Jews from the canon of the Old Teſtament, and ſo called, becauſe Judith is the principal perſon to whoſe hiſtory the book refers. We ſhall firſt give a ſummary of the contents of this book, and then inquire into the time in which it was written, and ſtate different opinions concerning the writer of it. Nebuchodonoſor, king of the Aſſyrians, who reigned in Nineveh, having defeated Arphaxad, king of the Medes, and taken him priſoner, formed a deſign of extending his conqueſts, and for this purpoſe ſent Holofernes with a powerful army, who became maſter of Meſopotamia, Syria, Lybia, and Cilicia. After theſe conqueſts, he took poſſeſſion of Idumæa. Upon this the Iſraelites were alarmed, and taking poſſeſſion of the hilly country, fortified their cities. The high prieſt, Joachim, or Eliakim, encouraged their exertions, and ordered them to confide in God, and to implore his ſuccour. Holofernes expreſſed ſurpriſe at their vigorous preparations for reſiſtance againſt his powerful army, and enquired of their neighbours, the Moabites and Ammonites, what force they could command, and what was the reaſon of their declining to ſubmit to him. Achior, the chief of the Ammonites, informs him, that theſe people were ſometimes protected, and ſometimes forſaken by their God; adding, that if they had offended their God, he would deliver them into his hands; but if not, then God would defend them, and his whole army could not conquer them. Holofernes received this account with indignation, and ordered Achior to be carried to Bethulia, which he immediately beſieged, intending to revenge himſelf of Achior, as ſoon as he had taken that place. Onias, the governor of Bethulia, made preparations for its defence; but the inhabitants, dreading the event of a prolonged ſiege, wiſhed to ſurrender the place, and could ſcarcely be induced to continue their reſiſtance for five days. It was in theſe critical circumſtances, that Judith, ſaid to be of the tribe of Reuben, daughter of Merari, and widow of Manaſſeh, both opulent and beautiful, reſolved upon going into the camp of Holofernes, in order to deſtroy him. Accordingly ſhe left the city, and was introduced to Holofernes. The conqueror was captivated by the charms of her perſon, entertained her with a ſumptuous feaſt, and expecting to obtain a complete triumph over this beautiful and rich widow, indulged in drinking to exceſs. In the evening, Bagoas, the eunuch of Holofernes, who had introduced Judith, with her maid-ſervant, to the feaſt, ſhut up the chamber-doors and departed. Holofernes, overcome by the wine which he had drank, fell into a ſound ſleep. Judith availed herſelf of the opportunity, cut off the head of Holofernes with his own ſabre, depoſited it in her maid's bag, and taking advantage of the liberty that was allowed her to viſit and leave the camp at pleaſure, haſtened back to Bethulia. When the head of Holofernes was diſplayed to view on the walls of the city, the beſieging army of the Aſſyrians was ſeized with diſmay, and fled in great diſorder. The Iſraelites purſued them, killed many of them, and took poſſeſſion of a very large ſpoil. Judith took occaſion to ſing a hymn to the Lord, to whom ſhe conſecrated the arms of Holofernes, and accompanied the people to Jeruſalem to preſent their public thankſgiving for this ſignal deliverance. She returned afterwards to Bethulia, lived there to the advanced age of 105 years, and was buried with her huſband in this city. The people lamented her death for ſeven days; and the day on which this victory was obtained was reckoned by the Hebrews among their feſtivals.

The greateſt difficulty in this narration is to fix the time, when the event, which it records, happened. Some place it before, others after the captivity; and ſome finding inſuperable difficulties in reconciling it with the hiſtory of the Jews, Aſſyrians, and Medes, have maintained, that it is only a parable and allegory, and not a true hiſtory. The Greek and Syriac verſions ſeem to prove, that it occurred after the captivity of Babylon. The Vulgate may be explained as referring to the time preceding the captivity. Neither ſacred nor profane hiſtory, in the time of Manaſſeh, or in that of Zedekiah, either before or after the captivity, ſay any thing of a king of Nineveh, named Nebuchodonoſor, who in the 12th and 17th years of his reign conquered a king of the Medes, called Arphaxad. It would alſo be hard to find at this particular time an high-prieſt of the Jews, whoſe name was Joachim or Eliakim. We ſhould likewiſe meet with invincible difficulties, in reconciling the Greek text and the Syriac with the Latin of St. Jerom; nor would there be perhaps leſs, if we were to adhere only to the Vulgate, and reject the Greek, Syriac, and old Italic verſions. If the names were granted, it is not eaſy to determine whether we ſhould adopt the Greek or the Latin text. As to the Syriac, it was taken from the Greek, and from the Greek only one might infer, that the ſtory of Judith was tranſlated and written after the captivity; but if we follow the Latin, it may be placed before the captivity. The Greek text is very ancient: ſome ſuppoſe it to be Theodotion's, who lived under Commodus, after A.D. 180; but it muſt be more ancient, becauſe it is cited by Clemens Romanus in his epiſtle to the Corinthians, written above 120 years before. The Syriac likewiſe is very ancient, and tranſlated from ſome Greek text more correct than any we have at preſent; but the ſame as to ſubſtance. The Latin Italic verſion, or the old Vulgate, is made likewiſe from the Greek, but it is very defective. St. Jerom's Vulgate was tranſlated from a Chaldee text, which St. Jerom took to be the genuine original of Judith; but he leaves the ſubject in a very perplexed and unſatisfactory ſtate. With the old Latin verſion before him, he omitted what was ſuperfluous; and reſerved all that was found agreeing with the Chaldee, and probably added what was wanting, ſo that his verſion is rather a reform of the old, than a tranſlation altogether new; and ſome words are obſerved in it which are taken from the old Italic. They who maintain, that the hiſtory of Judith contained what paſſed before the captivity, and in Manaſſeh's time, believe it ſufficient to demonſtrate, that there is nothing in the hiſtory repugnant to this aſſertion. The opinion, which places the hiſtory of Judith after the captivity of Babylon, is founded principally on the authority of the Greek verſion, which is certainly, as we have already ſaid, very ancient; and it may paſs for an original, there being nothing more ancient and authentic; for it is dubious, whether St. Jerom's Chaldee were the original text of this work. After all, what ſeems demonſtrative for the opinion, which places this after the return from the Babyloniſh captivity, is the import of the Greek, chap. iv. 2. In this opinion almoſt all the ancients, and many of the moderns, have concurred. Euſebius places it in the reign of Cambyſes, Syncellus in that of Xerxes, Sulpitius Severus in that of Ochus; others under Antiochus Epiphanes, and in the time of the Maccabees.

Dr. Prideaux ſuppoſes, that the Nebuchodonoſor of the book of Judith is Saoſduchinus, king of Babylon, who commenced his reign in the 31ſt year of Manaſſeh, and that Arphaxad is Deioces, king of Media ; and that the deſtruction of Holofernes and his army at Bethulia took place in the 44th year of Manaſſeh, B.C. 655. He further ſuppoſes, on the authority of St. Jerom, that this book was originally written in the Chaldee language, and tranſlated by Jerom into the Latin tongue, which is the tranſlation that is now extant in the vulgar Latin edition of the Bible. The Engliſh tranſlation, which we at preſent have among the apocryphal writings in our Bible, as well as the Syriac, was made from the Greek.

Whether the book of Judith be authentic and canonical is a point that has been very much diſputed. The Jews read it in St. Jerom's time ; St. Clement hath cited it in epiſt. 1. ad Corinth., as well as the apoſtolical conſtitutions, Clemens Alexandrinus, Origen, Tertullian, St. Ambroſe, and St. Jerom. Jerom ſays, in his preface to the book of Judith, that the council of Nice received it among the canonical books, though no canon was made to approve it. St. Athanaſius, or the author of the Synopſis, gives a ſummary account of it. St. Auſtin, and the whole African church, received it. Pope Innocent I., and pope Gelaſius, acknowledged it. The council of Trent hath alſo confirmed this book. The Romaniſts of courſe, having received this book into the canon of divine writ, hold the hiſtory recorded in it to be true. On the other hand, it is the opinion of Grotius, that it is wholly a parabolical fiction, written in the time of Antiochus Epiphanes, when he came into Judea to raiſe a perſecution againſt the Jewiſh church ; and that the deſign of it was, to confirm the Jews under that perſecution, in their hopes that God would ſend them a deliverance : accordingly " by Judith is meant Judea ; by Bethulia the temple or houſe of God ; and by the ſword which went out from thence, the prayers of the ſaints ; that Nebuchodonoſor doth there denote the devil, and the kingdom of Aſſyria, the devil's kingdom, pride ; that by Holofernes is there meant the inſtrument or agent of the devil in that perſecution, Antiochus Epiphanes, who made himſelf maſter of Judea, that fair widow, ſo called, becauſe deſtitute of relief ; that Eliakim ſignifies God, who would ariſe in her defence, and at length cut off that inſtrument of the devil who would have corrupted her." Many learned writers among the Proteſtants, though they do not adopt the peculiar fancy of this great man, agree with him in the general, that this book is rather a parabolical than a real hiſtory, deſigned for the inſtruction and comfort of the Jews under that figure, and not to give them a narrative of any thing that was really done ; and their reaſon is, that they think it utterly inconſiſtent with all times, where it hath been endeavoured to be placed, either before or after the captivity of the Jews. Dr. Prideaux thinks that by putting it in the time of Manaſſeh he removes all the objections which are alleged to prove its inconſiſtency with the times after the captivity, which he thinks are unanſwerable.

After examining a variety of objections relating to this book and its hiſtory, Dr. Prideaux concludes, " that if any one will ſtill contend, that it is only a religious romance, and not a true hiſtory ; that, according to the intention of the author, the ſcene of it was put under the reign of Xerxes, when Joakim, the ſon of Joſhua, was high-prieſt, and the civil government of Judea, as well as the eccleſiaſtical, was in the hands of that officer : and that the inconſiſtency of ſo many particulars in that book, with the ſtate and tranſactions of thoſe times, was only from the ignorance of the author in the hiſtory of the ſaid times, and his unſkilfulneſs in placing the ſcene of his hiſtory in them ; I ſay, if any will inſiſt on all this, notwithſtanding what is above ſaid, I ſhall not enter into any controverſy with him about it : only thus much I muſt inſiſt on, that if it be a true hiſtory (which I am inclined moſt to think, though I will not be poſitive in it), it can fall no where elſe but in the time where I have laid it."

The author of the book of Judith is unknown. St. Jerom ſeems to think that it was written by Judith herſelf ; others imagine, that the high-prieſt Joachim or Eliakim, mentioned in this book, was the author : but all this is mere conjecture. Thoſe who believe that the hiſtory of Judith happened in the time of Cambyſes, and after the captivity of Babylon, ſuppoſe that Joſhua, the ſon of Joſedek, then high-prieſt, wrote it. The author, whoever he was, does not appear to have been contemporary with the tranſactions. He ſays, that Achior's family was ſtill in his time ſubſiſting in Iſrael, Judith, xiv. 6. and that the feſtival inſtituted in memory of Judith's victory was ſtill celebrated, Judith, xvi. 31. Dupin on the Canon. Prideaux's Conn. v. 1. Calmet.

JUDOIGNE, in *Geography*. See JODOIGNE.

JUDOMA, a river of Ruſſia, in the government of Irkutſk, which joins the Maia, N. lat. 58° 50'. E. long. 134° 14'.

JUDOOK, a town of Bengal ; 18 miles N. of Dacca.

JUDOSA BAY, a bay of Louiſiana, which lies in the N.W. corner of the gulf of Mexico ; connected by a chain of iſlands towards the S.W. with St. Bernard's bay.

JUEFRAS, a town of Africa, in the kingdom of Barra.

IVEL RIVER, in Bedfordſhire, is navigable from Temsford to the town of Biggleſwade : it does not appear, that any ſteps have yet been taken for extending this navigation up to Shefford, agreeably to the act for that purpoſe, which paſſed in the 30th year of Geo. II. : the private intereſts of the merchants of Biggleſwade ſeem a more effectual bar to the completion of this object, than the want of money, which has been ſo often inſiſted on.

IVELCHESTER *and* LANGPORT CANAL, is the parliamentary name of an inland navigation in Somerſetſhire, about ſeven miles long, from the Parret river, near Langport, to the town of Ilcheſter, made in purſuance of the act obtained in the year 1795. See CANAL.

IVENACK, a town of the duchy of Mecklenburg ; 30 miles S.E. of Roſtock.

IVERAGH. See KERRY.

IVERSKOI, a town of Ruſſia, in the government of Novgorod ; 80 miles S.E. of Novgorod.

IVES, SIMON, in *Biography*, was a lay vicar of St. Paul's cathedral, till driven thence by the republicans ; when he became a ſinging-maſter, and a teacher of muſic in private families.

During the reign of Charles I., Ives ſtood high as a compoſer, as we are told in the MS. account of the maſque intitled " The Triumphs of Peace," written by Shirley, a dramatiſt of the ſecond claſs, which was acted at Whitehall in 1633, and the whole expence of the proceſſion defrayed by the gentlemen of the four inns of court, as a teſtimony of duty and loyalty on his majeſty's return from Scotland, after terminating the diſcontents of that kingdom.

A very circumſtantial account of this maſque by the lord commiſſioner Whitelocke, in his own hand-writing, has been preſerved. It was the property of the late Dr. Morton of the Britiſh Muſeum. In this narrative, the commiſſioner, who was the principal manager of the exhibition, ſays : " I made choyce of Mr. Simon Ives, an honeſt and able muſitian,

ſitian, of excellent ſkill in his art, and of Mr. Lawes, to compoſe the aiers, leſſons, and ſongs for the maſque, and to be maſters of all the muſicke under me."

The compoſitions of Simon Ives are not devoid of merit; ſome of his rounds and catches, publiſhed in Hilton's collection, ſtill live; "Come honeſt friends and jovial boys," &c.

In Playford's Muſical Companion, and among the "Ayres and Dialogues" publiſhed in his time, there are ſeveral ſongs ſet by Ives, who died in 1662, in the pariſh of Chriſtchurch, London.

Ives, *St.*, in *Geography*, is a populous borough, market and ſea-port town, in the hundred of Penwith and county of Cornwall, England. It is ſituated near the north-eaſt angle of a fine bay, which is bounded by bold rocks of black killas. The church is a low, but ſpacious building, having a nave and two aiſles: from its ſituation near the ſhore, it is frequently covered, at high tides and tempeſts, with the ſpray of the ſea. The chief articles exported from this town are ſlate and pilchards. The latter are in moſt ſeaſons taken in the bay in great abundance; and at the time of large draughts, it is uſual for all the inhabitants to contribute their aſſiſtance: the ſhops are then deſerted; and if it ſhould be Sunday, even the church is likewiſe abandoned. This port, as well as moſt others on the north coaſt, is greatly incommoded by the ſhoals of ſand driven in by the north-weſt winds: and the town, as appears from Leland, has alſo ſuffered from the ſame cauſe. In the reign of queen Mary, St. Ives was governed by a portreve and burgeſſes; but was not incorporated till the ſixteenth year of Charles I., who confirmed ſome former privileges, veſted the future government of the town in a mayor, recorder, twelve capital and twenty-four inferior burgeſſes, and granted the inhabitants four annual fairs, two weekly markets, Wedneſday and Saturday, and alſo endowed a grammar ſchool. Two members are returned to parliament from this borough: the right of election is poſſeſſed by the corporation, and all the inhabitants paying ſcot and lot; the number of voters being about 180. St. Ives is diſtant from London 275 miles: the number of houſes was eſtimated, under the population act of 1800, as 540, inhabited by 2714 perſons. Beauties of England and Wales, vol. ii. Polwhele's Hiſtory, &c. of Cornwall.

Ives, *St.*, a market town and pariſh in the hundred of Hurſtingſtone, Huntingdonſhire, England, is ſituated on the banks of the river Ouſe. It was called, in the Saxon times, Slepe, and is mentioned by that appellation in the Domeſday book: but it afterwards obtained the name of St. Ives from Ivo, a Perſian archbiſhop, who is reported to have travelled through England, preaching the goſpel, about the year 600. On the ſpot where the remains of this ſaint were reported to have been found, abbot Ednoth built a church; and ſoon afterwards, anno 1017, a priory was erected by earl Adelmar, who brought hither ſome Benedictine monks from the abbey of Ramſey. After the diſſolution of monaſteries, the ſcite of this priory was granted, 36 Henry VIII., to ſir Thomas Audley. The priory, barn, and dove-houſe are yet ſtanding, but do not exhibit any thing worthy of notice. The pariſh church is a neat edifice; its ſpire has been twice blown down. The other places for religious worſhip in this town are, two meetings for Baptiſts, one for Quakers, and one for Preſbyterians: the latter had its riſe at the period of the civil wars of the ſeventeenth century, when the ejected miniſter of St. Ives was ſupported by the inhabitants in oppoſition to the reigning powers. Great part of the town was deſtroyed by a fire on the 30th of April 1689: it began in a malt-houſe at the end of White-hart-lane; and laid in aſhes the dwellings and property of upwards of an hundred families. The lower part of the town, from its vicinity to the river Ouſe, has been frequently overflowed. Over the river is a ſtone bridge, with four pointed, and two ſemicircular arches. The charter for the market was granted by king Edward I. about the year 1290: it is held on Mondays, and is one of the largeſt in the kingdom for cattle, ſheep, pigs, and poultry; being conſidered as ſecond only to that of Smithfield in London. Here are alſo two well frequented fairs, held annually, at Michaelmas and Whitſuntide: the former ſprung from an annual meeting appointed in 1020, to be held on the feaſt of St. Michael; the latter was granted by a charter of Henry I., dated in 1110, and was privileged to continue from "Whit-Monday till the Monday following, and all that day." Several breweries and malt-kilns are eſtabliſhed in the town: the inns and public-houſes are numerous. Many charitable donations are recorded on two tablets in the church, but the gifts are not large. St. Ives is 60 miles diſtant from London: the population, as returned under the act of 1801, amounted to 2099, inhabiting 478 houſes. In the pits in the neighbourhood of this town, the cornua ammonis, belemnites, and other foſſils, are occaſionally found. Beauties of England and Wales, vol. vii.

IVETEAUX, Nicholas Vauquelin, in *Biography*, celebrated as a French poet, was born at Freſnaye, near Falaiſe, about the year 1559. His father, Vauquelin de la Freſnaye, was eminent for his poetry, and had the office of lieutenant-general of the bailiwick of Caen, which he readily made over to his ſon, but he was ill adapted to the duties of the ſituation, and after another change or two he was appointed preceptor to the duke of Vendome, natural ſon of Henry IV. He was next engaged in the ſame buſineſs with regard to the dauphin, afterwards Louis XIII., but not giving ſatisfaction, he was diſcharged with a penſion and two abbacies. Theſe, on account of ſome irregularities, he was obliged to reſign, and then retired to a good houſe in the Fauxbourg St. Germain, where he adopted an epicurean life: after this he retired to a country ſeat in the dioceſe of Meaux, where he died, in 1649, at the age of ninety. The works by which he is known are "Inſtitution d'un Prince," a poem written with force and ſolidity, and containing excellent leſſons of morality: and "Stanzas, Sonnets, and other Poems." Moreri.

JUFFERS, among *Carpenters*, a term uſed for pieces of wood about four or five inches ſquare, and of ſeveral lengths.

JUFOSTA, in *Geography*, a town of Arabia, in the province of Oman; 160 miles E.S E. of El-Catif.

JUG, an earthen pot or pitcher to hold drink; alſo a term uſed in many parts for a common, paſture, or meadow.

JUGANG, in *Geography*, a town of Thibet; 30 miles E.N.E. of Zuenga.

JUGDALLIK, a town of Candahar, on the Kameh; 35 miles E.S.E. of Cabul.

JUGDEES, a town of Hindooſtan, in Oude; 31 miles N.E. of Allahabad.

JUGDISPOUR, a town of Hindooſtan, in Bahar; 15 miles S.W. of Arrah. N. lat. 25° 27′. E. long. 83° 36′.—Alſo, a town of Hindooſtan, in Bahar; 8 miles S. of Bettiah. N. lat. 26° 39′. E. long. 84° 51′.—Alſo, a town of Hindooſtan, in Oude; 44 miles N. of Manickpour.—Alſo, a town of Hindooſtan, in Oude; 46 miles W.S.W. of Kairabad.

JUGERUM, a Roman meaſure, the double of the actus quadratus. It was a ſquare of 120 Roman feet. The jugerum was divided into 12 unciæ, and the unciæ into 24 ſcrupulæ. Its proportion to the Engliſh acre is as 10,000 to 16,097.

JUGHIGOPA, in *Geography*, a town of Bengal; 27 miles E. of Rangamutty.

JUGK, a town of Pruſſia, in the province of Natangen; 10 miles N.W. of Lick.

JUGLANS, in *Botany*, ſo called by the Roman writers, on account of the excellence of the nut. It is contracted from *Jovis glans,* the acorn or maſt of Jove.—Walnut-tree, Linn. Gen. 496. Schreb. 645. Willd. Sp. Pl. v. 4. 455. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 360. Juſſ. 375. Lamarck. Dict. v. 4. 500. Illuſtr. t. 781. Gærtn. t. 89. (Nux; Tournef. t. 346.) Claſs and order, *Monœcia Polyandria.* Nat. Ord. *Amentaceæ,* Linn. *Terebintaceæ,* Juſſ.

Gen. Ch. Male, *Cal.* Perianth elliptical, flat, divided into ſix, depreſſed, concave, obtuſe ſegments. *Cor.* none. *Stam.* Filaments from eighteen to twenty-four, very ſhort; anthers oval.—Female, *Cal.* Perianth of one leaf, bell-ſhaped, four-cleft, erect, very ſhort, ſingle-flowered. *Cor.* of one petal, four-cleft, erect, acute, a little longer than the calyx. *Piſt.* Germen inferior, oval, large; ſtyle very ſhort; ſtigmas two, reflexed, jagged at the extremity. *Peric.* Drupa dry, oval, large, of one cell. *Seed.* Nut large, roundiſh, reticulated with furrows; kernel four-lobed, variouſly furrowed.

Eſſ. Ch. Male, Calyx depreſſed, ſix-lobed. Corolla none. Stamens about twenty. Female, Calyx four-cleft, ſuperior. Corolla four-cleft. Styles two. Drupa with a furrowed lobed kernel.

1. J. *regia.* Common Walnut-tree.—Linn. Sp. Pl. 1415. Mill. Illuſtr. t. 81.—Leaflets about nine, oval, ſmooth, ſlightly ſerrated, equal. Fruit globoſe.—A native of Perſia, and alſo of the northern parts of China. It flowers in the ſpring, and bears fruit in autumn. A large and handſome *tree,* with ſtrong ſpreading boughs. *Leaves* pinnate, extremely fragrant; the end leaflet ſtanding on a foot-ſtalk. *Male-flowers* in a cloſe, pendulous ſpike. *Females* ſcattered, frequently two or three together.—*Fruit* an ovate, ſmooth nut, containing a white, delicious, oily kernel, whoſe ſurface is rugged, and covered with a tough, yellowiſh ſkin.—The walnut-tree is univerſally known and admired for the ſplendour of its foliage, the delicacy of its fruit, and the utility of its wood.—There are many varieties of the ſpecies in queſtion, well known to cultivators. It was formerly more propagated in Britain than at preſent, for its wood, which was in very great eſteem, till the introduction of mahogany ſomewhat ſuperſeded its uſe, but is ſtill in great requeſt for furniture in various parts of the continent; with us it is valued chiefly for gun-ſtocks, the demand for which, of late years, has cauſed great devaſtation among our walnut-trees, a circumſtance worthy the attention of perſons who make planting an object either of pleaſure or profit. The unripe fruit is frequently converted into a pickle or preſerve.

2. *J. alba.* The Hickery, or White Walnut-tree.—Linn. Sp. Pl. 1415.—Leaflets ſeven, oblong-lanceolate, pointed, ſerrated, pubeſcent underneath; the odd one ſeſſile. Fruit nearly quadrangular, ſmooth.—Native of North America.—*Leaves* compoſed of two or three pairs of oblong leaflets, terminated by an odd one, which is ſeſſile. *Fruit* ſhaped ſomewhat like a common walnut, but the ſhell is not furrowed, does not ſplit aſunder, and is of a lighter colour.—Cateſby deſcribes this as a very large tree, with a trunk two or three feet in diameter, the leaves differing from the laſt not only in being ſerrated, but narrower, and more pointed. The ſhell is ſo very hard that it cannot eaſily be broken. The kernel is ſweet and well-taſted, affording a wholeſome and pleaſant oil.

3. *J. nigra.* Black Walnut-tree.—Linn. Sp. Pl. 1415. Jacq. Ic. Rar. t. 191.—Leaflets about fifteen, oblong-lanceolate, ſerrated. Fruit globular, roughiſh, dotted.—Found from Pennſylvania to Florida. It flowers in April and May. This is alſo a large *tree.* *Leaves* compoſed of ſix or ſeven pairs of leaflets, which are acute and ſerrated, emitting a ſtrong aromatic flavour. Outer cover of the *nuts* rough; theſe are rounder than the common walnut. *Shell* hard and thick; kernel very ſweet. The wood is the moſt valuable of all walnut-trees, being very finely veined, and capable of receiving a high degree of poliſh. There were large trees of the Black Walnut in Chelſea garden in 1759, which had produced abundance of fruit for upwards of forty years.

There are ſeveral other ſpecies of *Juglans,* chiefly, if not entirely, natives of America, all remarkable for the excellence of their wood. Willdenow enumerates eleven—profeſſor Martyn eight.

Of theſe *J. cinerea,* the Aſh-coloured Walnut, Jacq. Ic. Rar. t. 192. and *J. baccata,* the pulpy-coated walnut, figured in Sloane's Jamaica, t. 157. f. 1, are the only remaining Linnæan ones. Of the genus of the latter we preſume there muſt be conſiderable doubt.

Juglans, in *Gardening,* compriſes plants of the deciduous, hardy tree kind, of which the ſpecies moſtly cultivated are, the common walnut-tree (J. regia); the white walnut-tree (J. alba); and the black walnut-tree (J. nigra).

It is remarked of the firſt ſort by Martyn, that, as "they all vary again when raiſed from the ſeed, and that as nuts from the ſame tree will produce different fruit; perſons who plant the walnut for its fruit, ſhould make choice of the trees in the nurſeries, when they have their fruit upon them."

The principal varieties are, the oval walnut, the round walnut, the large walnut, the ſmall-fruited walnut, the double walnut, the early walnut, the late walnut, the tender-thin-ſhelled walnut, and the hard thick-ſhelled walnut.

Method of Culture.—It may be obſerved that all the ſorts are capable of being increaſed by planting the ſeed or nuts, which in the firſt ſpecies ſhould be of the beſt varieties when intended as fruit-trees, which, after they are become perfectly ripe, and have been preſerved in dry ſand till about the end of February, ſhould be ſet either in ſlight drills, five or ſix inches apart in the rows, and a foot diſtant, or by the dibble, at the ſame diſtance, putting them into the depth of two or three inches, the ground having been previouſly well dug over. When the plants have had two years' growth in the ſeed-bed, they ſhould be removed into nurſery rows, ſhortening the tap roots, but preſerving the tops entire, putting them at the diſtance of two feet and a half from row to row, and a foot and a half in the rows; they ſhould remain in this ſituation till they have attained five or ſix feet in height, training them with ſingle ſtems; after which they may be removed into the ſituations where they are to grow.

When the trees are intended for timber, it is a good practice to plant them out at once where they are to grow, as they thrive faſter, and form better trees.

But in raiſing the walnut for fruit, Mr. Boutcher recommends flat-ſtones, tile-ſhords, or ſlates, to be buried eight inches deep, under the nuts when they are ſet: the diſtance to be ſix inches, and the depth two inches. After two ſeaſons, they ſhould be removed early in autumn, and planted fourteen or ſixteen inches aſunder, on the ſame kind of bottom,

tom, or any hard rubbiſh, to prevent them from ſtriking downwards, and to induce them to ſpread their roots on the ſurface. At the end of two or three years this ſhould be repeated again, making the bedding at the depth of fifteen or ſixteen inches, and planting them two feet aſunder: here let them remain three or four years, when they will be fit to remove for the laſt time. The ſoil for fruit-trees ſhould be dry and ſound, with a ſandy, gravelly, or chalky bottom. The trees managed in this way will have higher flavoured fruit, ripen earlier, and bear a plentiful crop twenty years ſooner than in the uſual method. The beſt manure for them is aſhes, ſpread the beginning of winter, the land having been firſt ploughed or dug over.

And as plants raiſed from the nuts of the ſame tree bear fruit of very different qualities, he adviſes the inarching one of the beſt ſorts on the common walnut-tree; by which method the planter is ſecure of his ſort, and will have fruit in one-third of the time that he would obtain it from the nut. This method can, however, be practicable only in few ſituations. The length of time in which the walnut bears well from the nut, is about twenty years.

The nuts of the two other ſorts are procured from America by the nurſerymen.

Plants of the firſt ſort are cultivated for ornament, as well as the nut or fruit which they afford. The fruit is uſed in two different ſtages of its growth; as, when green, to pickle; and, when ripe, to eat the kernel. For the firſt purpoſe, the young green walnut, when about half or near three parts grown, before the outer coat and internal ſhell become hard, is moſt excellent; for which they are generally ready in July or the following month, and ſhould be gathered by hand, chooſing ſuch as are as free from ſpecks as poſſible.

The fruit is diſcovered to be fully ripe by the outer huſk eaſily ſeparating from the nut, or by the huſks ſometimes opening, and the nuts dropping out; it is uſually about the latter end of September, which, in trees of conſiderable growth, is commonly beaten down with long poles; for, as the walnuts grow moſtly at the extremity of the branches, it would, in very large ſpreading trees, be troubleſome and tedious work to gather them by hand. As ſoon as gathered, they ſhould be laid in heaps a few days to heat and ſweat, to cauſe their outer huſks, which cloſely adhere, to ſeparate from the ſhell of the nuts; then be cleared from the rubbiſh, and depoſited in a dry room for uſe, covering them over cloſe with dry ſtraw, a foot thick, where they will keep three or four months. They are always ready ſale at market, in large towns, where, at their firſt coming in, they are brought with their huſks on, and ſold by the ſack, or buſhel, but afterwards cleaned, and ſold both by the meaſure and the thouſand.

Plantations of theſe trees are therefore profitable, in their annual crops of fruit, while growing, and in their timber, when felled or cut down.

Theſe, as well as the other ſorts, may many of them be admitted into clumps or plantations, in large pleaſure-grounds, for variety. After one or two years, the other ſorts are nearly as hardy as the firſt; but till that time ſhould be protected againſt froſts in the winter ſeaſon.

Juglans *Regia*, *Common walnut-tree*, in the *Materia Medica.* The unripe fruit has an aſtringent bitteriſh taſte, and has been long uſed as a pickle. This is the part directed for medicinal uſe by the London college, on account of its anthelmintic virtues. Its effect in deſtroying worms ſeems to be confirmed by the teſtimony of ſeveral authors; and in proof of its poſſeſſing this vermifuge power, we are told that water, in which the green ſhells of walnuts have been macerated, on being poured in a garden, was found to drive all the earth-worms together as far as the water extended; and that the worms, by being immerſed in a ſtrong infuſion of theſe ſhells, were immediately ſeized with ſpaſms, and died in two minutes afterwards. An extract of the green fruit is the moſt convenient preparation, as it may be kept for a ſufficient length of time, and made agreeable to the ſtomach of the patient by mixing it with cinnamon-water. This fruit, in its immature ſtate, is alſo ſaid to be laxative, and of uſe in aphthous affections and ſore throats. The Wirtemberg Pharmac. directs a rob for the above purpoſes to be prepared of its juice. The kernel of the walnut is ſimilar in qualities to that of the almond and hazel nut, and affords an oil, which amounts to half the weight of the kernel. This oil is ſaid not to freeze by cold, and to anſwer the medical purpoſes of the oil of almonds. Vinegar, in which walnuts have been pickled, has been found to be a very uſeful gargle. Woodv. Med. Bot.

JUGLERS. See Provençal *Poets*.

JUGON, in *Geography*, a town of France, in the department of the North Coaſts, and chief place of a canton, in the diſtrict of Dinan; 10 miles W. of Dinan. The place contains 408, and the canton 9911 inhabitants, on a territory of 147½ kiliometres, in 8 communes.

JUGRAT, a town of Hindooſtan, in the circar of Chanderee; 15 miles N. of Chanderee.

JUGULAR, among *Anatomiſts*, is applied to certain veins of the neck, which terminate in the ſubclavians. See Vein.

Jugular *Vein, how to puncture in bleeding.* See Venesection.

Jugular is alſo applied to certain glands in the neck, in the ſpaces between the muſcles. See Glands.

JUGULARES, in the *Linnæan Syſtem*, is the name of an order or diviſion of fiſh, the general character of which is, that they have ventral fins before the pectoral fins, and oſſiculated bronchiæ. This order comprehends ſix genera; viz. *callionymus*, *uranoſcopus*, *trachinus*, *gadus*, *blennius*, and *kurtus*; which ſee reſpectively.

JUGURTHA, in *Biography*, king of Numidia, was the natural ſon of Manaſtabal, one of the three ſons of Maſſiniſſa, who, after the death of that prince, poſſeſſed the kingdom jointly. Miſcipſa, the ſurvivor, and who inherited his father's kingdom, educated his nephew Jugurtha with his two ſons Adherbal and Hiempſal; but as he was of an aſpiring diſpoſition, he ſent him with a body of troops to the aſſiſtance of Scipio, who was beſieging Numantia, hoping to loſe a youth whoſe ambition ſeemed to threaten the tranquillity of his children. His hopes were fruſtrated, and Jugurtha returned with great glory, having alſo acquired the friendſhip of his general Scipio Africanus. Miſcipſa appointed him ſucceſſor to his kingdom with his two ſons, but the kindneſs of the father proved fatal to the children. Jugurtha cauſed Hiempſal to be aſſaſſinated, and ſtripped Adherbal of his poſſeſſions, and obliged him to fly to Rome for ſafety. The Roman people liſtened to the well-grounded complaints of Adherbal, but Jugurtha's influence prevailed among the ſenators; and the ſuppliant monarch, forſaken in his diſtreſs, periſhed by the ſnares of the enemy, and with every circumſtance of cruelty. Theſe atrocities excited ſuch a flame at Rome, that the ſenate, in effect, declared war againſt Jugurtha. Cæcilius Metellus was ſent againſt him, and by his firmneſs and ſucceſs, the Numidian was forced to ſeek ſupport from his ſavage neighbours. A variety of actions enſued, in which the Roman arms were moſtly ſucceſsful, though Jugurtha, ſkilfully purſuing the Numidian mode of warfare, did not ceaſe to haraſs his enemies, and oppoſe obſtacles to their attempts. Marius and Sylla ſucceeded Metellus, and fought with equal ſucceſs; at length they perſuaded Bocchus, a Mauritanian king, who was in alliance with Jugurtha, and his near relation, to enter into negociations of peace. By tempting offers he agreed to betray Jugurtha, and put him into the hands of his enemies: he was accordingly delivered up to Sylla, after a war of five years. Sylla carried him in chains to Cirtha, whence he was ſent to Rome in the year 106 B C. and the joy teſtified on beholding him there in the condition of a captive, was a proof of the dread which he had inſpired as an enemy. He was expoſed to the view of the Roman people, and dragged in chains with his ſons to adorn the triumph of Marius, after which he was inſulted by the populace, and remanded to his dungeon, where he was either ſtrangled or ſuffered to periſh with hunger. He left two ſons, who ſpent their days in captivity; and his dominions were divided between Bocchus, the remaining heirs of Maſſiniſſa, and the Roman republic. Salluſt. Bell. Jugur. Univerſal Hiſtory.

JUHOO, in *Geography*, one of the mouths of the Indus; 10 miles W. of the Ritchel.

IVIÇA, IBIÇA, *Ebuſus*, the largeſt of the *Pityuſe* iſlands See PITYUSE.

This iſland is about 15½ leagues from the iſland of Majorca, which lies to the N.E. It is commonly ſaid to be ſeven leagues long, and about 4½ broad in certain places, and 22 leagues in circumference. It is high, and covered with mountains, whoſe verdant declivities preſent an agreeable and pictureſque proſpect from the ſea. The ſoil is adapted to every kind of culture. This iſle is divided into five parts, or quartones, *viz.* the plain of the city, St. Eulalia, Balanzar, Pormany, and the Salines. The *Plain* of the town occupies a ſpace of about 1½ league, and contains 200 houſes, ſeparated into little hamlets, the population of which is eſtimated at about 900 inhabitants. The canton preſents on all ſides well cultivated gardens and vineyards. The city furniſhes a ſort of militia, conſiſting of about 1120 men, for the ſafety of the diſtrict. The diſtrict of *St. Eulalia* has a territory of about four leagues in extent, bordering on thoſe of Balanzar and Iviça, and lies to the N E. of the latter. The number of houſes is about 700, diſperſed, without forming towns, villages, or hamlets. They are inhabited by 4000 perſons, diſtributed in two pariſhes. A river, bearing the name of the Saint, flows at the foot of the mountain, where the ſpire of the church of St. Eulalia riſes. The other pariſh is called St. John's. This diſtrict furniſhes a contingent of 700 men for the ſecurity of the iſland. The territory of the diſtrict of *Balanzar* extends over about three leagues, and joins thoſe of Iviça, St. Eulalia, and Pormany. The houſes are reckoned at about 400, and the inhabitants may amount to 2200. The pariſh church is dedicated to St. Michael. The contingent for the ſafeguard of the iſland conſiſts of 300 men. On the coaſt is ſituated the creek of Balanzar, near a mile in length. At the end is the little port of San Michela, which can only admit ſmall veſſels. This port is at the mouth of two rivulets, the ſources of which are upwards of a league in the interior. The diſtrict of *Pormany* has a territory four leagues in length, bounded by Balanzar, Salines, and Iviça. The ſoil preſents a fertile plain, on which are about 450 houſes, containing at leaſt 2000 inhabitants, and furniſhing a contingent of 350 men. The principal church is conſecrated to St. Antony, and its ſteeple, or turret, commands the port, and is guarded by two pieces of cannon, and ſome artillery men. The other church is dedicated to St. Joſeph. The diſtrict of *Salines*, or las Salinas, takes its name from the ſalt found there, and is bounded by the diſtricts of Pormany and Iviça. It is two leagues in extent; the houſes are reckoned at 150, and the population at 900 perſons. The contingent conſiſts of a company of 200 men. On a beautiful plain in this canton is ſituated the church of St. George. Port St. Antony, or Porto-magno, or Pormany, lies on the oppoſite coaſt. Iviça, though its mouth is difficult of entrance, is ſufficiently ſpacious to accommodate a ſquadron; but in the winter ſeaſon it is only fit for ſmall veſſels. The iſlanders of Iviça have criminal as well as civil laws peculiar to themſelves. This iſland belongs to the Spaniards.

IVIÇA, the capital town of the above deſcribed iſland; which has a good port, ſituated to the S.E. below a ſmall hill, under the cannon of a fortreſs conſtructed in the time of Charles V. Some ancient authors aſcribe the foundation of this city to the Phœnicians, 663 years B.C. It was called Pityuſa, becauſe it is covered with pines and firs. Others attribute it to the Carthaginians, 70 years after Carthage was founded, alleging that the name Ebuſus in the Punic language ſignifies arid. The Romans had it in their poſſeſſion; it was afterwards occupied by the Moors; but the Africans were expelled by John, prince of Aragon, archbiſhop of Tarragona; and it has ſince remained under the ſpiritual juriſdiction of this city. The town, which is ſituated on a mountain, is honoured with the title of a biſhopric, and it is alſo the ſeat of government. It has a cathedral, as many monaſteries as pariſhes, one hoſpital, ſeveral churches, and ſome barracks. The town is well fortified, and has two entrances, *viz.* the New Gate, and the Principal. The ſuburbs, commanded by the cannon of the town, contain one church, called St. Elmo, well filled with ſailors. The port, though ſpoiled by the mud, is large enough to contain a ſquadron; it is the largeſt, moſt convenient, and beſt ſheltered in the iſland. The N.E. wind is the only one from which it is not protected. The Engliſh took poſſeſſion of this port in 1706; but the Spaniards have again obtained it. The governor has an aſſeſſor, and ſome other perſons, who aſſiſt him in taking cognizance of all civil, criminal, and military matters, from whom the appeal lies to the captain-general of Majorca. Including the inhabitants of the ſuburb, the population is eſtimated at 800 families, comprehending 3600 perſons. N. lat. 38° 58′. E. long. 1° 22′.

JUICE, a liquid ſubſtance, which makes part of the compoſition of plants; being diffuſed among all the ſolid parts, and ſerving for their nutriment and growth.

The juice, or ſap, is that to plants, which blood is to animals.

There are juices of divers kinds, *aqueous, vinous, oleaginous, gummous, reſinous,* and *bituminous*; and of all taſtes and colours.

JUICE, *Spaniſh*. See LIQUORICE.

JUICE is alſo applied to ſeveral, and even to all, the fluids, or humours, in an animal body.

JUICE is alſo applied to the vapours and humidities incloſed in the earth.

JUICES, *Concrete*, in *Mineralogy*, a name given by many authors, to ſuch ſubſtances found in the bowels of the earth, as have once been in a ſtate of fluidity, and are capable of being rendered fluid again by art, by means of heat, moiſture, or common agents.

Others apply the word *concrete* to all thoſe ſubſtances which may be ſeparated from fluids by chemical operations, whether they are afterwards ſoluble in them again or not; ſuch are the particles of ſpar, ſeparated from water by a ſlow diſtillation, and remaining at the bottom of the veſſel.

The concrete juices of the earth are ſuppoſed to be the principal things which give the virtue to mineral waters; for thoſe which receive no concretion, and are only mingled with the waters in their paſſage through that part of the earth where they are evaporated, on the water's being expoſed to the air, though they may give a briſkneſs to it, while entire in it, yet are not to be ſuppoſed to give the principal virtues. Theſe fluid and volatile juices all fly off in the analyſes of the waters, but the concrete juices are more permanent, and leave certain ſediments which render them viſible and palpable, after the diſtillation of the waters with which they are mixed. When theſe happen to be ſimple, and of the ſame ſpecies with thoſe known in a ſolid ſtate, it is eaſy to deduce the virtues of the waters from them, and to know what muſt be the effect of ſuch fluids as carry ſpar, ſulphur, vitriol, or other well-known ſubſtances, into the blood; but it ſeldom happens that theſe things are thus contained ſimple and entire in the waters, they are often blended variouſly with one another, and often not the whole of the known body is contained, but the principles that conſtitute ſome part of it, ſuch as the acid of vitriol without its metalline part, the baſis of ſea-ſalt without its acid, and ſo of the reſt.

Salts and earths are evidently the moſt ſenſible and the moſt common matters which are mixed with water, and it is from them in general that the medicinal ſprings take up their virtues. There is ſcarcely any earth that does not contain ſome ſort of mineral ſalt, capable of being waſhed out by water, though it be generally in imperceptible quantities; but where the earths are richer in theſe ſalts, the waters not only take them up, but carry alſo with them the ſeveral finer particles of the earth itſelf, in which they are bedded, and riſing up at ſome ſmall diſtance from the place, they make medicinal ſprings, of virtues anſwerable to the peculiar ſpecies of the ſalt that was lodged there. We are always able to ſeparate, by analyſis, the ſalts and the earths of the mineral waters; but when we have done this, we are not arrived at the end of the taſk, for they are often ſuch mixed ſubſtances, that we can neither know them perfectly as they are, nor ſeparate them.

The four moſt known and frequent of thoſe concrete juices which are called ſalts, are alum, nitre, vitriol, and culinary ſalt; but the examination of the waters of different medicinal ſprings ſhews us, that there are in the earth others very different from theſe, and that perhaps in great numbers. There is in Aſia a native alkali ſalt, or natrum, and in all the mineral waters we celebrate, there is a peculiar ſalt ſeparable by evaporation, which is more nearly allied to this than to any of the other four, to one or other of which it has been the cuſtom to reduce all ſalts; and yet different even from this in ſome reſpects. Beſides this, thoſe juices of the ſaline kind, whoſe diſpoſition to concretion is not yet finiſhed, and whoſe ſtate is, as it were, but in embryo, or the firſt ſtage of being, are not to be known, when ſeparated from the waters to which yet they may have perhaps given virtues greater than the concrete, in what we call its more perfect ſtate, might have given: nay, even thoſe that are more formed, and are already concreted, or in a ſtate capable of concretion, have not ſimple and homogeneous ſubſtances in each of the ſpecies. The ſalt that is called culinary ſalt, is obſerved to have two different portions mixed together; the one is condenſed and cryſtallized by cold and in moiſture, after the evaporation of a part of the water wherein this ſalt hath been diſſolved; and the other will not be cryſtallized nor condenſed, but by a total evaporation of the water. The portion of this ſalt that is cryſtallized by cold and in moiſture, is the moſt ſulphureous, and by its ſulphureity it will mix itſelf with the ſulphureous ſalt of calcined tartar reſolved in a moiſt air, or in common water, without turbidneſs, and without coagulation; but that portion of this common ſalt which is not condenſed but by the total evaporation of the water which had diſſolved it, hath an acidity which inſtantly coagulates the ſalt of tartar diſſolved, and all other ſalts in the ſame ſtate which are ſulphureous and nitrous. It is evident, that while this ſalt is in its embryo ſtate, the one or the other alone of theſe two very different ſubſtances of which it is contained, may be mixed with the waters of a ſpring, and communicate virtues different from thoſe which the whole body of the ſalt would have done. This ſalt alſo being procured by evaporation of the water, or by any other analyſis of it, could not be known or referred to the common ſalts, and much leſs if in the earth, as may very eaſily happen, it ſhould be united with ſome one of the conſtituent parts of ſome other ſalt, in the ſame diſunited or unfaſhioned ſtate.

The vitriol which in a moiſt air yields an effloreſcence upon ſulphureous marcaſites, has likewiſe a juicy portion, condenſible only by a total evaporation of its aqueous humidity; this is of a very acrimonious taſte, of an unctuous ſubſtance, and eaſily runs to water in a moiſt air. This juicy portion of vitriol is very different from that which ſhoots and condenſes in the fluid liquor, by means of the cold. Theſe cryſtals are pure vitriol acid, auſtere, and on being mixed with the ſulphureous and nitrous ſalts, a great quantity of earthy matter precipitates out of them; but the other portion will mix itſelf with theſe ſalts in ſolution, without turbidneſs or emotion, not having, like the former, that acidity upon which the ſulphureous or nitrous ſalts can act; which is exactly contrary to what happens to common ſalt, of which the firſt portion is the moſt ſulphureous, and the latter portion the moſt acid. Nitre is alſo, like the reſt, compoſed of two different ſaline portions, the one more ſulphureous, which cryſtallizes with the cold, and in moiſture, and the other, which remains diſſolved after all the cryſtals are obtained, and which cannot be obtained in a dry form, but by the evaporation of all the humidity. This is leſs ſulphureous than the other part obtained in cryſtals, and has ſome acidity which the other has not.

The firſt embryos of mineral ſalts are nothing elſe but vapours or juices not concreted, but totally volatile or vaporable; of theſe ſome may be condenſed, and in part fixed by the action of fire, or diſengaged from their matrices, and made capable of concretion by means of the air, as is obſerved in certain nitrous, aluminous, and vitriolic ſalts. The ſulphureous part, which is formed in the lime, made of certain hard ſtones burnt in the fire, which is generally allowed to be a ſpecies of nitre, has certainly its ſeminal being in theſe crude ſtones, and in that ſtate of its being, is very different from that which we find after it has paſſed the fire, which, from cold and coagulative, changes into cauſtic and reſolutive. This cold and coagulative quality of this ſtony ſalt, in its firſt ſtate, manifeſts itſelf ſufficiently in the waters of certain rock ſprings, which are very limpid and cold, and breed cold and ſchirrous tumours under the throats of thoſe people who ordinarily drink them, as in the Alps, &c. See BRONCHOCELE.

The ſeminal matter of this ſalt then is wholly altered in its nature by fire, and is rendered ſulphureous and cauſtic as nitre. Fire is able to exalt and alter the ſtate of being of this ſalt, but it is no more able to produce it in theſe ſtones than in the ſhells of oyſters, &c. of which alſo a lime is made, which yields a ſalt not more ſulphureous than this. *Du Clos, Obſerv. ſur les Eaux Miner.*

The ſeminal being of alum and vitriol muſt, in the ſame manner, exiſt in thoſe ſubſtances out of which thoſe ſalts are extracted by water, after they have been calcined by ſire, or expoſed to a ſlower calcination in the open air. They are not found in theſe ſtones before theſe proceſſes, yet it is ſufficiently evident that the ſire and air could not produce them, but could only exalt them there.

All theſe varieties to which the ſeveral mineral ſalts are liable in the different ſtages, and in which they may be abſorbed together, and united by water under the earth, do not only render the judging of the mineral waters, which partake of them by analyſes very uncertain, but even, in many caſes, perplex and confound us, by the very means by which we hope to underſtand them.

Juices, *Mineral.* Many countries afford theſe, and give marks by them of treaſures that might be turned to great account, were the proper manner of aſſaying them known, which is by ſirſt properly reducing them to a dry ſubſtance, ſo as to come at the ſolid matter they contain. With a view to the diſcovery of metallic veins, the erection of ſalt-works, vitriol-works, alum-works, borax-works, and the like, the curious on this ſubject may ſind many excellent hints for farther diſcoveries in the cloſe of Agricola's work, "De Re Metallica;" and the view is farther carried on by Boyle, Becher, Stahl, and Homberg. The Royal Academy of Paris have alſo given ſome hints that may be of uſe, in their Memoirs; and ſome practical things are recorded in the Philoſophical Tranſactions. We have accounts in the Philoſophical Tranſactions of white and thick fluids like cream, found in mines at very great depths, and containing mineral particles. The bottoms of our coal-pits ſometimes afford this liquor in very large quantities. And ſome of the iron mines in Shropſhire, particularly that called the White mine near Hales in that county, affords a great quantity of this ſort of juice. It is thick as cream, white, and of a ſweetiſh taſte, but with a vitriolic twang behind it. This is contained in the nodules of iron-ſtone, which are here a ſort of enhydri, very large, compoſed of thick cruſts, and ſome of them holding near a hogſhead of this ſort of liquor. Phil. Tranſ. N° 100. See Enhydros.

JUILLAC, in *Geography*, a town of France, in the department of the Correze, and chief place of a canton, in the diſtrict of Brives; 19 miles W. of Tulles. The place contains 2010, and the canton 9402 inhabitants, on a territory of 125 kiliometres, in 10 communes.

IVINGHOE, is a market town and pariſh in the hundred of Cotſlow, and county of Buckingham, England. It is ſituated on the declivity of a chalk hill, near the ancient Ikeneld-ſtreet, 35 miles diſtant from London, and conſiſts of two ſtreets, containing, at the time of the late population report of 1800, 78 houſes, and 452 inhabitants. In the church, which is a handſome ſtructure, is an altar-tomb, ſaid to be that of a brother of king Stephen. A market was granted to this town in the year 1318: it is now held on Saturday; but it is ſo ſmall, that it may almoſt be ſaid to be diſcontinued. Here are two annual fairs. The pariſh of Ivinghoe is very extenſive, being fourteen miles in length, and containing ſeveral hamlets. In one of theſe, St. Margaret's, which is about five miles diſtant from the town, are the remains of the monaſtery of Murcſley, founded by Henry de Blois, biſhop of Wincheſter, in the reign of Henry I. for nuns of the Benedictine order. At the diſſolution the ſcite was granted to ſir John Dance: it has been lately ſold by Mr. Catherall, in whoſe family it has been during ſeveral generations, to Mr. Mercer. The building was, in 1802, almoſt entire: the parlour and hall, which are of Toternhoe ſtone, appear to be of the age of Henry VII. Lyſons's Magna Britannia, vol. i.

IVIRA, in *Botany*, a Caribbean name for a ſpecies of *Sterculia*, called by Aublet *Ivira pruriens*, Pl. Guian. v. 2 694. t. 279. See Sterculia.

JUJUBE. See Ziziphus and Rhamnus.

JUJUI, in *Geography*, a river of South America, which riſes W.N.W. of Omaguaca, which gives it name; but afterwards, being joined by ſeveral ſmall rivers at St. Salvador, it is called Jujui. On the borders of the province of Chaco, it unites with the Vermejo in S. lat. 24° 50′. Its whole courſe is S.E. nearly 300 miles.

JUJUMORA, a town of Hindooſtan, in the circar of Sumbulpour; 20 miles S.S.E. of Sumbulpour.

JUKAN, a town of Hindooſtan, in Guzerat; 20 miles N. of Noanagur.

JUKUM, a town of the duchy of Courland; 32 miles E.S.E. of Goldingen.

IULE, in the *Muſic of the Ancients*, Athenæus, lib. xiv. a ſong for woollen manufacturers; but afterwards the ſame author ſays it is the name of one of the ſongs or hymns in honour of Ceres, and it was, in fact, a hymn ſung by the Greeks, and after them by the Romans, in the time of harveſt, in honour of Ceres and Bacchus, in order to render thoſe deities propitious.

The word is derived from ȣλα, or ιȣλα, *a ſheaf.* This hymn was ſometimes called *demitrule,* or *demitriule*, that is, the Iule of Ceres.

JULEP, or Julap, *Julapium*, in *Pharmacy*, and derived, according to Menage, from the Arabic *gieulap*, or rather from the Greek ζȣλαπιον: Olearius derives it from *gulap*, a Perſian word, ſignifying *roſe-water;* is an eaſy, agreeable, extemporaneous potion preſcribed to ſick perſons; uſually compoſed of common water, or ſimple diſtilled water, with one-third or one-fourth its quantity of diſtilled ſpirituous water, and ſweetened with ſugar, or proper ſyrups. This is ſharpened with vegetable or mineral acids, or impregnated with other medicines. Juleps are ſometimes uſed as the ordinary drink in certain diſeaſes, but more uſually as a vehicle for other forms of medicines; ſerving chiefly to dilute, to correct the peccant humours, reſtore the declining force of the heart, and promote ſleep.

In diſpenſatories, we have ſeveral different juleps; the principal of which are, the camphor julep, *julepum e camphora.* See Camphor.

The *cordial* julep, which is made by mixing four ounces of ſimple cinnamon-water, two ounces of Jamaica pepper-water, volatile aromatic ſpirit, and compound ſpirit of lavender, of each two drams, and an ounce of ſyrup of orange-peel; and is given in the doſe of two ſpoonfuls, three or four times a day, in diſorders accompanied with great weakneſs and depreſſion of ſpirits.

The *expectorating* julep is formed by mixing four ounces of the emulſion of gum ammoniac with two ounces of the ſyrup of ſquills. Two table-ſpoonfuls of this julep may be taken every three or four hours in coughs, aſthmas, and obſtructions of the breaſt.

Muſk julep is made, by rubbing half a dram of muſk, and half an ounce of ſugar together, and adding gradually two ounces of ſimple cinnamon-water, and as much of peppermint-water, and alſo two drams of the volatile aromatic ſpirit. Two table-ſpoonfuls of this julep may be taken every two or three hours, in a low ſtate of nervous fevers, hiccupping, convulſions, and other ſpaſmodic affections.

The *ſaline* julep is prepared by diſſolving two drams of ſalt of tartar in three ounces of freſh lemon-juice, ſtrained; when the efferveſcence is over, add of mint-water, and common water, each two ounces, and of ſimple ſyrup one ounce. This julep removes ſickneſs at the ſtomach, relieves vomiting, promotes perſpiration, and may be of ſervice in fevers, eſpecially of the inflammatory kind.

The *vomiting* julep is made, by diſſolving four grains of emetic tartar in eight ounces of water, and adding to it half an ounce of the ſyrup of clove July-flowers. This julep may be given, in the beginning of fevers, in the doſe of one table-ſpoonful every quarter of an hour till it operates.

Julep, *Mephitic.* See Pyrmont *Water.*

JULETA, in *Geography*, a town of Sweden, in Sudermania; 35 miles N.W. of Nykioping.

JULFAR, or Dsjulfar, a town of Arabia, in the province of Oman, ſituated on a bay of the Perſian gulf; 100 miles N.W. of Oman. N. lat. 26° 3'. E. long. 57°.

JULGANOO, a town of Hindooſtan, in the Candeiſh; 46 miles E. of Burhampour.

JULGONG, a town of Hindooſtan, in the circar of Aurungabad; 15 miles S.W. of Aurungabad.

IULI, or Catkins, *Petrified*, in *Natural Hiſtory*. Small foſſil bodies are found in the chalk-pits, near the bottom of the chalk ſeries in Cherry-Hinton, in Cambridgeſhire, which Mr. Parkinſon has deſcribed in the 1ſt volume of his Organic Remains, p. 456, and conſiders them as the iuli of the larch, or ſome other tree; Dr. Parſons having conſidered them as parts of the roots of ſome plant, both of which opinions we conſider as very far from probable. Dr. Woodward, from obſerving the great accumulation of iuli, chives, or chaff of the buds of trees and plants, in the peat marſhes of our low fen lands, in his edition to the 2d part of his Natural Hiſtory of the Earth, p. 125, conſiders the ſame as an evidence that the Moſaic deluge happened in the ſpring ſeaſon, as related: not conſidering that the floods of every ſpring and ſummer ſtill bring down ſuch floating bodies in the rivers, and depoſit them on their banks and ſhores in the level parts of their courſe.

JULIA Domna, in *Biography*, ſecond wife of the emperor Severus, was a woman of great accompliſhments, a native of Emeſa, in Syria, and daughter to Baſſianus, prieſt of the ſun. In early life ſhe applied herſelf to the ſtudy of geometry and philoſophy, and became as celebrated for her mental as her perſonal charms. She came to Rome, where her learning recommended her to all the literati of the city. At twenty years of age ſhe married Severus, who, twenty years after this matrimonial connection, was inveſted with the imperial purple. Her accompliſhments made very little impreſſion upon the heart and character of her huſband, who, after a time, became ſo jealous of her, that ſhe thought it right, probably from a conſciouſneſs of guilt, and from a deſire of ſafety, to withdraw from all public affairs, and occupy her time wholly in the ſtudy of letters. She was fully ſenſible of literary merit, and invited to her court men diſtinguiſhed for literary reputation, and it was at her deſire that Philoſtratus wrote the life of Apollonius Tyanæus. Her influence, after the deceaſe of the emperor, was for a time productive of tranquillity and union between her ſons Caracalla and Geta. She oppoſed the plan of dividing the empire, but her attempts were unſucceſsful, and ſo far from being able to effect a fraternal union, ſhe was obliged to be the witneſs of the murder of her favourite ſon Geta, ſtabbed in her own arms by the order of Caracalla. It is ſaid ſhe herſelf was wounded in endeavouring to ward off the fatal blow. She ſoon recovered from her grief, by the flattering attention paid to her by Caracalla, and by his placing her name along with his own in letters to the ſenate and people. Her influence could not prevent him from practiſing thoſe follies and enormities which led to his ruin, and his death plunged her into the deepeſt affliction. Recovering from her grief, ſhe hoped to ſhare the government with Macrinus, the ſucceſſor of her ſon, and being diſappointed in this ſhe retired from court, and died in 217. It is generally admitted that ſhe ſtarved herſelf to death, but whether from the dread of Macrinus, or to free herſelf from the pains of a cancer, has not been aſcertained. She had experienced all the viciſſitudes of fortune: from an humble ſtation ſhe had been raiſed to greatneſs, only to taſte the ſuperior bitterneſs of an exalted rank. Gibbon. Univer. Hiſt.

Julia, in *Ichthyology*, a name given by Salvian and Gaza, to the *ioulos* of the Greek, called *julis* by the Latin writers in general, and by the Italians, *donzellina*. It is a ſpecies of the *Labrus*, according to Artedi, and is diſtinguiſhed by that author from the other fiſh of that kind, by the name of the variegated labrus of a palm long, and having two larger teeth in the upper jaw. See Labrus *Iulis.*

JULIAN, Flavius Claudius Julianus, in *Biography*, Roman emperor, the ſon of Julius Conſtantius, brother of Conſtantine the Great, was born at Conſtantinople in the year 331, and was ſix years of age at the time of the maſſacre of the collateral branches of the Flavian family, after the death of Conſtantine, from which only himſelf and his elder brother Gallus were ſaved. The young princes were extremely well educated; and being brought up in the Chriſtian religion, were baptized, and admitted to ſome inferior eccleſiaſtical offices. Julian publicly read the Scriptures in the church of Nicomedia. Gallus was inveſted with the imperial purple as Cæſar, in the twenty-fifth year of his age; and though he behaved with fraternal affection to Julian, his general conduct was tyrannical and diſguſting, and ſoon brought him to his end. (See Gallus.) From the time that his brother was made Cæſar, Julian was freed from every reſtraint, and put in poſſeſſion of ample patrimony. He had imbibed ſtrong prepoſſeſſions in favour of the doctrines of Paganiſm, which were foſtered by the leſſons of ſome philoſophers of the Platonic ſchool. From Maximus he received a ſecret initiation into the myſteries of the ſcience of theurgy. From his abandoning the principles in which he had been educated, he has obtained the title of "The Apoſtate." At the fatal cataſtrophe of his brother Gallus, Julian partook of this diſgrace, and was kept ſome time at the court of Milan, an object of ſuſpicion. At length he was allowed to retire to Athens, where he was confirmed in all his notions; ſo that there probably did not exiſt in the Roman empire a more ardent votary for Paganiſm than he. About the year 355, he was recalled from his ſtudious retreat to court; was declared Cæſar, and married Helena, the emperor's ſiſter. He was now employed in military enterprize, and in a ſhort time made ſeveral expeditions, in which he humbled the pride of many kings, and recovered 20,000 captives. The riſing reputation of Julian was regarded with envy and jealouſy by the emperor, who, to prevent him from becoming dangerous, deprived him of the principal part of his army. By this, Julian was reduced to great diſtreſs: he was, however, determined to ſubmit. He accordingly made his ſoldiers a ſpeech from the tribunal, exhorting them to loyalty and obedience; and gave the officers a farewel entertainment. Their reluctance to quit a commander, to whom they were ſo much attached, was augmented by this interview; and in the night, the ſoldiers encompaſſed the palace, and ſaluted Julian as the emperor. The prince ſtrenuouſly rejected the proffered honour; and by ſecuring the doors, endeavoured to exclude his perſon from their tumultuary attachment. Till the third hour of the day he remained inflexible to their prayers, their reproaches, and menaces; when being informed, that if he wiſhed to live, he muſt conſent to reign, he complied with their wiſhes. He immediately addreſſed, in his own name, and that of the army, a letter to Conſtantius, acquainting him with the event, and ſoliciting the confirmation of the dignity of Auguſtus, but ſtill acknowledging his ſupremacy as head of the empire, and offering to remain contented with the adminiſtration of the weſtern provinces of Gaul, Spain, and Britain. Conſtantins received his communication like an offended ſovereign, refuſed to admit his aſſumed title, and commanded him to return to his duty, with the rank which he formerly poſſeſſed. Julian now held him at defiance, and diſperſed manifeſtoes juſtifying his conduct; of which one of the moſt characteriſtic ſtill extant was an epiſtle to the ſenate and people of Athens, whom, as a philoſopher, a ſcholar, and a worſhipper of the gods of Greece, he ſeems to have regarded with peculiar reſpect. In his progreſs he was ſtopped by the reſiſtance of Aquileia, held by the troops of Conſtantius; and the approach of that emperor, with his veteran legions, prepared a bloody conflict, which was happily prevented by the ſudden death of Conſtantius on the confines of Cilicia. Julian, now in the thirty-ſecond year of his age, entered Conſtantinople amidſt univerſal acclamations, and was acknowledged the ſole ſovereign of the Roman empire. His elevation to ſupreme power made no alteration in his character: he was a philoſopher on the throne, as far as that title is merited by ſtrict temperance, diſregard of idle pomp, and trifling amuſements; the diligent employment of his time in active occupations, or the purſuit of mental improvement, and conſtant ſtudy to fulfil the duties of his ſtation. The ruling paſſion of Julian was to reſtore the heathen religion in all its ancient ſplendour; and to this, in various inſtances, he ſacrificed both policy and juſtice. He wrote an elaborate work againſt the truth of Chriſtianity, of which ſome fragments only have come to modern times. An edict of general toleration was his firſt meaſure, which produced the re-opening of all the heathen temples, and the return of Chriſtian ſectaries, who had been baniſhed by the late emperor. He endeavoured to render Paganiſm more reſpectable in the eyes of the public, by certain regulations for ſecuring the morals of the prieſthood. He invited to his court all the eminent philoſophers, and men of learning of that perſuaſion; and he encouraged proſelytes, by tokens of imperial favour. The reſtoration of the ancient temple of Jeruſalem attracted the ambitious mind of the emperor, who flattered himſelf that the completion of the undertaking would be at leaſt a ſpecious argument againſt the faith of prophecy, and the truth of revelation. To accompliſh it, he employed one of his ableſt generals, and ordered the governor of Paleſtine to lend his moſt ſtrenuous ſupport in reſtoring the work of Solomon to its priſtine beauty. But neither the power of an emperor, the reſources of an empire, nor the enthuſiaſm of a whole people, could effect the purpoſe. A commencement was made of this work; but the builders were interrupted by extraordinary irruptions of fire, which obliged them to abandon their undertaking. Though reſtrained either by prudence or temper from the violence of perſecution, Julian ſyſtematically purſued meaſures calculated to degrade and depreſs the Chriſtians. He treated them with the language of ſarcaſtic contempt, deprived them of the management of charitable contributions, and levelled all the honours of ſacerdotal rank. He forbade all Chriſtians from acting as teachers of grammar and rhetoric, or the liberal arts; thus compelling their youth to remain uneducated, or to receive, with the rudiments of learning, impreſſions ſubverſive of their faith. He excluded them from poſts of truſt and honour; and condemned them to make ample amends for the deſtruction of Pagan temples in the preceding reigns, and reſtitution of lands and revenues, which had been converted to the uſe of their own religion. The love of military glory was another paſſion by which Julian was actuated; and the field which he thought moſt worthy of its indulgence was the Perſian empire, long the rival and formidable foe of the Roman. When he croſſed the Tigris, he burned his ſhips, that his ſoldiers might proceed with firmneſs and reſolution. He defeated the Perſians drawn up to oppoſe him, and puſhed on to the gates of the capital. Miſled by treacherous guides, he was preſently reduced to a ſcarcity of proviſions; and he found that the only means of ſafety for his army conſiſted in retreat. In the mean time, the whole force of the Perſian empire was aſſembled, and clouds of light troops haraſſed the Romans on every ſide, while the main body of the Perſian hoſt advanced in formidable array. Julian performed every duty of a ſoldier and a general, partook in every fatigue and hardſhip, and was preſent wherever danger was moſt urgent. The attacks of the enemy were ſeveral times repelled: at length Julian was mortally wounded, fell ſenſeleſs from his horſe, and was conveyed from the field in a ſtate which announced approaching death. Senſible of his ſituation, he pronounced a farewel ſpeech to the ſurrounding officers, and directed the diſpoſal of his private property; after which, he entered into a metaphyſical diſcuſſion with regard to the nature of the ſoul. Exhauſted by theſe efforts, he called for a draught of cold water; and as ſoon as he had ſwallowed it, calmly expired, on June 26th, 363. The character of no eminent perſon has been more differently repreſented by friends and enemies. Of his writings, which are compoſed in the purity of the Greek language, one of the moſt curious is entitled "The Cæſars," which, in the form of a fable, freely diſcuſſes the characters of the ſeveral emperors, his predeceſſors. He gives the decided preference to Marcus Antoninus, whom he made his model in his religious and philoſophical quality, although in temper he was a very different man. The learned Spanheim gave an elaborate edition of his works in Greek and Latin, in folio, 1696. Julian's partiality for every thing Grecian had infuſed into his mind a love of liberty, and a ſenſe of the natural equality of mankind; and he rejected with abhorrence the haughty title of "Lord," which the Romans had introduced in addreſſing the maſter of the empire. He alſo imitated the beſt of the emperors, in paying reſpect to the conſular dignity, and obedience to the laws of the ſtate. He frequently ſat upon the bench as judge, and adminiſtered juſtice with great impartiality between the rich and the poor. He poſſeſſed ſound ideas of legiſlation; and it is to the credit of his character, that, of the laws enacted during his ſhort reign, fifty-four have been received into the codes of Theodoſius and Juſtinian. Univer. Hiſt. Gibbon's Rom. Hiſt. vol iii. and iv.

The moſt ancient proof of an inſtrument, reſembling a modern organ, blown by bellows, and played with keys, very different from the hydraulicon, which is of much higher antiquity, is a Greek epigram in the Anthologia, attributed to the emperor Julian, who flouriſhed about 364. We ſhall here give a literal tranſlation of this epigram, which, though it contain no very beautiful or poetical images, will anſwer the hiſtorical purpoſe of aſcertaining the exiſtence of an inſtrument in the fourth century, which, in many particulars, reſembled a modern organ.

We ſhall inſert the original here, for the ſatisfaction of the learned reader, from the Anthol. lib. i. cap. 86. 8.

Αλλοίην ὁρέω δονάκων φύσιν· ἦπου ἀπ' ἄλλης
Χαλκείης τάχα μᾶλλον ἀνεβλάστησαν ἀρούρης,
Αγριοι, οὐδ' ἀνέμοισιν ὑφ' ἡμετέροις δονέονται,
Αλλ ὑπο ταυρείης προθορὼν σπήλυγγος ἀήτης,

Νέρθεν ἐϋτρήτων καλάμων ὑπὸ ῥίζαν ὁδεύει.
Καί τις ἀνὴρ ἀγέρωχος ἔχων θοὰ δάκτυλα χειρὸς,
Ισταται ἀμφαφόων κανόνας συμφράδμονας αὐλῶν·
Οἱ δ' ἀπαλὸν σκιρτῶντες, ἀποθλίβουσιν ἀοιδήν.

"I ſee reeds of a new ſpecies, the growth of another and a brazen ſoil; ſuch as are not agitated by our winds, but by a blaſt that ruſhes from a leathern cavern beneath their roots; while a *robuſt* mortal, (ἀγέρωχος, a tall ſturdy fellow, alluding to the force neceſſary to beat down that kind of clumſy *carillon* keys of this rude inſtrument of new invention,) running with ſwift fingers over the concordant keys, (the rulers of the pipes, αυλων; literally *keys*,) makes them, as they ſmoothly dance, emit melodious ſounds."

Nothing material is omitted in the verſion of this epigram, or rather enigma, upon the organ, though not a very ingenious one; for the word αὐλων, the *pipes*, diſcovers the whole myſtery.

JULIAN *Calendar*, *Epocha*, and *Period*. See the ſubſtantives.

JULIAN *Law*. See PAPIAN POPÆAN *law*.

JULIAN *Year*. The Julian is the old account of the year, uſed among us in England till 1752. It is ſo called from its founder Julius Cæſar; and by that name is diſtinguiſhed from the new, or Gregorian account, uſed in moſt parts of Europe. See YEAR.

JULIANS, in *Botany*. See *Dame's* VIOLET.

JULIEN, SAINT, *des Meneſtriers*, in *Biography*. M. Millot, in his Hiſtory of the Troubadours, tells us, that William IX. count of Poitou, in one of his poems, after relating a particular adventure with a common woman in very free terms, and reflecting upon his *bonnes fortunes*, or favour with the ladies, thanks God and St. Julien for his ſucceſs. "It was then," ſays M. Millot, "cuſtomary, ſuch was the ſuperſtition of the times, for libertines to invoke heaven for ſucceſs in their moſt profligate undertakings; and St. Julien was the particular ſaint and protector to whom they addreſſed themſelves upon ſuch occaſions:" as, in higher antiquity, Mercury was the patron divinity of thieves.

This ſaint, in order to expiate an involuntary crime, is ſaid to have made a vow that he would receive into his houſe all paſſengers who ſhould be in want of a habitation, by which he obtained the title of the "Hoſpitable Saint," and was afterwards addreſſed as the patron of travellers, to whom prayers were made for a good lodging. "L'Oraiſon de St. Julien, et l'Hôtel de St. Julien," were afterwards uſed by the French in pleaſantry, much in the ſame ſenſe as with us, *dining with duke Humphrey*. But in the tales written in old French ſo early as the twelfth century, the alluſion was more licentious. Boccace (Giorn. II. nov. 2.) ſpeaks of the "Paternoſtro di San Giuliano," and makes Rinaldo, after a ſucceſsful adventure with a female, return thanks to God and St. Julien: "Per la qual coſa Rinaldo Iddio, et San Giuliano ringraziando, montò a Cavallo." La Fontaine, who has tranſlated this tale, calls it "L'Oraiſon de St. Julien."

JULIEN, *St.*, in *Geography*, a town of France, in the department of the Jura, and chief place of a canton, in the diſtrict of Lons-le-Saulneir; 18 miles S. of Lons-le-Saulneir. The place contains 899, and the canton 7098 inhabitants, on a territory of 120 kiliometres, in 29 communes.—Alſo, a town of France, in the department of the Côte d'Or; nine miles N.N.E. of Dijon.—Alſo, a town of France, in the department of the Leman, and chief place of a canton, in the diſtrict of Geneva; five miles S.W. of Geneva. The place contains 750, and the canton 11,071 inhabitants, on a territory of 197½ kiliometres, in 24 communes.—Alſo, a town of France, in the department of the Rhône and Loire; 13 miles E.S.E. of St. Etienne.

JULIEN'S, *St.*, *Bay*, a large bay, containing a port, on the coaſt of Patagonia. S. lat. 49° 8'. W. long. 67° 43' 30".

JULIEN *en Champſeur*, *St.*, a town of France, in the department of the Higher Alps; ſix miles N. of Gap.

JULIEN *de Chapteuil*, *St.*, a town of France, in the department of the Upper Loire, and chief place of a canton, in the diſtrict of Le Puy; ſeven miles E. of Le Puy. The place contains 2151, and the canton 7448 inhabitants, on a territory of 152½ kiliometres, in 7 communes.

JULIEN *l'Ars*, *St.*, a town of France, in the department of the Vienne, and chief place of a canton, in the diſtrict of Poictiers; ſix miles E. of Poictiers. The place contains 281, and the canton 4997 inhabitants, on a territory of 207½ kiliometres, in 13 communes.

JULIEN *de Montagnier*, *St.*, a town of France, in the department of the Var; nine miles N.W. of Barjols.

JULIEN *de Vouvantes*, *St.*, a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Chateaubriant; ſeven miles S.S.E. of Chateaubriant. The place contains 1401, and the canton 5676 inhabitants, on a territory of 212½ kiliometres, in 5 communes.

JULIEN *du Sault*, *St.*, a town of France, in the department of the Yonne; ſix miles N.W. of Joigny.

JULIERS, *Duchy of*, lately a country of Germany, but now annexed to France, and forming a part of the department of the Roer. This duchy was formerly bounded on the N. by the duchy of Gueldres, on the E. by the electorate of Cologne and the Rhine, on the S. by the territories of Blankenheim and Schleiden, and on the W. by the biſhopric of Liege, the duchy of Gueldres, and the Meuſe. The ſoil is fertile, producing corn in abundance, and yielding good meadow and paſture land; it furniſhes a good breed of cattle and of horſes. Wood is plentiful, and linen is manufactured. Near Eſchweiler ſtone-coal is found. In this duchy are 26 towns, and about 11 free boroughs. See ROER.

JULIERS, a town of France, in the department of the Roer, and chief place of a canton, in the diſtrict of Cologne, ſituated on the Ruhr. It is ſaid to have received its name from the Romans. The town is ſmall but ſtrong, and has a regular citadel. It has a church and a convent, and without the walls are a Calviniſt and a Lutheran church. The place contains 2126, and the canton 12,639 inhabitants, in 28 communes. This town ſurrendered at diſcretion to the French troops in October 1794, after a ſevere battle between the Auſtrians and French. N. lat. 50° 54'. E. long. 6° 18'.

JULIFUNDA, a town of Africa, in the country of Dentila; 10 miles W. of Baniſerile.

JULIO, a mountain of the Griſons, N. of the Upper Engadine; eight miles S.W. of Zulz.

IULIS, in *Ichthyology*, the name of a ſmall fiſh, a ſpecies of the labrus, caught principally about Genoa, and ſold in the markets, being a very delicately taſted fiſh. Its uſual ſize is about the length, and a little more than the breadth of a finger. The males of this ſpecies are very beautifully painted. Their backs are green, and their heads have variegations of yellow and red. Its ſides have very broad ſerrated lines of a fine gold yellow, and its back fin has ſeveral large ſpots of blue and red. They are fond of human blood, and will ſeize upon the legs of people who walk naked into the water. See LABRUS *Iulis*.

JULIUS I. in *Biography*, pope, was a Roman by birth, and ſucceeded to the papal ſee on the death of Mark, in the year 337. At this period the celebrated Athanaſius lived in a ſtate of exile at Treves, but in the following year he was permitted to return to Alexandria by the emperors Conſtantine, Conſtantius, and Conſtans. This circumſtance excited the alarm of the Arian party, who, at a council aſſembled at Antioch, got Athanaſius depoſed, and Gregory, biſhop of Alexandria, appointed in his ſtead. But in the Roman council, Athanaſius was pronounced innocent of the crimes alleged againſt him, and was admitted by Julius to his communion, as an orthodox pillar of the church. The orthodox party confirmed the acts of the council of Rome, and, in the height of their zeal, they introduced for the firſt time, and authorized the practice of appealing to the pope, in conteſted eccleſiaſtical concerns, of which the ſucceſſors of Julius availed themſelves in eſtabliſhing the enormous ſpiritual tyranny, which, by degrees, they erected in the church. Julius died in 352, having ſat upon the pontifical throne ſomewhat more than fifteen years. Two of the letters of this pope are extant, one addreſſed to the Oriental biſhops, and the other to the people of Alexandria in favour of Athanaſius.

JULIUS II. pope, formerly known by the name of "Julian della Rovere," nephew of pope Sixtus IV., was born in the year 1443. He is ſaid to have been of very mean extraction, and to have followed for ſome time the occupation of a waterman; he was preferred by his uncle Sixtus to the ſee of Carpentras, and raiſed to the purple in the year 1471. By the ſame pope he was raiſed ſucceſſively to other valuable biſhoprics, and upon the breaking out of an inſurrection in Ombria, his uncle gave him the command of the papal troops, which was an employment perfectly adapted to his genius. He put an end to the rebellion which gave him vaſt influence and power at Rome. In 1480 he took an active part in the elevation of Innocent VIII. to the papacy, and while that pontiff lived he was in high favour at the papal court; but during the popedom of his ſucceſſor Alexander VI., thinking his life in danger, he retired into France, and attended king Charles in his expedition againſt Naples. In 1503 he was himſelf elected pope, in the ſtead of Pius III. who had held the ſacred office only twenty-ſix days. He took the name of Julius II., and, being poſſeſſed of a bold and martial ſpirit, determined to extend the temporal empire of the church by the force of arms. The emperor Maximilian, with the kings of France and Arragon, endeavoured to depoſe him, but he fruſtrated their deſigns, and in the year 1508 the famous league of Cambray againſt the republic of Venice was concluded between the pope, the emperor, the king of France, and the king of Spain, which threatened the entire ruin of that ſtate. Before Julius ſigned this league, his unwillingneſs to increaſe the power of either the emperor, or the French king in Italy, induced him privately to communicate the terms of it to the Venetian ambaſſador, at the ſame time offering not to confirm it, provided that the republic reſtored to him the cities of Rimini and Faenza. This propoſal was moſt unwiſely rejected by the Venetian ſenate, and Julius confirmed the league. The Venetians were wholly unable to withſtand ſuch powerful enemies, and being reduced to the greateſt extremities, they were obliged to ſubmit. The pope abſolved them from the effects of the ſentence of excommunication iſſued againſt them, and without heſitation granted leave to all the ſubjects of the church to ſerve under their banners. He now formed the deſign of driving the French out of Italy, and with this view he laid ſiege to Mirandola, which he entered in triumph in 1511, but fortune turning againſt him, he was driven to Rome. In the courſe of his journey he received the unwelcome intelligence, that an order for the aſſembling of a general council at Piſa was poſted up at Modena, Bologna, and other cities in Italy, and that himſelf was ſummoned to appear at it in perſon. To counteract their proceedings, of which he had reaſon to entertain apprehenſions, the pope ſummoned a general council to meet the following year at Rome, pretending, by that meaſure, to have ſuperſeded the council convoked at Piſa. An end, however, was not put to the ſeſſions of this council before a decree had been paſſed declaring pope Julius II. a diſturber of the public peace, a ſower of diſcord among the people of God, a rebel to the church, a public incendiary, a blood thirſty tyrant, and as ſuch ſuſpended from all ſpiritual and temporal adminiſtration of the church, and forbidding the faithful thenceforth to acknowledge or obey him. In revenge, Julius excommunicated the king of France, laid his kingdom under an interdict, and abſolved his ſubjects from their oath of allegiance. In May 1512 the council met at Rome, in oppoſition to that of Piſa, but during the fifth ſeſſion, the pope was ſeized with an illneſs which proved fatal to him in Feb. 1513, at the age of ſeventy, and after a pontificate of between nine and ten years. Julius was a perſon of great abilities, courage, and reſolution, but arrogant and of inſatiable ambition; poſſeſſing the moſt extravagant paſſion for war and bloodſhed; ſo that it was ſaid of him, if he wanted the qualities of a good biſhop, he had at leaſt thoſe of a conquering prince. He has been accuſed of every crime, but his faults have been probably much exaggerated. He was much leſs chargeable with nepotiſm than many preceding popes; for of the twenty-ſeven cardinals created by him, four only were in any degree related to him, and theſe were men of unblemiſhed characters. He was an encourager of the arts of painting, ſculpture, and architecture, and begun the erection of the magnificent church of St. Peter.

JULIUS III. pope, formerly known by the name of John-Maria del Monte, was a perſon of mean extraction, and born in Rome about the year 1488. His uncle Anthony del Monte was made a cardinal by pope Julius II., and thus had the means of raiſing his family from obſcurity. Under his patronage John-Maria was educated for the church, and diſtinguiſhed himſelf by his proficiency in literature and juriſprudence. By his uncle's influence he obtained an archbiſhopric, and afterwards filled various poſts under the holy ſee. In 1536 he was created a cardinal by pope Paul III. who afterwards employed him on different legations. He acquitted himſelf ſo well in theſe employments, that he obtained the character of a perſon of vaſt application and uncommon abilities, and he recommended himſelf ſo powerfully to his holineſs, that in the year 1545 he appointed him his principal legate in the council of Trent, and confided to him his moſt ſecret intentions. In February 1550 he was elected to the popedom, and took the name of pope Julius III. out of reſpect to the memory of the pontiff, who, by raiſing his uncle to the cardinalſhip, had laid the foundation of his good fortune. One of his firſt acts gave great offence to every decent perſon; he conferred a cardinal's hat, with ample eccleſiaſtical revenues, upon a youth of ſixteen, born of obſcure parents, and known by the name of Ape, from his having been entruſted with the care of an animal of that ſpecies, in the cardinal del Monte's family. Such an indecent promotion was regarded by the cardinals as a groſs affront offered to their body, but when they reproached him for introducing ſuch an unworthy member into the ſacred college, who had neither learning nor virtue, nor merit of any kind: he aſked them "what virtue or merit they had found in him, that could induce them to place him in the papal

papal chair?" The ſubſequent conduct of Julius correſponded with this ſhameleſs behaviour at the commencement of his pontificate. He gave himſelf up to the unreſtrained indulgence of his deſires, and ſpent his whole time, and the revenues of the church in amuſements, diſſipation, and licentiouſneſs of every kind. He died in 1555, having held the papal ſee about five years. Moreri. Bower. Bayle.

JULKADDER, in *Geography*, a town of Hindooſtan, in Bengal; 27 miles S. of Iſlamabad.

JULKANPOUR, a town of Hindooſtan, in Guzerat; 50 miles N.W. of Amedabad.

JULLOMA, a town of Peru, in the dioceſe of La Paz; 50 miles S.W. of La Paz.

JULSIO, a town of Sweden, in Weſtmanland; 52 miles N.W. of Stroemſholm.

JULTOWKOW, a town of Poland, in the palatinate of Braclaw; 5½ miles W.N.W. of Braclaw.

IULUS, in *Antiquity*. See IULE.

IULUS, in *Botany*, an old name for the *amentum*, or catkin, of Linnæus; but the word being now appropriated to a genus of inſects, is laid aſide by botaniſts.

IULUS, in *Entomology*, a genus of aptera, with the lip crenated and emarginated; feelers two, and filiform; body long, ſemi-cylindrical, and conſiſting of numerous tranſverſe ſegments; legs numerous, being two on each ſide of every ſegment of the body. This is the definition of the genus, according to the Gmelinian ſyſtem. Fabricius, to whom we are indebted for our knowledge of ſeveral new ſpecies, diſtinguiſhes it merely by the lip and antennæ; the firſt of which, he obſerves, is crenated and emarginate, and the latter moniliform: in addition to theſe peculiarities, the ſtructure of the body, legs, &c. conſtitute a ſecondary character. The ſpecies are chiefly aſcertained by the number of the legs.

Species.

OVATUS. Legs each ſide twenty. Linn. *Oniſcus*, Gronov.

Inhabits the ſeas of Europe.

COMPLANATUS. Legs each ſide thirty; body flattiſh; tail pointed. Fabr. *Iulus complanatus*, Linn., Degeer, &c. *Scolopendra Iulacea*, Scop. *Iulus ſcolopendricus*, Pod. Muſ.

Native of Europe. Linnæus deſcribes the antennæ of this inſect as being clavated, which is the caſe, though ſlightly.

DEPRESSUS. Legs each ſide thirty; body flattiſh; tail rounded and entire. Fabr.

An Indian ſpecies of very large ſize, the head of which is brown, and the ſegments rough, grey, and prominent, each ſide. Lund.

STIGMA. Legs thirty each ſide; body black, with a white dot each ſide on every alternate ſegment. Fabr.

Found at Tranquebar by Dr. Koenig. Its ſize is twice that of Iulus complanatus; the antennæ and legs are black; tail pointed and white.

TRIDENTATUS. Legs each ſide thirty-ſix; tail armed with three teeth. Fabr.

An American ſpecies, in the cabinet of Drury. The eighteen ſegments of the body grey, and each marked with a ferruginous dorſal dot; legs with two denticles at the baſe.

VARIUS. Legs ſeventy-eight each ſide; ſegments of the body black at the baſe, and white at the tip. Fabr.

A ſpecies of moderate ſize, which inhabits Italy. The head is black, with a white band in the middle; ſegments whitiſh, and having a fine or thin ferruginous margin; legs black.

CRASSUS. Legs each ſide eighty. Linn.

Native of Aſia. Pale, with a line of minute black dots each ſide; tail acute.

TERRESTRIS. Legs each ſide one hundred. Linn. *Iulus faſciatus*, Degeer.

Inhabits Europe. Don. Br. Inſ.

CARNIFEX. Legs each ſide ninety-four; head and legs red; tail with a red line. Fabr.

Native of Tranquebar.

INDUS. Legs each ſide one hundred and fifteen. Linn.

Inhabits India.

SABULOSUS. Legs each ſide one hundred and twenty. Linn. *Iulo glabro*, &c. Ray.

Found on the nut in Europe.

FUSCUS. Legs each ſide one hundred and twenty-four. Linn.

An inhabitant of India.

MAXIMUS. Legs each ſide one hundred and thirty-four. Linn.

A large ſpecies found in South America.

IULUS, in *Ichthyology*, a ſpecies of *Cyprinus*; which ſee.

JULY, in *Chronology*, the ſeventh month of the year, during which the ſun enters the ſign Leo. The word is derived from the Latin *Julius*, the ſurname of C. Cæſar the dictator, who was born in it. Mark Antony firſt gave this month the name July, which was before called *Quintilis*, as being the fifth month of the year, in the old Roman calendar eſtabliſhed by Romulus, which began in the month of March. For the ſame reaſon, Auguſt was called *Sextilis*; and September, October, November, and December, ſtill retain the name of their firſt rank.

"Quæ ſequitur, numero turba notata ſuo."

On the third day of this month the dog days are commonly ſuppoſed to begin, and to end on the eleventh day of Auguſt. See CANICULAR *Days*

JULY *Flowers*, or *Gillyflowers*, in *Botany*. See PINK.

JULY *Flower*, *Clove*. See DIANTHUS and PINK.

JULY, *Queen's*, *Flower*. See *Dame's* VIOLET.

JULY, *Stock*, *Flower*. See STOCK, &c.

JUMANAH, in *Geography*, a river of Bengal, which runs into the bay, N. lat. 21° 34'. E. long. 88° 38'.

JUMANDAR, a town of Aſiatic Turkey, in Natolia; 24 miles E.S.E. of Degnizlu.

JUMBO, a town of Africa, in the kingdom of Kaſſon; 5 miles N.W. of Kooniakary.

JUMBOOAH, a town of Hindooſtan, in Guzerat; 5 miles S. of Broderah.

JUMCUNDY, a town of Hindooſtan, in Viſiapour; 11 miles W. of Galgala.

JUMDAY, a town of Bengal; 30 miles S. of Boglipour.

JUMEAUX, a town of France, in the department of Puy-de-Dôme, and chief place of a canton, in the diſtrict of Iſſoire. The place contains 1106, and the canton 7525 inhabitants, on a territory of 122½ kiliometres, in 10 communes.

JUMETTAS, or YUMETTAS *Keys*, a range of rocks or iſlets among the Bahamas, extending from the S.W. coaſt of the iſland of Yuma. N. lat. 22° 40'. W. long. 76°.

JUMGERBAD, a town of Hindooſtan; 30 miles W. of Benares.

JUMILAMURKA, a town of Hindooſtan, in the Carnatic; 25 miles N.N.W. of Ongola.

JUMILLA, a town of Spain, in the province of Murcia; 22 miles S.W of Murcia. The town is ſmall, but contains about 8000 inhabitants. It is ſituated at the entrance of a large and magnificent valley, at the foot of the mountain on which its old caſtle ſtands. The ſtreets are ſtraight, long, and large, but unpaved; the houſes are clean, though not ſplendid. It has an hoſpital under the title of the Holy Ghoſt, a convent of Franciſcan monks, and two pariſh churches.

JUMILLAC, Le Grand, a town of France, in the department of the Dordogne, and chief place of a canton, in the diſtrict of Nontron; 9 miles N. of Exideuil. The place contains 2424, and the canton 8056 inhabitants, on a territory of 215 kiliometres, in 7 communes.

JUMMANEAH, a town of Hindooſtan, in Candeiſh; 10 miles N.E. of Peploud.

JUMMEEDY, a town of Bengal; 24 miles S. of Ghidore.

JUMMOO, Jumbo, or *Jumbhu*, a town of Hindooſtan, and capital of a diſtrict in Lahore, to which it gives name. It is diſtant 42 coſſes from Biſſooly, and 50 about N. by E. from Lahore. It is ſituated on the ſide of a hill, near the river Rauvee, and divided into Upper and Lower Towns. This place is a mart of conſiderable conſequence. Various circumſtances concurred to divert the trade of Cachemire or Caſhmere to Jummoo, and thus to render it a place of extenſive commercial reſort, where perſons of all deſcriptions, under the protection and encouragement of its chief, experienced in their perſons and property full ſecurity. The commodities, conſtituting the trade of Jummoo and Caſhmere, are tranſported by men, uſually Cachemirians, whoſe burdens are heavy, two of them making the load of a mule, and the hire is fixed at the rate of four rupees for each carrier. The ſhawls, when exported from Cachemire, are packed in an oblong bale, containing a certain weight or quantity, which, in the language of the country, is termed a "bidding," encloſed in an ox's or buffalo's hide, and carried by the Cachemirian as a Scotchman carries his pack.

In 1770, the period of Runzeid Deve's death, Jummoo ſuſtained a grievous loſs; for one of his ſons ſeized the government, put to death one of his brothers, who was intended by the father for his ſucceſſor, and impriſoned another. The Seiks embraced this opportunity of invading Jumbo, from which they had before exacted a moderate tribute. The moſt valuable diviſion of the Jumboo diſtricts lay in the plain country, and formed a part of the Panjab. Theſe were laid waſte by the Seiks, under a pretence of giving aſſiſtance to the fugitive chief, who recurred to them for protection. N. lat. 33°. E. long. 74° 5'.

JUMMUCANDY, a town of Bengal, 20 miles S.W. of Moorſhedabad. N. lat. 23° 56'. E. long. 88° 13'.

JUMNAH, a river of Hindooſtan, which riſes in Thibet, and paſſing by Delhi, runs into the Ganges at Allahabad.

JUMNEE, a town of Bengal; 20 miles W. of Noony.

JUMOTTO, a town of Japan, in the iſland of Ximo; 12 miles S.E. of Nangaſaki.

JUMP, in *Mining*, is one among the very numerous appellations, which the diſlocations of the ſtrata have received from the practical miners of different diſtricts. See our article Fault.

JUMPER is the name for a long iron tool, with a ſteeled chiſſel-like point, which they uſe in quarries and mines, for drilling, or boring ſhot-holes in rocks, which require to be blaſted with gunpowder. Drill, neger, and gad, are other terms for this tool.

JUMUNDERAD, in *Geography*, a town of Sweden, in the province of Angermanland; 24 miles N. of Hernoſand.

JUNAGUR, or Chunagur, a city and fortreſs of Hindooſtan, in Guzerat; 170 miles S.W. of Amedabad. N. lat. 24° 50'. E. long. 69° 54'.

JUNASKA, one of the Fox iſlands, in the Pacific ocean. N. lat. 53° 26'. E. long. 189° 14'.

JUNAT, a town of Bengal; 13 miles N.E. of Rogonatpour.

JUNCAGO, in *Botany*, Tourn. Inſt. t. 142, ſo called from its reſemblance to a *juncus*, or ruſh. See Triglochin, Arrow-headed graſs.

JUNCAL, in *Geography*, a ſea-port of South America, in the country of Chili, ſituated on the coaſt of the Pacific ocean; 50 miles N. of Copiapo.

JUNCALAS, a town of France, in the department of the Upper Pyrenees, and chief place of a canton, in the diſtrict of Argelès; 12 miles S. of Tarbes. The place contains 400, and the canton 4572 inhabitants, on a territory of 102½ kiliometres, in 18 communes.

JUNCAW, a town of Hindooſtan, in the circar of Mohurſunge; 25 miles N. of Harriorpour.

JUNCEÆ, in *Botany*, Brown Prodr. Nov. Holl. v. 1. 257. See below.

JUNCI, the 13th natural order of plants in Juſſieu's ſyſtem, or the third of his third claſs. It is named from one of its principal, or leading genera, *Juncus*, the Ruſh, properly ſo called.

Juſſieu's third claſs comprehends monocotyledonous plants whoſe ſtamens are inſerted into the calyx or corolla. His definition of the preſent order is as follows.

Calyx (which, in ſome of the genera, we ſhould, with Linnæus, term *corolla*) inferior, in ſix deep ſegments, (rather of ſix leaves,) either equal or unequal, the three alternate ones, in the latter caſe, being larger, and petal-like, or it is glumaceous, and akin to the huſks of graſſes. *Stamens* definite (except in *Sagittaria* and perhaps *Aliſma*), moſtly ſix, rarely three or nine, inſerted into the lower part of the calyx. *Germen* ſuperior, in ſome ſimple, with a ſingle ſtyle; the ſtigma ſimple or divided; capſule of three cells and three valves; with many ſeeds, inſerted into the partitions originating from the centre of each valve. In others the germens, ſtill ſuperior, are three or ſix, rarely indefinite, ſometimes united at their baſe; ſtyles and ſtigmas equal to them in number, as well as the capſules, which are ſingle-celled, either diſtinct or united, either ſingle-ſeeded and often not burſting, or many-ſeeded, ſeparating into two valves at their inner edge, the margins of the valves, (or the partitions) bearing the ſeeds. Corculum (perhaps of all) in the ſcar of a horny albumen. Plants herbaceous. The radical leaves, as well as thoſe on the lower part of the ſtem, alternate and ſheathing; the upper and floral leaves often aſſuming the form of a ſpatha, and ſeſſile. Flowers furniſhed with ſpathas.

The ſections are four.

1. Germen ſolitary. Capſule of three cells. Calyx glumaceous.—This compriſes five genera, all Linnæan, *Eriocaulon*, *Reſtio*, *Xyris*, *Aphyllanthes*, and *Juncus*, the laſt only properly anſwering to the character.

2. Germen ſolitary. Capſule of three cells. Calyx half petal-like.—Here are ſix genera, *Mnaſium* of Schreber (which is *Rapatea* of Aublet), *Syena* of Schreber (Aublet's *Mayaca*), *Pollia* of Thunberg, *Calliſia*, *Commelina*, and *Tradeſcantia* of Linnæus.

3. Germens ſeveral. Capſules as many, ſingle-celled. Flower-ſtalks radical, umbellate or whorled, the umbels and whorls encompaſſed with a three-leaved involucrum. Plants aquatic.—The genera are *Butomus*, *Damaſonium*, *Aliſma*, and *Sagittaria*.

4. Germens ſeveral (moſtly three). Capſules as many, ſingle-celled, ſometimes united at their baſe. Flowers pani-

cled or ſpiked.—Here we find *Nectris* of Schreber (*Cabomba* of Aublet), *Scheuchzeria*, *Triglochin*, *Narthecium* (*Tofieldia* of Hudſon and Smith), *Helonias*, *Melanthium*, *Veratrum*, and *Colchicum*.

This, nearly analogous to the *Tripetaloideæ* of Linnæus, is perhaps, on the whole, one of the leaſt correct of Juſſieu's orders. The order of *Junceæ*, extracted from it by *Decandolle* and *Brown*, is much better defined, in conſequence of the expulſion of *Reſtio* and its allies on the one hand, and *Commelina*, &c. on the other, with the removal of other genera to their proper places.

Junci *Lapidei*, in *Natural Hiſtory*, the name given by authors to a ſpecies of foſſile coral, of the tubularia kind, and compoſed of a congeries of ſmall tubules, which are uſually round and ſtriated within.

JUNCKER, Gottlob John, in *Biography*, a learned phyſician, was born on the 3d of June, 1680, at Londorff, near Gieſſen, in Heſſe. He purſued his medical ſtudies at Marpurg and Erfurt, and afterwards took the degree of M.D. at Halle, in the year 1718. He became ſubſequently a diſtinguiſhed profeſſor in this univerſity, and attained a high reputation as phyſician to the public hoſpital. He died at Halle, on the 25th of October, 1759. His works, which are chiefly compilations, have been much eſteemed, and are ſtill occaſionally referred to, eſpecially as they contain the beſt and moſt compendious view of the doctrines of Stahl, which he eſpouſed and taught. They are as follows: 1. "Conſpectus Medicinæ Theoretico-practicæ, Tabulis 137 primarios morbos, methodo Stahlianâ tractandos, exhibens," Halle, 1718, 4to.; – 2. "Conſpectus Chirurgiæ, &c." *ibid.* 1721, 4to.;—3. "Conſpectus Formularum Medicarum, &c." *ibid.* 1723, 4to.;—4. "Conſpectus Therapeiæ generalis, &c. Tabulis 20 methodo Stahlianâ conſcriptus," *ibid.* 1725, 4to.;—5. "Conſpectus Chemiæ Theoretico-practicæ in formâ Tabularum Repræſentatus, &c. Tomus prior." *ibid.* 1730, 4to. This is an elementary work on chemiſtry, according to the principles of Becher and Stahl.—6. "Conſpectus Phyſiologiæ," *ibid.* 1735, 4to.;—and 7. "Conſpectus Pathologiæ," *ibid.* 1736, 4to. Juncker likewiſe publiſhed many academical theſes on medical, chirurgical, and philoſophical ſubjects. Eloy. Dict. Hiſt.—Gen. Biog.

JUNCO, in *Geography*, a river of Africa, which croſſes the Grain Coaſt, and runs into the Atlantic; 90 miles E.S.E. of Cape Monte.

Junco, in *Ornithology*, the reed ſparrow. See Emberiza *Schoeniculus*.

Junco is alſo uſed by Bellonius for a bird, ſeeming, by his deſcription, the ſame with what we call the ſtint. See Tringa *Cinelus*.

JUNCTIN, Francis, in *Biography*, a mathematician of Florence, who flouriſhed in the ſixteenth century, and was for a time a Carmelite, but quitted his order, and going to France, abjured the Roman Catholic religion. He became a corrector of the preſs, and afterwards a manufacturer of paper, and a banker, by which avocations he gained a large fortune. He died about the year 1580. He was author of ſome arithmetical works, commentaries on the ſphere of Sacroboſco, on the Reformation of the Calendar, and on the age of the Loves of Petrarch.

JUNCTIONS. Among the Hindoos, junctions or meetings of many things are deemed holy and myſterious; more eſpecially the junctions of rivers. The junction of the day with night, the forenoon with the afternoon, &c. are duly reverenced, by ſtrict obſervers, with appropriate prayers and ceremonies; but the junction of rivers, above all, are very myſteriouſly contemplated. An act performed there, be it ever ſo good, is rendered vaſtly more ſo by this holy locality. Widows who burn themſelves with their huſbands' corpſe, always do it, where practicable, at the junction of two rivers: this horrid ſacrifice is called *Sati*, which ſee. As well as this ſpecies of meritorious ſuicide the Hindoos recognize ſome others, and if performed at the confluence of rivers the merit of the act is greatly enhanced.

"One of the holieſt ſpots of the Ganga (or Ganges) is where it joins the Yamuna (Jumna) below Delhi. A third ſacred river, the Saraſwati, is ſuppoſed to join them ſubterraneouſly, whence the junction is called *Triveni*, or the *three plaited locks*. Pilgrims here begin the ceremonies afterwards completed at Gàya. The confluence of rivers is a ſpot peculiarly dear to Hindoos; and this, more eſpecially of the Ganga and Yamuna, is ſo highly eſteemed, that a perſon dying there is confident of immediate beatitude, without riſk of farther tranſmigration Suicide is not only pardonable, but in ſome caſes meritorious with Hindoos. Cutting one's throat at the above holy junction, is, in reference to its immediate reſult, an inſtance of the latter. (See Suicide.) Widows who become *ſati*, or *pure*, by burning themſelves with the bodies of their deceaſed huſbands, which is generally done at the *ſangam*, or confluence of rivers, perform an act of meritorious ſuicide. And all acts in themſelves good, are rendered vaſtly better if done on ſuch a ſpot." Moor's Hindoo Pantheon.

JUNCTURE, any joint, or cloſing, of two bodies. See Joint.

Juncture, in *Oratory*, is a part of compoſition, particularly recommended by Quintilian, and denotes ſuch an attention to the nature of the vowels, conſonants, and ſyllables in the connection of words, with regard to their ſound, as will render the pronunciation moſt eaſy and pleaſant, and beſt promote the harmony of the ſentence. Thus the coalition of two vowels, occaſioning an hollow and obſcure ſound, and likewiſe of ſome conſonants rendering it harſh and rough, ſhould be avoided; nor ſhould the ſame ſyllable be repeated at the beginning and end of words, becauſe the ſound becomes hereby harſh and unpleaſant. The following verſe in Virgil's Æneid is an example of juncture:

> "Arma Virumque cano, Troja qui primus ab oris."

JUNCULAM, in *Geography*, a town of the iſland of Java, on the S.W. coaſt; 55 miles S.S.W. of Batavia. S. lat. 6° 40′. E. long. 105° 15′.

JUNCUS, in *Botany*, an old Latin word, *a jungendo*, ſay the etymologiſts, from the uſe of the plants which bear this name in joining or binding things together. The Ruſh.—Linn. Gen. 173. Schreb. 230. Willd. Sp. Pl. v. 2. 204. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 374. Brown. Prodr. Nov. Holl. v. 1. 258. Juſſ. 44. Tourn. t. 127. Lamarck Dict. v. 3. 263. Illuſtr. t. 250. Gærtn. t. 15. Claſs and order, *Hexandria Monogynia*. Nat. Ord. *Tripetaloideæ*, Linn. *Junci*, Juſſ.

Gen. Ch. *Cal.* Perianth of ſix oblong, pointed, permanent leaves, inferior. *Cor.* none. *Stam.* Filaments ſix, (in J. *conglomeratus* only three), capillary, very ſhort; anthers oblong, erect, the length of the perianth. *Piſt.* Germen ſuperior, pointed, triangular; ſtyle ſhort, thread-ſhaped; ſtigmas three, long, thread-ſhaped, downy, inflexed. *Peric.* Capſule inveſted with the calyx, triangular, of three more or leſs completely divided cells, with three valves, the partitions from their centre. *Seeds* various in number, rarely ſolitary, roundiſh.

Eſſ. Ch. Calyx of ſix leaves, permanent. Corolla none. Capſule ſuperior, of three valves, with one or three cells. Seeds ſeveral. Stigmas three.

The extenſive and very natural genus of *Juncus* is commodiouſly enough divided into two ſections; the firſt containing ſuch as have leafleſs ſtems, the ſecond thoſe with leafy ones. Of the former Willdenow reckons fifteen ſpecies, of the latter twenty-five. This author has judiciouſly enriched his ſtock by adopting thoſe indubitable, chiefly alpine, ſpecies, which Scheuchzer, Haller, Allioni and other alpine botaniſts had well defined, but which Linnæus had, rather incautiouſly, huddled together under his *piloſus* and *campeſtris*. His Syſt. Veg. ed. 14, contains only twenty-two in all. Lamarck has thirty-two. The *palleſcens* of the latter, omitted by Willdenow, is very diſtinct, though near *articulatus*, found at Buenos Ayres. Its flowers are much fewer together than in *nodoſus*, to which Lamarck ſuſpected it might belong. Mr. Brown has added nine New Holland ſpecies, previouſly nondeſcript, to the catalogue, and we believe America affords ſeveral more.

Eight Britiſh ſpecies are found in the firſt ſection, fifteen in the ſecond. Of the former may ſerve as examples,

J. *acutus*, Engl. Bot. t. 1614, a large and rigid ſpinous-pointed plant, found on ſome of our ſandy ſea-coaſts, but rarely.

J. *maritimus*, t. 1725, much more common, and found not only in clean ſand, but in muddy ſalt-marſhes alſo, confounded with the former by Linnæus, from which it differs in its more ſlender form, glaucous colour, and oblong capſules.

J. *conglomeratus*, t. 835, which is triandrous, and *effuſus*, t. 836, are both extremely common in moiſt places, as is *ſquarroſus*, t. 933, on the moſt dry and barren ſandy heaths.

The ſecond ſection, with leafy ſtems, is much more various and remarkable. In the beginning of it we find a tribe whoſe leaves are internally cellular, with tranſverſe partitions, ſo as to feel, and even to look, jointed. Theſe are ſcarcely yet well underſtood, eſpecially the American ones, to which the Linnæan *nodoſus* belongs. Thoſe of Britiſh growth have lately been well elucidated by the Rev. H. Davies in Tr. of Linn. Soc. v. 10. See Engl. Bot. t. 238, now called *acutiflorus*, t. 2143, *lampocarpus*, and t. 2144, *obtuſiflorus*, all confounded by Linnæus under his *articulatus*.—A more ſlender tribe ſucceed. J. *bulboſus*, t. 934, very improperly ſo called, from a bulbous-rooted ſpecies, J. *uliginoſus*, t. 801, whoſe ſynonym was once referred to it. J. *bufonius*, t. 802, with a very compound ſlender ſtem, is common in watery places, and rather extraordinary in its genus for having only an annual root. J. *gracilis*, t. 2174, a new Scottiſh ſpecies, reſembles it in general aſpect, but is not ſo much branched, nor ſo leafy.

J. *biglumis*, t. 898, *triglumis*, t. 899, and *caſtaneus*, t. 900, are three rare and curious mountain kinds, the firſt in particular, a Lapland plant, extremely uncommon in Britain, and ſcarcely well known by ſome of our beſt botaniſts. It may however always be diſtinguiſhed from two-flowered ſpecimens of *triglumis*, by the flowers being placed one above another, not in the ſame plane.

The genus finiſhes with another very diſtinct tribe, whoſe copious broad leaves, and more or leſs panicled numerous flowers, with a ſhining brown, yellow, or brilliant white calyx, give their leading characters. Of theſe are the common J. *piloſus*, Engl. Bot. t. 736; the more rare J. *Forſteri*, t. 1293; the great *ſylvaticus*, t. 737 (Willdenow's *maximus*); the beautiful *luteus* of Allioni, Villars Dauph. t. 6, common on the alps of Switzerland, Savoy, &c.; the elegant *niveus* found on the mountains of Italy, Switzerland, and ſome parts of Germany; and our common *campeſtris*, Engl. Bot. t. 672.

JUNDGEH, in *Geography*, a town of Aſiatic Turkey, in the province of Natolia; 16 miles W. of Kintaja.

JUNDOO, a town of Bengal; 5 miles S. of Ghidore.

JUNE, the ſixth month of the year, during which the ſun enters the ſign of Cancer. The word comes from the Latin *Junius*, which ſome derive *a Junone*. Ovid, in the ſixth of his Faſti, makes the goddeſs ſay,

> "Junius a noſtro nomine nomen habet."

Others rather derive it *a junioribus*, this being for young people, as the month of May was for old ones.

> "Junius eſt juvenum, qui fuit ante ſenum."

In this month is the ſummer ſolſtice.

JUNERE, or JENCAGHUR, in *Geography*, a town of Hindooſtan, in the country of Baglana; 122 miles W.S.W. of Aurungabad. N. lat. 19° 11′. E. long. 73° 59′.

JUNES, EL, a town of Morocco; 15 miles N.E. of Azamor.

JUNGDRAWBERG, a town of Pruſſia, in the palatinate of Culm; 20 miles S. of Dantzic.

JUNGERBAD, a town of Hindooſtan; 35 miles W. of Benares.

JUNGERMANNIA, in *Botany*, a cryptogamic genus of plants, very numerous in ſpecies, as well as diſtinct in character, named by Ruppius and Micheli, who have been followed by all botaniſts ſince, in honour of Lewis Jungermann, Profeſſor of Botany at Altdorf, and afterwards at Gieſſen, in the early part of the ſeventeenth century. He wrote catalogues of the wild plants found near thoſe towns, as well as near Leipſic, his native place, and Frankfort on the Maine. Haller ſays he left a fine *hortus ſiccus* of two thouſand plants, which is ſtill preſerved at Altdorf. Of him it may juſtly be ſaid, that the genus in queſtion has preſerved his name, rather than his merits, from oblivion; for thoſe to whom it is familiar, commonly rather wonder than take any pains to inquire, who Jungermann was. Linn. Gen. 564. Schreb. 764. Mart. Mill. Dict. v. 2. Mich. Gen. 6. t. 5. Hedw. Theor. 83. t. 22, 23. Schmidel. Monogr. ann. 1760. cum tab. Juſſ. 8. Lamarck Dict. v. 3. 278. Illuſtr. t. 875. (Lichenaſtrum; Dill. Muſc. 479. t. 69—74.) Claſs and order, *Cryptogamia Algæ*, Linn. *C. Hepaticæ*, Schreb. Nat. Ord. *Algæ*, Linn. *Hepaticæ*, Juſſ.

Gen. Ch. Male, *Cal.* and *Cor.* none. *Stam.* Anthers aggregate, of an indeterminate number, in powdery heads, which are either ſtalked, ſeſſile, or immerſed in the ſubſtance of the frond.

Female on the ſame (rarely on a ſeparate) plant. *Cal.* Perianth erect, tubular, truncate, variouſly crenate or jagged. *Cor.* Veil membranous, ſeſſile, ſmaller than the perianth, ſomewhat globoſe, cloſed on all ſides, crowned with the ſtyle, at length burſting at the top. *Piſt.* Germen oblong, ſeſſile, encloſed in the veil; ſtyle ſolitary, cylindrical, terminating the veil; ſtigma abrupt, tubular. *Peric.* Capſule elevated on a long, fleſhy, very tender, pale, ſimple, cylindrical ſtalk, globoſe, of one cell, at length burſting into four equal, permanent valves, ſpreading in the form of a croſs. *Seeds* very numerous, globular, adhering by ſpiral elaſtic fibres to the baſe, ſummit, diſk or margin of the valves.

Obſ. Several germens are often found in one perianth, though only one of them comes to perfection, the others withering at the baſe or ſides of its veil.

Eſſ. Ch. Male, Anthers aggregate, in powdery heads. Female, Capſule of four valves, on a ſtalk riſing from a tubular calyx. Seeds attached to elaſtic filaments.

Nothing can be more elegant than the general habit of this genus, which is, in a manner, intermediate between the true Moſſes, or *Muſci*, and the other *Hepaticæ* and *Algæ*. It is throughout highly vaſcular or cellular, exhibiting the appearance of fine internal reticulations, as in *Hookeria* and ſome other moſſes; but the texture is commonly more tender and ſucculent than in that family. Some ſpecies emit an aromatic fragrance, like that of red cedar wood, very perceptible and delightful in groves, or the ſhady walks of gardens. The capſule is eſſentially different from that of the true moſſes, in having no *operculum* or lid; but the ſingular character of the ſtyle terminating the veil, or corolla, is proper to both. Great ambiguity occurs in the botanical deſcriptions of the various ſpecies, from Linnæus having termed the whole plant a frond, though he often inadvertently calls its ſegments leaves, *folia*, and ſpeaks of the *ſtem*, as if the plant were a real *herba*, as in the *Muſci*. On this ſubject the writer of the preſent article has long been at a loſs to form a decided opinion, and in the deſcriptions of many *Jungermanniæ* in *Engliſh Botany*, has given into the practice of Schreber and others, who uſe the terms leaves and ſtipulas, for what, according to the original Linnæan principle, are ſegments of the frond, leaflets, or ſcales. On mature deliberation, however, it ſeems beſt to keep rigidly to this laſt-mentioned principle. The ſtalks, and the leaflets, or ſegments of the fronds, will always be found homogeneous and inſeparable. The apparent leaves are never thrown off like the real leaves of other plants, but are of one ſubſtance with the part that bears them. The *Jungermanniæ acaules*, which conſtitute the laſt ſection of the genus, as *epiphylla*, Hedw. Theor. t. 21—23; *pinguis*, Engl. Bot. t. 185; *multifida*, t. 186, &c. have to all intents and purpoſes real fronds, not ſtems and leaves; and it would be offering great violence to nature to ſuppoſe ſome ſpecies of a genus to be frondoſe and others herbaceous. Some German writers indeed cut this gordian knot, by aboliſhing the term frond altogether; but againſt ſuch a meaſure we muſt put in our decided proteſt. (See FROND.) Little difficulty will ariſe from calling the ſegments leaflets inſtead of leaves. and what have been termed ſtipulas, may, by the analogy of ferns, be ſafely named ſcales, *ſquamæ*. In Engl. Bot. v. 31. p. 2231, we have ſuggeſted the propriety of terming the larger half of the leaflet, (in thoſe ſpecies uſually known by the appellation of auricled,) in Latin *lobus*, and the ſmaller one, or auricle, *lobulus*. This will be found very commodious in conſtructing neat ſpecific characters. In Engliſh *leaflet* and *ſide-lobe* will be equivalent to thoſe terms.

On all theſe particulars, and others, we have had frequent conſultation with our able friend Mr. W. J. Hooker, whoſe attention to this genus has been very deep and minute, and who has undertaken to illuſtrate the Britiſh ſpecies in particular, with excellent figures and deſcriptions.

Our native ſpecies amount to above 60, though Hudſon has but 30. The foreign ones are very numerous, but the greater part remain undeſcribed, except what profeſſor Swartz has given in his *Prodromus*. Mr. Archibald Menzies collected, at the Cape of Good Hope, Staten Land, the weſt coaſt of North America, and eſpecially at Duſky bay, in New Zealand, a profuſion of new and magnificent ſpecies, of which he has favoured us with ſpecimens, but he reſerves to himſelf their deſcription, which is anxiouſly expected by his friends. It is preſumed that 150 *Jungermanniæ* might eaſily be reckoned up. Linnæus's Syſt. Veg. ed. 14, has but 33 in all, but his herbarium contains many more. Dillenius was the firſt who laboured with much ſucceſs to explain the ſpecies of this genus, though Micheli alſo beſtowed no ſmall pains upon them, but his figures are, in this inſtance, not very expreſſive. Schmidel, in his *Icones*, has illuſtrated a few ſpecies ſo amply and accurately as to leave nothing to be wiſhed. It is but juſtice to Mr. Sowerby to ſay, that the plates he has given of *Jungermanniæ*, in Engl. Bot. are as characteriſtic as moſt botanical figures of any kind.

A natural diſtribution of the ſpecies is ſtill wanting. Linnæus divides them into five ſections.

1. *Fronds pinnate; leaflets turned to one ſide.* Of this the common *J. aſplenioides*, Engl. Bot. t. 1788, and *bidentata*, t. 606, are examples.

2. *Fronds pinnate; leaflets with auricles, or ſtipulas (rather ſcales), beneath.*

See *J. nemoroſa*, t. 607, which has auricles (ſide-lobes) and *reptans*, t. 608, which has ſcales.

3. *Fronds imbricated.*

Under this head are arranged *tamariſcifolia*, t. 1086, *ciliaris*, t. 2241, and ſome other very fine ſpecies.

4. *Shoots imbricated on all ſides, the leaflets ſcattered.*

To this belong *concinnata*, t. 2229, and *trichophylla*, t. 2252. *J. rupeſtris* and *alpina* are properly eſtabliſhed as a genus of real *Muſci* by Ehrhart, under the name of *Andreæa*, *Andræa* of Fl. Brit. 1178. Engl. Bot. t. 1277, 1278, and 2162, and Hooker in Tr. of Linn. Soc. v. 10. 381.

5. *Without a ſtem, the fronds being ſimple.*

To this, as we have already ſaid, belong *epiphylla*, *pinguis*, and *multifida*.

The intelligent reader will eaſily perceive the inſufficiency and inaccuracy of theſe ſubdiviſions, and the neceſſity of better. The difficulty lies in finding technical characters to mark natural ſections. It is eaſy enough to arrange any natural objects by ſuch characters artificially, without regard to their real affinities. S.

JUNGEVSKOI, in *Geography*, a town of Ruſſia, in the government of Toboliſk; 56 miles S. of Kemſkoi.

JUNGFRAU (probably from the Celtic *Jun-fra*, *i. e.* a place from which water deſcends), a mountain in the canton of Bern, in Switzerland, which, according to profeſſor Tralles's trigonometrical ſurvey, riſes 12,852 feet above the level of the ſea, and affords a ſpectacle, the ſublime beauty of which is ſcarcely equalled by any other object of nature in the Alps. The middle part of this ſtupendous maſs is more generally known by the above name; the cuneiform rock towards the right hand (when viewed from the Pletſch mountain) is called the *Monk*, and the ſummit, covered by eternal ſnows, is called the *Jungfrau-horn*. The valley of Lauterbrunn, at the foot of this mountain, is too confined to allow the eye to ſeize the whole grandeur of the object before it; but from the neighbouring Pletſch mountain it may be ſeen to the greateſt advantage, together with the vaſt groups of other craggy mountains and glaciers with which it is connected.

We read in an article from Bern, in the Moniteur of 25th Aug. 1811, that, in the beginning of that month, two Swiſs gentlemen have ſucceeded in aſcending the ſummit of this ſtupendous mountain, an undertaking which, hitherto, has been deemed impracticable. After having ſpent three days and four nights on the ſnow and ice, and made ſome fruitleſs attempts, they have ſeen their endeavours crowned on the 3d of Auguſt, when they reached the ſummit, where they fixed a black flag. They intend publiſhing an account of this remarkable journey.

JUNGFRUN, Stron, a ſmall iſland, about ſix miles in circuit, on the W. ſide of the gulf of Bothnia; it is high and rocky, and dangerous to navigators. N. lat. 61° 10′. E. long. 17° 10′.

JUNGFRUN, *Lill*, another ſmall iſland on the W. ſide of the gulf of Bothnia. N. lat. 61° 16′. E. long. 17° 9′.

JUNGHERAH, a ſmall iſland in the river Ganges, on which is a ſeminary of Hindoo mendicants; 12 miles from Boglipour.

JUNGIA, in *Botany*, ſo named by the younger Linnæus, in memory of Joachim Jungius, a learned German botaniſt of the 17th century. (See JUNGIUS.) Linn. Suppl. 58. Schreb. 589. Willd. Sp. Pl. v. 3. 2391. Mart. Mill. Dict. v. 2. Juſſ. 175.—Claſs and order, *Syngeneſia Polygamia-ſegregata*. Nat. Ord. *Compoſitæ capitatæ*, Linn. *Cinarocephalæ anomale*, Juſſ.

Gen. Ch. *Cal.* Common perianth of many, ſomewhat ſpreading, linear, obtuſe, channelled leaves, containing three or four flowers: partial longer, many-flowered, of many, nearly equal, oblong, channelled, obtuſe, erect leaves. *Cor.* compound, of uniform, hermaphrodite, equal florets: partial of one petal, funnel-ſhaped; the tube dilated upwards; limb of two lips; the outer longeſt, revolute, linear, toothed at the extremity; inner deeply divided into two ſmall, erect, acute ſegments. *Stam.* Filaments five, very ſhort, inſerted into the tube of each floret; anthers united into a cylinder. *Piſt.* Germen inferior, linear, angular; ſtyle thread-ſhaped; ſtigmas two, revolute, obtuſe. *Peric.* none, except the unaltered calyx. *Seeds* ſolitary, angular. *Down* long, ſeſſile, feathery. *Recept.* clothed with ſcales, reſembling the leaves of the calyx.

Eſſ. Ch. Receptacle chaffy. Common perianth containing three flowers. Florets tubular, two-lipped; the outer lip ligulate; inner deeply divided.

1. *J. ferruginea.* Linn. Suppl. 390. Gathered by Mutis, or ſome of his pupils, in New Granada. A *tree* or *ſhrub*, whoſe branches are round, clothed with ſoft down, of a ruſty hue, at leaſt in the dried ſpecimen. *Leaves* alternate, remote, ſtalked, flat, rounded, bluntly five-lobed; heart-ſhaped at the baſe; hairy on both ſides; lighter coloured beneath. The only leaf we have ſeen is two inches in diameter, but there is reaſon to think the lower ones may be much larger. *Footſtalks* downy and ruſty. *Panicle* terminal, large, repeatedly branched with downy ſtalks. *Flowers* in roundiſh cluſtered heads. *Florets* purple, encompaſſed with the long white down of the ſeed.

This plant is known in Europe by the ſingle ſpecimen in the Linnæan herbarium only, nor has any figure of it appeared.

JUNGILE, in *Geography*, a town of Hindooſtan, in Benares; 20 miles S. of Bidzigur.

JUNGIPOUR, a town of Hindooſtan, in Bengal, where the Eaſt India Company have a factory for raw ſilk; 20 miles N. of Moorſhedabad.

JUNGIUS, JOACHIM, in *Biography*, an eminent mathematician, phyſician, and botaniſt, the ſon of a ſchoolmaſter at Lubec, in Germany, was born on the 21ſt of October 1587. His mother was daughter to a clergyman of the cathedral church at Lubec. Jungius having unfortunately been deprived of his father very early in life (for he was ſtabbed one evening upon his return home from a convivial party), and being left with a ſlender patrimony, was obliged to depend almoſt entirely upon his own exertions for whatever knowledge and information he was anxious to acquire, the narrowneſs of his circumſtances not enabling him to paſs through the uſual routine of a learned and philoſophical education. Notwithſtanding this obſtacle, we are informed that, in his youth, he became a very ſubtle logician, and ingenious diſputant. By a cloſe attention to ſuch ſtudies he prepared his mind for that clearneſs of inveſtigation and accuracy of judgment, which were ſo eminently conſpicuous in the works which he publiſhed at a more advanced period of his life. Selecting the ſtudy of medicine as a profeſſion, he travelled, at the age of 30, over a great part of Italy, and viſited many of the principal places in Germany. His great object in travelling was to become acquainted with ſome of the moſt diſtinguiſhed phyſicians of that time, from whoſe company and converſation he hoped to derive much amuſement and inſtruction. He had previouſly graduated at the univerſity of Gieſſen A. D. 1607, at which time he was ranked firſt among his competitors in the liſt of honours, and he remained there a few years in the capacity of mathematical tutor. In 1624 he married Catharine, the daughter of Valentine Haſſeman, a reſpectable citizen of Roſtock, in Lower Germany, by whom he had no iſſue. She died in 1638, from which period he remained a widower. He had been choſen profeſſor of phyſic at Helmſtadt in 1625, which had led him to remove from Roſtock; but, on account of the Daniſh war, he was obliged, ſoon after his appointment, to fly to Brunſwick, where he reſided for a ſhort time, and practiſed as a phyſician. However, he ſoon returned to Helmſtadt, till, in 1629, he was appointed rector of the ſchool at Hamburgh.

Jungius ſeems to have eminently diſtinguiſhed himſelf in the ſeveral ſtudies of theology, medicine, mathematics, metaphyſics, and botany, upon all which purſuits his opinions and obſervations are handed down to us in his writings, though the moſt famous part of his work, entitled "Doxoſcopiæ Phyſicæ Minores," is upon the laſt mentioned ſubject, botany. This book was firſt printed at Hamburgh, in 4to. A.D. 1662, and again, in 1679, under the care of Martin Fogel, with this additional title, "Præcipuarum opinionum phyſicarum." A copy of the former edition of this work is in the Linnæan library, having been preſented to Linnæus by his pupil, profeſſor P. D. Giſeke, of Hamburgh. The botanical part of it, included in the third ſection of the ſecond part, occupies about 100 pages. Here are to be found many judicious and acute rules for making diſtinct ſpecies of plants, as well as ſome curious remarks upon genera. Profeſſor Jungius was alſo the firſt author who contended that trees cannot with propriety be ſeparated from other plants with reſpect to their claſſification, though the honour of having firſt ſtarted this idea is often beſtowed upon Rivinus, for till this time trees had been regarded as a ſuperior kind of productions in the vegetable kingdom. Jungius preferred the diſcriminative marks afforded by the herbage in general, *viz.* the leaves, ſtalks, and flower-cups of plants to thoſe which are taken from colour, taſte, or ſmell. He was a great critic in botanical nomenclature; and conſtructed a variety of terms which agree with thoſe of Linnæus. Many ſpecies of plants were judiciouſly ſeparated and determined by him, which had before been entirely miſplaced or confuſedly arranged. He moreover detected the ſeed of certain plants which, till his time, were ſuppoſed to have been deſtitute of ſeed, eſpecially in the genus *Salix*. His remarks upon botanical diſcrimination have been of conſiderable advantage to ſucceeding botaniſts, and many of his definitions are repeatedly made uſe of by our immortal countryman, Ray. What further teſt of his abilities is requiſite? It has been ſaid, with a view to detract from the fame of Linnæus, that the works of our author furniſhed him with many hints which he never acknowledged; but this is ſcarcely poſſible, for though their ideas accord in many points, yet there is reaſon to believe that Linnæus never ſaw the writings of Jungius till long after his own were publiſhed.

Much credit is due to the ſubject of our memoir for having been the firſt who projected and raiſed a literary ſociety in

Germany, though this inſtitution did not ſhare a better fate than the one which had juſt before been found in this country (and which appears to have ſerved for its model) by Hugh Latimer, Thomas Linacre, and others, for the purpoſe of diſcuſſing and illuſtrating Ariſtotle's philoſophy. They both flouriſhed but for a ſhort period, though the Heunetic or Ereunetic ſociety, as it was called, eſtabliſhed by profeſſor Jungius, was on a far more comprehenſive plan than the other, and may indeed be conſidered as having, in ſome meaſure, embraced the ſame views with which the Royal Society was afterwards inſtituted in Great Britain. The fame of Jungius was originally diffuſed through this country by his noble pupil, the honourable Charles Cavendiſh, who appears to have ſtudied under him at Hamburgh. This gentleman was brother to the earl of Newcaſtle, who had the care of Charles I. when a youth.

After a long life, ſpent in the acquirement and diffuſion of general philoſophical knowledge, and having always manifeſted a ſtrong attachment to the Lutheran church, profeſſor Jungius departed this life on the 23d of September 1657, at the age of 70 years, and was buried in the church of St. John at Hamburgh, where a handſome tablet was inſcribed to his memory by his friend and pupil, Michael Kirſten. The following is a liſt of his works, as given by Martin Fogel, who edited the ſecond edition of his "Doxoſcopiæ."

Logica Hamburgenſis. Hamb. 1638, in 8vo.

Geometria Empirica. Roſtock. ſemel et Hamb. bis, in 4to.

Doxoſcopiæ Phyſicæ Minores, ſine Iſagoge Phyſica Doxoſcopica. Hamb. 1662, in 4to.

Kurzer Bericht von der Didactica oder Lehrkunſt Wolfgangi Ratichii, durch Chriſtoph. Helvicum und Joach. Jungium. Gieſſen, 1614, in 4to.

Diſputationes de naturali Dei cognitione: de potentiâ activâ: de loco Ariſtotelis, lib. 3. de cœlo, t. 66: de figuris locum replentibus: de relationibus: de notionibus ſecundis: de demonſtratione tritermina: de definitionibus, &c.

Haller's Bibl. Bot. Witten. Memoriæ Philoſophorum, Franckfort, 1679.

JUNGKEN, John Helfric, a phyſician, was born at Kalern, in Heſſe, in December 1648, and was diſtinguiſhed by his abilities during his early ſtudies. He purſued his medical education at Marpurg and at Heidelburg, and took the degree of doctor at the latter univerſity in 1671. After this period, he ſpent many years in travelling in purſuit of knowledge, and finally ſettled at Frankfort on the Maine in 1689, and was appointed phyſician to the public hoſpital there in 1693. He obtained a high reputation and a moſt extenſive practice, in the courſe of which, however, he publiſhed ſeveral works. He died, greatly regretted, on the 5th of January, 1726. His writings are now ſeldom referred to, and it will be unneceſſary here to detail the long titles of them. They treated of every branch of the profeſſion, but chiefly on chemiſtry and pharmacy; and his pathology was founded on the mathematical doctrines, eſpecially thoſe of Deſcartes. Eloy. Dict. Hiſt.

JUNGLEBARRY, in *Geography*, a town of Bengal; 50 miles N. of Dacca.

JUNGNAU, a town of Germany, and capital of a lordſhip belonging to the princes of Furſtenberg; 14 miles W. of Buchau.

JUNCS Hound, or *Head*, a cape of Denmark, on the E. coaſt of the iſland of Zealand. N. lat. 53° 7'. E. long. 12° 11'.

JUNIATTA, a town of America, in Pennſylvania, 5 miles W.N.W. of Huntingdon.—Alſo, a river of Pennſylvania, which riſes from two ſprings in the Allegħany mountains, and runs into the Suſquehannah, 15 miles N.W. of Harriſburg.

JUNIEU, St., a town of France, in the department of the Upper Vienne, and chief place of a canton, in the diſtrict of Rochechouart; 15 miles W. of Limoges. The place contains 6046, and the canton 12,519 inhabitants, on a territory of 170 kiliometres, in ſeven communes. N. lat. 45° 53'. E. long. 9° 5'.

JUNIOW, a town of Poland, in the palatinate of Braclaw; 52 miles N. of Braclaw.

JUNIPA, in *Botany*, the name of a tree of the Caribbee iſlands, and ſome other places, the fruit of which is ſaid to yield a juice as clear as water, yet yields a fine violet-coloured dye, and being rubbed twice on the ſame place, makes it black. This tincture, it is ſaid, cannot be got out by ſoap, or any other method of cleanſing, but after nine or ten days diſappears of itſelf. It is ſaid alſo, by the ſame authors, that hogs and parrots, feeding on this fruit, have their fleſh and their fat all tinged throughout of a violet colour.

JUNIPERUS, an ancient Latin name, of whoſe meaning or derivation no account is given.—Juniper. Linn. Gen. 531. Schreb. 705. Sm. Fl. Brit. 1085. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 413. Tournef. t. 361. Juſſ. 413. Lamarck. Illuſtr. t. 829. Gærtn. t. 91.—Claſs and order, *Diœcia Monadelphia*. Nat. Ord. *Coniferæ*, Linn. and Juſſ.

Gen. Ch. Male, *Cal.* Catkin conical, conſiſting of a common receptacle, bearing three rows of three flowers each, with a terminal one; the baſe of each flower is a broad, ſhort, incumbent ſcale fixed by a ſtalk to the common receptacle. *Cor.* none. *Stam.* Filaments (in the terminal flower) three, awl-ſhaped, united below into one body (in the lateral flowers ſcarcely perceptible); anthers three, diſtinct in the terminal flower, but in the lateral ones attached to the baſe of each ſcale.—Female, *Cal.* the ſcales of a catkin, fewer, imbricated, the upper ones at length fleſhy and permanent. *Cor.* none. *Piſt.* Germens three, imbedded in the uppermoſt ſcales; ſtyles three, ſimple; ſtigmas ſimple. *Peric.* Berry fleſhy, roundiſh, marked in the lower part with three, oppoſite, obſolete tubercles, the points of the coaleſced ſcales, and at the top umbilicated with three teeth. *Seeds.* Nuts three, oblong, convex on one ſide, angular on the other; abounding with cells of turpentine on the outſide.

Eſſ. Ch. Male, Calyx-ſcales of a catkin. Corolla none. Stamens three.—Female, Calyx-ſcales of a catkin, fewer, at length pulpy, united into a berry with three ſeeds.

1. *J. communis.* Common Juniper. Linn. Sp. Pl. 1470. Engl. Bot. t. 1100. Woodv. Med. Bot. t. 95.—Leaves three together, ſpreading, tipped with a ſpine, and longer than the ripe fruit.—A native of open, hilly places on a calcareous ſoil, flowering in May, though by no means a common plant in Britain.—This *ſhrub* is generally of humble growth, much branched, rigid, ſmooth, evergreen. *Juice* of the whole plant a kind of turpentine. *Wood* hard and durable. *Leaves* oppoſite, acerofe, channelled, ſharp-pointed, glaucous above. *Catkins* diœcious, axillary. *Berry* globoſe, dark-purple, covered with a glaucous dew, ſweetiſh and aromatic.—The alpine variety β is more humble in its growth, and more depreſſed, having broader *leaves* and rather oblong *berries*.—The bark of juniper is frequently converted into ropes, and it is well known that ſpirits, when impregnated with the eſſential oil of its berries, become Juniper water, or Gin.—Linnæus obſerves, in his *Flora Lapponica*, n. 376, that the Laplanders drink infuſions of the Juniper-berries, as we do tea and coffee, and that the

Swedes prepare a beverage from them in great eſtimation for its diuretic and antiſcorbutic qualities.—There is reaſon to preſume that the Swediſh variety of this ſhrub, which is much taller and more arboreſcent than our's, may be a diſtinct ſpecies.

Linnæus enumerates nine ſpecies of this genus, and profeſſor Martyn eleven, the moſt remarkable of which are the following.—*J. Oxycedrus*, the brown-berried Juniper, a native of Spain, the ſouth of France, and the Levant.—The wood of this ſpecies is ſuppoſed to have been the famous cedar of the ancients, celebrated for its durability, of which ſome of their firſt ſtatues were made, before the uſe of marble in this branch of art was known.—*J. virginiana*, a native of North America, the Weſt India iſlands, and Japan.—The wood of this tree is celebrated for its very powerful fragrance, and for reſiſting the attacks of inſects, being the well-known red cedar, uſed for lead pencils, and formerly in great requeſt for wainſcotting, and cabinet-work. Large trees of it are not uncommon in the older gardens and ſhrubberies of this country.—*J. bermudiana* is alſo a hardy tree with us. It is ſuſpected that more ſpecies than one have been confounded under this or the laſt.—*J. ſabina*, the common Savin, a native of the ſouth of Europe, is ſufficiently well known, and is a popular medicine in ſome female complaints, being alſo ſuppoſed to be powerfully capable of procuring abortion. It is commonly of humble growth, but ſometimes forms a handſome dark evergreen buſh three or four feet high. In Greece it is ſaid to become a tree like a cypreſs, with a trunk a foot in diameter. Botaniſts are by no means correctly verſed in the ſpecies of this genus, or the varieties to which they are ſubject.—*J. Lycia*, is with difficulty diſtinguiſhed from the laſt; its ſhoots are however ſomewhat thicker, and its leaflets more acute and leſs cluſtered. It is a native of the ſouth of France and the Levant.—The gum-reſin *Olibanum*, of a ſtrong ſmell, and bitteriſh pungent taſte, is extracted from the Lycian cedar, and is ſuppoſed to have been uſed by the ancients in their ſacrifices, being ſtill employed in Catholic countries in their religious ceremonies, as incenſe.

JUNIPERUS, in *Gardening*, comprehends plants of the evergreen tree and ſhrub kinds, of which the ſpecies generally cultivated are, the common juniper (J. communis); the brown-berried juniper (J. oxycedrus); the Spaniſh juniper (J. thuſifera); the Barbadoes juniper (J. barbadenſis); the Bermudas juniper (J. bermudiana); the ſavin (J. ſabina); the Virginian juniper, or red cedar (J. virginiana); the Phœnician juniper, or cedar (J. phœnicea); and the Lycian juniper, or cedar (J. lycia).

The ſixth ſpecies has a variety with variegated leaves.

And the ſeventh ſpecies affords the Swediſh or tree juniper, which riſes to a very conſiderable height. Alſo the alpine or mountain juniper, which has the leaves broader and thicker, and the berries of a rather oval ſhape.

Method of Culture.—All theſe plants, except the fifth ſort, may be increaſed either by ſeeds, layers, or cuttings; the latter methods are proper for the ſavin kinds.

The ſeeds or berries ſhould be ſown in beds of light earth, in the early autumn or ſpring, but the former is the better in light ſoils, in a warm ſheltered ſituation, in the open ground, being well raked in. The beds ſhould be kept perfectly clear from weeds, and the young plants be occaſionally watered during the ſummer ſeaſon. When the plants have had two years growth in theſe beds, and are become ſtrong, they ſhould be removed into nurſery rows at two feet apart, and a foot or eighteen inches diſtant in the rows. They ſhould remain in theſe ſituations till of proper growth to be planted out where they are to remain.

The layers of the young branches ſhould be laid down at either of the above ſeaſons, and, when well rooted, taken off, and planted in the nurſery, in the ſame manner as the ſeedling plants.

The cuttings ſhould be made from the young branches, and be planted in a ſhady border, in the latter end of ſummer, watering them occaſionally till they have taken good root; when they may be taken up with earth about their roots, and be managed in the ſame manner as by the other methods.

The plants raiſed in theſe laſt ways ſeldom grow ſo upright, or to ſo large a ſize, as in the ſeed method.

The common upright and ſtriped ſavins may likewiſe be increaſed by planting ſlips of the young branches; for the laſt ſort the moſt variegated being made uſe of, in the latter end of ſummer, or in the autumn, in a ſhaded border, due water being given. When the plants are come up, they muſt be managed as the other ſorts.

The fifth ſort muſt be ſown in pots or tubs, at the ſame ſeaſons as the other ſorts, being placed in a frame to have the protection of glaſſes when the weather is froſty and ſevere. As the ſeeds are long in coming up, the mould in the pots, &c. muſt remain undiſturbed till they appear, being ſhaded from the ſun, and ſlightly watered occaſionally. The young plants ſhould be kept quite free from weeds, and be duly watered till they have attained ſufficient growth to be removed into ſeparate ſmall pots, filled with light earth, which is generally when from one to two years old. In removing them, they ſhould have balls of earth preſerved about their roots, and be watered, and placed in a warm ſituation. The beſt ſeaſon for this is in the early ſpring: but it is of great advantage to plunge the pots in a mild hot-bed. They muſt be protected in the winter, either in frames, or under a warm fence; the pots being plunged in the earth. When they have been removed into different larger pots, till of ſufficient large growth, they may be planted out where they are to grow, which ſhould be in a warm ſituation. It is proper to ſhelter them the firſt two winters during ſevere froſts, by mats, or other ſimilar coverings.

The proper periods for removing all the different ſorts into the open ground are in the early autumn or ſpring months.

Theſe plants all ſucceed in the open ground, and grow in any common ſoil and ſituation, with other hardy plants of the tree kind; though they are the moſt proſperous in a light ſandy ſoil, where the aſpect is ſheltered.

In placing theſe kinds of plants in the clumps and ſhrubbery plantations, attention ſhould be had to arrange them according to their degrees of growth, ſo as to exhibit a regular gradation of height; placing the low growing ſorts, as the common juniper and ſavin kinds, towards the fronts, and the other larger growing ſorts more backwards, in aſſemblage with other ornamental ſhrubs and trees of the evergreen tribe; and ſome may be placed as ſingle ſtandards, on open ſpaces of ſhort graſs, in the pleaſure ground quarters. Some of the large growing ſorts may alſo be introduced into the foreſt-tree plantations, as they have a fine effect, and afford excellent timber for many uſes, more particularly the Virginia cedar, which arrives at a conſiderable ſize, eſpecially when the under branches are trimmed off occaſionally while young.

JUNIPERUS, in the *Materia Medica*. The tops and fruit or berries of the ſhrub juniperus, which is common on heaths in different parts of Europe, are much uſed in medicine; but the latter are preferred.

Theſe berries, which are firſt green, and when ripe of a dark purple colour, ripen in the autumn. They are chiefly brought to us from Holland and Italy; and ſhould be choſen freſh, not much ſhrivelled, and free from mouldineſs. Their ſmell is moderately ſtrong, but not diſagreeable, and their taſte is warm, pungent, and ſweetiſh, which, after they have been long chewed, or previouſly well bruiſed, is followed by a conſiderable degree of bitterneſs. The ſweetneſs of theſe berries appears to reſide in the juice, or ſoft pulpy part; the bitterneſs in the ſeeds; and the aromatic flavour in oily veſicles, ſpread throughout the ſubſtance, both of the pulp and of the ſeeds, and diſtinguiſhable even by the eye. The freſh berries yield, on expreſſion, a rich, ſweet, honey-like, aromatic juice; and if the ſeeds are thoroughly broken, the juice proves tart and bitter.

Juniper berries give out nearly all their virtue, both to water and rectified ſpirit, tinging the former of a browniſh-yellow, and the latter of a bright orange colour. Diſtilled with water, they yield a yellowiſh eſſential oil, very ſubtile and pungent, reſembling the berries in ſmell, and in quantity, when the berries have been ſufficiently bruiſed, about one ounce from forty. This oil is a very ſtimulating diuretic; the decoction inſpiſſated to the conſiſtence of a rob or extract, has a pleaſant, balſamic, ſweet taſte, with a greater or leſs degree of bitterneſs. A part of the flavour of the berries ariſes alſo in diſtillations with rectified ſpirit: the inſpiſſated tincture conſiſts of two diſtinct ſubſtances; one oily and ſweet; the other tenacious, reſinous, and aromatic. The extract may be uſed with advantage in caſes where the more ſtimulating preparations would be improper; as in catarrhs, debilities of the ſtomach and inteſtines, and difficulties of the urinary excretions, in perſons of an advanced age. Among the aromatics that have been tried in compoſition with juniper berries, ſweet fennel ſeeds, and carraway ſeeds, ſeem the beſt adapted to improve their flavour. A cordial water is prepared in the ſhops, by drawing off a gallon of proof-ſpirit from a pound of the berries, and an ounce and a half of each of the ſeeds. To this water may be uſefully ſuper-added, a proper quantity of the rob. Lewis.

The berries are chiefly uſed for their diuretic effects; and they are alſo conſidered to be ſtomachic, carminative, and diaphoretic. We have ſeveral teſtimonies in favour of the efficacy of juniper berries in many hydropical affections by phyſicians of great authority; but authors do not ſeem to be perfectly agreed which preparation of the juniper is moſt efficacious; many preferring the rob or inſpiſſated decoction; but Dr. Cullen obſerves, that this is an inert medicine, alleging that to the eſſential oil, which is much the ſame as that of turpentine, only of a more agreeable odour, he thinks all the virtues aſcribed to the different parts of juniper are to be referred. Hoffman, on the contrary, ſtrongly recommends the rob, and declares it to be of great uſe in debility of the ſtomach and inteſtines; and he found it to be particularly ſerviceable to ſuch old people as are ſubject to theſe diſorders, or labour under a difficulty with regard to the urinary excretion; whence it appears, that the berries retain medicinal powers, though deprived of the medicinal effects of the eſſential oil. Van Swieten preſcribed the following formula: ℞. Rob. bacc. junip. ℥ii; dilue in aqua junip. ℔ii; add. ſpirit. bacc. junip. ℥ii; quandoque ſpiritus nitri dulcis ℥ß ad ſitim ſedandam additur. Of this mixture one or two ounces were given every three hours. But juniper being now ſeldom or ever relied upon for the cure of dropſies, and only uſed in aid of more powerful remedies, it is juſtly obſerved by Duncan (New Ed. Diſp.) that "perhaps one of the beſt forms under which the berries can be uſed is that of a ſimple infuſion. This by itſelf, or with the addition of a little gin, is a very uſeful drink for hydropic patients." Medical writers have alſo ſpoken of the utility of juniper in nephritic caſes, uterine obſtructions, ſcorbutic affections, and ſome cutaneous diſeaſes; and in the two laſt-mentioned complaints, the wood and tops of the plant are ſaid to have been employed with greater advantage than the berries. Our Pharmacopeias direct the eſſential oil and a ſpirituous diſtillation of the juniper berries to be kept in the ſhops: the former, in doſes of two or three drops, is found to be an active and ſtimulating medicine; the latter contains this oil, and that of ſome other aromatic ſeeds united to the ſpirit, and therefore differs not conſiderably from the genuine geneva imported from Holland: but there is great reaſon to believe, that the gin uſually ſold here is frequently nothing but the frumentaceous ſpirit, imbued with turpentine, or other materials to give it a flavour. Woodv. Med. Bot.

Etmuller had a high opinion of juniper berries. The rob made of the expreſſed juice of the green berries has been called by many, the *theriaca Germanorum;* ſo much are they eſteemed by that nation for their alexipharmic qualities.

The wood of juniper, it is ſaid, will laſt a hundred years without corrupting; the chemiſts add, that a coal of juniper, covered with aſhes of the ſame kind, will keep on fire an entire year.

From this juniper, the gum ſandaracha is obtained: it exudes through the crevices of the bark, or the perforations made by inſects.

The bark of the *Juniperus Lycia* yields the officinal gummy reſinous ſubſtance, called Olibanum. See FRANKINCENSE and OLIBANUM.

The *Juniperus Sabina*, or common ſavin, is a native of the ſouth of Europe and the Levant: it has been long cultivated in our gardens; and from producing male and female flowers on ſeparate plants, it was formerly diſtinguiſhed into the barren and berry-bearing ſavin. The leaves and tops of ſavin have a moderately ſtrong ſmell, ſomewhat diſagreeable, and a hot, bitteriſh, acrid taſte: they give out part of their active matter to watery liquors, and the whole to rectified ſpirit. Diſtilled with water, they yield a large quantity of eſſential oil. From thirty-two ounces Hoffman obtained five ounces of this oil, in which the whole virtue of the plant ſeems to reſide. Decoctions of the leaves, inſpiſſated to the conſiſtence of an extract, retain a conſiderable ſhare of their pungency and warmth along with their bitterneſs, and have ſome degree of ſmell, not reſembling that of the plant itſelf. On inſpiſſation of the ſpirituous tincture, there remains an extract, conſiſting of two diſtinct ſubſtances, of which one is yellow, unctuous or oily, bitteriſh, and very pungent; the other black, reſinous, tenacious, leſs pungent, and ſubaſtringent. Lewis' Mat. Med.

Savin is a powerful and active medicine, and has been long reputed the moſt efficacious in the Materia Medica, for producing a determination to the uterus, and thereby proving emmenagogue: it heats and ſtimulates the whole ſyſtem very conſiderably, and is ſaid to promote the fluid ſecretions. Its force in overcoming interior obſtructions is ſo great, that it is ſaid to have been employed, and too ſucceſsfully, for purpoſes the moſt infamous and unnatural. It has, however, ſometimes failed as an emmenagogue, which has, in ſome meaſure, been aſcribed to the ſmallneſs of the doſe given by phyſicians. Dr. Hume (ſee Clinical Exper.) ſeems to have had very great ſucceſs with this medicine; for in five caſes of amenorrhœa, which occurred at the Royal Infirmary at Edinburgh, four were cured by the ſabina, adminiſtered in powder from a ſcruple to a dram twice a day. He ſays it is well ſuited to the debile, but improper in plethoric habits; and he therefore orders repeated bleedings before its exhibition. Externally ſavin is recommended as an eſcharotic to foul ulcers, ſyphilitic warts, &c. Woodv. Med. Bot.

JUNISEN, in *Geography*, a town of Sweden, in the lapmark of Kemi; 64 miles N.N.E. of Kemi.

JUNIVILLE, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Rethel. The place contains 984, and the canton 5775 inhabitants, on a territory of 215 kiliometres, in 13 communes.

JUNIUS, FRANCIS, in *Biography*, a learned French Proteſtant divine, deſcended from a noble family, was born at Bourges in the year 1545. At the age of thirteen, he had made an extraordinary proficiency in learning; and being intended for public life, he began the ſtudy of the civil law, and after proſecuting it for ſome years, he was ſent to Lyons, to join the train of the ambaſſador from the king of France to Conſtantinople. He unfortunately arrived too late, and accordingly remained in that city to attend the public lectures of the college. Here, by his avidity in purſuing knowledge, he recommended himſelf to the principal, which was of great ſervice to him in his ſtudies. In this city he became acquainted with a perſon deeply tinctured with ſceptical notions, and became himſelf an atheiſt. On his return to Bourges, his father engaged him in a courſe of reading, particularly of the New Teſtament, which inſenſibly reclaimed him from thoſe principles which he had imbibed at Lyons; and from this period he attached himſelf to ſtudies connected with ſacred literature and piety. In 1565 he was appointed miniſter of the Walloon church at Antwerp, where his labours were eminently uſeful in ſpreading the reformed religion, on account of which his father had been murdered a ſhort time before by the bigotted Catholics. Junius ſoon became obnoxious to the Inquiſition, which had been lately introduced into the Low Countries; and many attempts were made by the emiſſaries of that tribunal to get poſſeſſion of his perſon, which timely information enabled him to elude. In 1568 he was made chaplain to the prince of Orange, whom he accompanied during the unfortunate expedition to the Netherlands; and upon his return, he reſumed his miniſterial functions at Schoon, to which he had been before appointed by the elector palatine Frederic III. He was, after this, noticed by Henry IV. of France, and employed upon ſome public miſſions; which being accompliſhed, he accepted the divinity profeſſorſhip at Leyden, the duties of which he performed with ability and great reputation for the ſpace of ten years. He died of the plague in 1602, in the 57th year of his age. He was author of numerous works, theological, controverſial, and philological, of which the following may be mentioned: "Commentaries," on the firſt three chapters of Geneſis, the prophecies of Ezekiel, Daniel, and Jonah; "Sacred Parallels," and "Notes," upon the book of Revelation; "A Tranſlation out of Hebrew into Latin of the whole Old Teſtament;" "Hebrew Lexicon;" "Grammar of the Hebrew Tongue;" "Notes on Cicero's Epiſtles to Atticus."

JUNIUS, FRANCIS, ſon of the former, was born at Heidelberg in 1589, and was educated at Leyden. He was firſt intended for the military profeſſion, but circumſtances induced him to change his purpoſe, and he devoted himſelf entirely to letters. As a literary man, his firſt occupation was in collecting and publiſhing ſome of his father's works. In 1620 he came to England, and reſided in the family of Thomas earl of Arundel, as librarian, during the ſpace of thirty years. Being, it is ſaid, void of all ambition, and indifferent to the uſual objects of worldly purſuit, he made ſtudy the whole buſineſs of his life. His frequent viſits to the Bodleian and other libraries led him to obtain an intimate knowledge of books written in the Anglo-Saxon dialect. Convinced that in this he could diſcover the etymologies of all the tongues of northern Europe, he applied to it, and to the other dialects connected with it, with the greateſt aſſiduity. His final concluſion was, that the Gothic was the mother of all the languages of the Teutonic ſtem. In hopes of hearing the ancient Saxon ſpoken in its ancient purity, he went and reſided in Frieſland for two years. On his return through Holland, he met with the MS. of the four evangeliſts in ſilver Gothic letters, known by the name of the ſilver MS. This he ſet about explaining, and publiſhed it with a gloſſary, ſubjoining a verſion of the ſame in the Anglo-Saxon, with notes by Dr. Marſhall. He returned to England in 1674, and died at Windſor in 1677, at the age of eighty-eight. He bequeathed all his MSS. and collections to the public library at Oxford. His works are "De Pictura Veterum;" "Obſervationes in Willeromi Francicam Paraphras in Cantici Canticorum." But his great labour was a "Gloſſarium Gothicum," in five languages, compriſed in nine volumes. An "Etymologicum Anglicanum" was publiſhed from his papers, by the Rev. Edward Lye, in 1743. Bayle. Wood Ath. Ox.

JUNIUS, in *Geography*, a military townſhip of America, in Onondaga county, New York, at the N. end of Cayuga lake.

JUNIUS *Creek*, a northern branch of the Little Kanhaway, which interlocks with the weſtern waters of Monongahela river. See KANHAWAY.

JUNK, a river of Guinea, which runs into the Atlantic, N. lat. 6° 5′. W. long. 10° 5′.

JUNK, in *Sea Language*, a name given to any remnants or pieces of old cable, which is uſually cut into ſmall portions, for the purpoſe of making points, matts, caſkets, ſennit, &c.

JUNKS, large flat-bottomed veſſels, from 100 to 500 tons burden, uſed by the Chineſe. They have three maſts, and a ſhort bowſprit placed on the ſtarboard bow. The maſts are ſupported by two or three ſhrouds, which at times are all carried on the windward ſide. On the fore and main maſt is hoiſted a ſort of lug-ſail, made of cane or bamboo. Theſe ſails are confined by iron travellers, that encircle the maſt, and fixed to bamboos at ſeveral diviſions on the ſail. The ſail is kept to the wind by two ropes, faſtened to wood ſtirrups, fixed to the foot of the ſail, and lead to the maſt-head. The lee part of the ſail is hauled aft, by a rope that branches into ſhort legs, that are made faſt to each fold of the ſail. On the mizen-maſt is a gaff-ſail, made of coarſe cotton; a top-ſail made of the ſame is carried on the main-maſt; alſo a jib and ſprit-ſail, that are ſet on the bowſprit. Similar to theſe junks are the Japaneſe barks, which are 80 or 90 feet long on one deck, but have only one maſt, that carries a ſquare ſail, and forward one or two jibs made of cotton. They only uſe ſails when the wind is large.

JUNKER, CHRISTIAN, in *Biography*, was born at Dreſden in 1688. He ſtudied at Leipſic, was made firſt rector and librarian at Eiſenach, and hiſtoriographer to the prince of Saxony. In 1711 he was elected a member of the Royal Academy of Sciences at Berlin, and in 1713, director of the gymnaſium at Altenburg. He died in the following year through grief from the loſs of his wife, whoſe death preceded his own but five days. Of his literary talents he gave ſufficient proof by the many works which he publiſhed, and particularly by his "Geography of the

Middle Ages," in quarto. This work, which was publiſhed at Jena in 1712, is divided into two parts, and the whole concluded with a very uſeful index of all the countries, towns, villages, foreſts, rivers, and mountains known in the middle ages. His other principal works are, "Vita D. Mart. Lutheri et ſucceſſum Evangelicæ Reformationis," &c.; "Vita Jobi Ludolphi, accedunt Epiſt. aliquot clariſſ. virorum, nec non Specimen Linguæ Hottentotticæ;" "Principles of the Eccleſiaſtical Hiſtory of the Old and New Teſtament:" and "Lineæ primæ Eruditionis univerſæ Hiſtoriæ Philoſophicæ." Gen. Biog.

JUNKOWADA, in *Geography*, a town of Africa, in the kingdom of Yani; 22 miles W. of Piſania.

JUNKSEILON, or JUNK CEYLON, an iſland in the Eaſt Indian ſea, on the E. ſide of the bay of Bengal, belonging to Siam, and governed by a viceroy from that court. It derives its name, according to captain Forreſt, from a corruption of "Oojong Sylan," ſignifying, in the Malay language, point or promontory of Sylan, the S. point projecting a little way into the ſea. It ſtretches nearly N. and S. about 50 or 60 miles long, and is about 15 miles broad; its centre is ſituated in 8° N. lat. ſeparated from the continent of Malacca by an iſthmus of ſand, about a mile long and half a mile broad; which iſthmus is covered only at high water, and ſhuts up in the N. part an excellent harbour, called "Popra," with good anchorage round it, generally on a muddy bottom. The hills of this iſland are of moderate height; and inſtead of rivers, it has creeks, running into the ſea, through flat marſhes of mangrove trees from pleaſant brooks in the interior parts. The veſſels uſed by the inhabitants conſiſt of a few prows, about the ſize of Indiamen's long boats, and ſmall canoes, in which they ſail up the creeks to the cultivated plains in the middle of the iſland, abounding with rice fields. Beſides Popra, there is another capacious harbour on the S. W. part of the iſland. The place where ſhips generally anchor is in a good road, well ſheltered behind a ſmall iſland, joined at low water to the main land. In this iſland are 17 towns or villages, and the number of inhabitants is eſtimated at about 12,000. They have many elephants procured from Mergui, but no horſes; they have bullocks and buffaloes for labour,; wild hogs and deer; a few tame goats; no ſheep; domeſtic dogs and cats. They have ſome of the common poultry. The climate is agreeable, without extreme heat; the rain comes on gently in July, and continues, but not without frequent intermiſſions, till November, when fine weather ſucceeds, with very cool N.E. winds at night, favourable to the cultivation of vegetables. The opium, formerly ſold on this iſland in great abundance, was brought in Engliſh ſhips from Bengal, and purchaſed by thoſe who uſed Malay and Buggeſs prows: they ſold it by retail to the natives for tin, and exchanged it with the Bengal veſſels for opium, which they carried chiefly to Celebes and other Malay iſlands. The mixed cargo of the Malays was generally a chequered cloth, called Buggeſs cambays, made on the iſland of Celebes, painted cloths and painted handkerchiefs of Java, generally made from Hindooſtan long cloth, Java gongs, braſs pots, and other utenſils of braſs made in that iſland; China and Java tobacco; various porcelain; blue and white unbleached cloth called "kangan," and white and blue called "compow," brought from China by the junks that reſort to Siam, Macaſſar, Sooloo, Batavia, and other places. But the courſe of trade is much altered of late: opium being forbidden to the natives, the importation of it is prohibited, and a heavy duty is laid on the exportation of tin by orders from Siam; ſo that the trade has much declined. Hindooſtan piece goods, and ſome European articles, ſuch as iron, ſteel, lead, cutlery, and broad cloth, being almoſt the only imports. The trade of this iſland is conſiderable in ivory and tin. The exportation of tin is annually eſtimated at 500 tons. N. lat. 8°. E. long. 98° 20′.

The Birmans, wiſhing to obtain the entire dominion of the weſtern coaſt, as far as the territories of the Malay prince of Queedah, made an attempt, in 1785, to get poſſeſſion of this iſland. By ſo doing, they would have been able to monopolize the commerce of the peninſula, and prevent the Siameſe from communication with India by any other channel except the gulf of Siam. Beſides, the iſland was deſirable on account of its mild climate and luxuriant ſoil. Having fitted out a powerful armament of 11 ſhips and 8000 men, they attacked the fort, which is ſituated on the E. ſide of the iſland, and ſucceeded, notwithſtanding a ſpirited reſiſtance on the part of the Siameſe governor, who afterwards withdrew from the fort into the interior of the iſland. The triumph of the Birmans was of ſhort duration: the Siameſe governor rallied his forces, and drove the Birmans to their ſhipping with great loſs. Apprehenſive of greater diſaſters they returned to Mergui, whence the fleet ſailed for Rangoon, and the troops marched to Martaban. In the year 1786, the Birmans renewed their attack, and blocked up the harbour of Junkſeylon; but in the event they were completely routed by a powerful army of the king of Siam. Symes's Embaſſy to Ava, vol. i. See SIAM.

JUNO, in the *Heathen Mythology*, a goddeſs; the daughter of Saturn and Rhea, the ſiſter and wife of Jupiter: ſhe is otherwiſe called Lucina. According to Heſiod, ſhe was the mother of Hebe, Venus, Lucina, and Vulcan.

Juno, as well as Jupiter, had a great variety of characters among the ancients, but the favourite one of them all, among the Romans, was that of the Juno Matrona, dreſſed like the Roman matrons in a long robe which covered her from head to foot. The figures of the Roman empreſſes were often formed under this character of Juno. Such is the ſtatue of Sabina, at the Villa Mattei in Rome. This Juno was called indifferently, Juno Matrona and Juno Romana. The Juno Regina, and Juno Moneta, are always repreſented on the ancient gems and medals, in a very fine and magnificent dreſs, with the inſtruments of coinage, and under the latter appellation ſhe had a temple at Rome. We may obſerve, that Virgil, Æn. i. v. 17. and Æn. ii. v. 614, ſpeaks of Juno, not according to the appearance ſhe uſed to make among the Romans, but according to the repreſentations of her in other countries. In one place, where he deſcribes her arms and military chariot, he ſpeaks of the Carthaginian Juno; and in the other he has given her an angry and warlike figure, which belongs to the Juno Argiva, or ſome particular Juno of the Greeks. However, the Juno Soſpita, among the Romans, appears on ſeveral medals in a war chariot, and with a ſpear in her hand. She was called Soſpita, becauſe ſhe watched over the ſalubrity of the air, the intemperature of which is the cauſe of diſeaſes. Under this name ſhe had three temples, one at Lanuvium, and two at Rome: and Cicero informs us, that the conſuls, before they entered upon their office, were obliged to offer a ſacrifice to her. Another name of Juno was the "Queen," or "Regina," under which appellation ſhe had a ſtatue at Veii, that was tranſported to the Aventine mount, under the dictatorſhip of Camillus, where it was conſecrated by the ladies of the city. This ſtatue was held in ſuch reverence, that none but her prieſt could touch it. There was alſo a mild Juno, as well as a mild Jupiter, among the Romans: under which character, her face appeared more gentle and good-humoured than uſual: but the moſt obvious and ſtriking character of

Juno, which we derive from the writings of Homer and Virgil, is that of an imperious and haughty wife. Theſe poets oftener repreſent her ſcolding at Jupiter, than careſſing him. Nevertheleſs, ſhe was anciently conſidered as the great patroneſs of marriage and a wedded life. Under this character ſhe had the name of *Juga* and *Pronuba*, (Virgil, Æn. 4.) and had an altar in the ſtreet called Jugara. When ſhe preſided over women in childbed, and was confounded with Diana, ſhe obtained the name of Lucina, and was repreſented as a matron, holding a cup in her right hand, and a ſpear in her left, with this inſcription, "Junoni Lucinæ." Sometimes ſhe was repreſented ſitting on a chair, holding in her left hand a child in ſwaddling clothes, and in the right a flower reſembling a lily; and alſo a whip and a ſceptre, the whip ſignifying a happy delivery. Juno, under the character of preſiding over the air, is repreſented in a light car, drawn by peacocks, and attended by the Auræ, or nymphs of the air.

Of all the divinities of the Pagan world, there was not one whoſe worſhip was more ſolemn and more general than that of Juno. It was not confined to Europe alone, but found its way into Aſia, eſpecially into Syria; and alſo into Egypt, and other parts of Africa. Greece and Italy abounded with temples, chapels, or altars dedicated to this goddeſs, and in ſome places of diſtinction ſhe had ſeveral of theſe. Among the more celebrated towns, there were three that paid a more particular worſhip to Juno than others, *viz.* Argos, Samos, and Carthage. The prieſteſſes of Juno of Argos were highly reſpected in Greece; and their prieſthood ſerved to diſtinguiſh the principal eras of the Grecian hiſtory. Among the birds, the hawk was appropriated to her, and above all the peacock, which laſt was frequently an appendage to her ſtatues. According to Ælian (De Animal.), the Egyptians conſecrated to her the vulture. Dittany and the poppy were the plants which the Greeks offered to her, when they took her for Juno Lucina. Among the animals, the ewe-lamb was peculiarly conſecrated to her, and was the moſt common victim offered to her in ſacrifice. It was uſual, however, to offer to her a ſow on the firſt day of each month. We may infer the high veneration which was paid to Juno, eſpecially by the women, from this circumſtance, that their guardian deities were called "Junones," as thoſe of the men were denominated "Genii." Apuleius ſums up the honours that were paid to Juno in a comprehenſive manner, by informing us that ſhe was worſhipped as the "Queen of the Goddeſſes." See Jupiter, *infra*.

Juno the Aſſyrian was called *Aſtarte*, which ſee.

Juno, in *Aſtronomy*, the name given to one of the new planets by M. Harding the aſtronomer, who diſcovered it at Lilienthal, in Germany, the 1ſt September 1804. Two of theſe ſingular bodies, Ceres and Pallas, had before been diſcovered by Piazzi and others, and the great difficulty with which they are formed after they have been enveloped in the ſun's rays, ſuggeſted the taſk to Mr. Harding, of conſtructing a ſpecies of zodiac, to enable aſtronomers to find theſe two ſmall planets. In this zodiac he placed not only all the ſtars in the catalogues, but alſo all the ſmall ſtars which he himſelf could obſerve and place in the probable tract of the planets. It was in executing this laborious undertaking, that he perceived a ſmall ſtar which he thought had not been in the ſame place a ſhort time before. Three days afterwards it had evidently changed its place, and advanced towards the eaſt two degrees. A ſeries of obſervations ſoon convinced him that he had diſcovered a third planet of the ſame claſs as Ceres and Pallas.

Its orbit has been calculated by Mr. Gauſs and Mr. Burckhardt, as follows:

Seeberg, 1ſt Jan. 1805.

	Mr. Gauſs.				Mr. Burckhardt.			
Longitude	1^s	12°	$32'$	$36''$	1^s	12°	$17'$	$31''$
Aphelion	7	23	11	39	7	22	49	0
Node	5	21	4	16	5	21	6	0
Inclination		13	3	38		13	5	0
Diurnal motion				$815''.9595$				
Annual motion	2	22	43	45.2				
Excentricity			0	254236			0	.25096
Semi-axis Maj.			2	66445			2	657

The mean diameter of this planet, as ſeen from the earth, is, according to Schroeter, $3''.057$, but he differs in his opinion on this ſubject from Dr. Herſchel, who eſtimates it much ſmaller, and aſtronomers are at preſent unable to decide to which theory they ſhould incline.

Under the article Planets we ſhall again reſume the ſubject of theſe newly diſcovered bodies, and attempt to ſhew the ſtrong arguments that may be urged to prove that they are all fragments of a large planet which once circulated between Mars and Jupiter.

JUNOH, in *Geography*, a town of Hindooſtan, in Bahar; 35 miles N.E. of Nagpour.

JUNONES. See Genius.

JUNONIA, the name given at Rome to a feſtival inſtituted by the Greeks in honour of Juno, and by them called *Heræa;* which ſee.

JUNQUERA, La, in *Geography*, a ſmall town of Spain, in the province of Catalonia, ſituated at the entrance of a plain, which, as Strabo ſays, was fertile in flax and ſpart, or ſea-ruſh, whence it acquired the name of "Campus Juncarius," and the town that of "Juncaria." This town was eſtabliſhed by a colony of Maſſilians, and was formerly conſiderable; but is now much reduced. It has a pariſh church, but little trade. The environs abound with cork trees; 30 miles N. of Gerona.

JUNTA, called alſo *Junto*, and *Juncto*, a council, or company, of ſeveral perſons, meeting for the diſpatch of any buſineſs.

The term is particularly uſed in the Spaniſh and Portugueſe affairs. On the death of Charles II. king of Spain, the kingdom was governed, during the abſence of Philip V. by a junta.

In Portugal they have three conſiderable juntas: the junta of *commerce*, that of the *three eſtates*, and that of *tobacco.* The firſt was eſtabliſhed by king John IV.; this is a council of marine. The ſame king alſo aſſembled the ſtates of his kingdom, to create the tribunal of the junta of the three eſtates. King Peter II. created the junta of tobacco in 1675: it conſiſts of a preſident and ſix counſellors.

IVOIRE, in *Geography*, a town of France, in the department of the Leman; 13 miles N.N.E. of Geneva.

IVORY, (*Ebur,*) the tuſks or large conical teeth in the upper jaw of the elephant. This name is alſo ſometimes improperly given to the teeth of the ſea-unicorn (Monodon monoceros), the morſe (Trichecus roſmarus,) and thoſe of the Hippopotamus (ſee theſe articles).

The elephants' tuſks from Africa are in general preferred by the dealers in this article; they generally run conſiderably larger, but it is a common opinion, that the ivory from Ceylon is leſs liable to turn yellow when expoſed to the action of the atmoſphere, whence it is ſold at a higher price than the other. By far the greateſt part of this merchandize is brought from Africa; and a part of Guinea, which has furniſhed the greateſt quantity of it, has obtained the name of the Ivory Coaſt: the tract of coaſt from Cape Palmas, to Apollonia or Treſpunta, is more particularly known by this appellation. But the principal market for ſome time paſt appears to have been at the eaſt coaſt of Africa, where the ivory is ſuppoſed to be found of ſuperior quality; indeed the Engliſh merchants at Surat pay a greater price for the tuſks furniſhed by this part of the coaſt than for ſuch as are brought from any other part of Africa.

The beſt tuſks are theſe that are leaſt curved, without ſpots, and moſt ſolid towards the baſe. Some writers on this ſubject pretend that ſuch elephants as inhabit ſwampy places, generally produce blue, ſpongy, and knotty tuſks, in every reſpect inferior to thoſe of elephants living in hilly countries or on dry plains. The Ethiopian elephants' tuſks, according to Paul Lucas, are furniſhed with larger cavities, and are therefore leſs eſteemed.

In commerce, unwrought ivory paſſes under the appellation of marfil, or morfil, a word which Friſch derives from the Spaniſh, but is probably of Mooriſh or Indian origin. Tuſks under a certain weight (ſome ſay 14, others 20 pounds) are called *Crevelles* by the African merchants; a word which appears to be the ſame with *Eſcarballe*, or *Eſcarbeille* of the French, and *Scaravelios* of the Spaniards and Portugueſe.

Elephants' teeth conſtitute a very important article of commerce. Labat computed the quantity of ivory annually imported into France at his time, by the Senegal company, to be 500 quintals, or 50,000 pounds. In 1784 the number of tuſks imported into Nantes was 744, beſides 360 pounds weight; and into Havre de Grace, in the ſame year, 435 tuſks and 1805 pounds, and into Bourdeaux 5999 pounds. In the following year 3007 pounds and 471 tuſks were imported into Nantes; in 1787, 16,184 pounds and 395 teeth; and into Havre de Grace 3784 pounds.

In an account which the houſe of commons ordered to be given in, of the quantities of the principal articles in the nature of raw materials, imported and uſed in the manufactures of Great Britain for twelve years preceding the year 1799, we find the following reſpecting the importation of elephants' teeth; *viz.*

1788	1,387 cwt.
1789	2,145
1790	1,476
1791	3,735
1792	1,484
1793	1,412
1794	2,203
1795	1,047
1796	1,167
1797	1,969
1798	889

and in an account, likewiſe delivered to the houſe of commons, of the quantity of the ſame articles, on an annual medium of four periods of five years, each commencing the 5th of January 1772, the following related to the article under conſideration; *viz.* Five years preceding

5th January	1776	690 cwt.
	1787	1,339
	1792	2,050
	1799	1,291

The component parts of ivory being the ſame as thoſe of bones (*viz.* phoſphate of lime combined with a gelatinous ſubſtance), and differing only with regard to texture, hardneſs, and whiteneſs, the preparations it undergoes in the arts are equally applicable to the bones of animals. The whiteneſs which ivory acquires depends chiefly on the degree of dryneſs it has acquired. When yellow, its gelatinous matter is altered by the air, and appears to be combined with the oxygen of the atmoſphere. Oxygenated muriatic acid will reſtore it to its original whiteneſs. Thoſe employed in working ivory, diſtinguiſh the *white* and the *green*. The former is known by the whitiſh or lemon coloured rind of the tuſks, the other by the brown and blackiſh. The green ivory (ſo called from a greeniſh or faint olive colour pervading its ſubſtance) is preferred, it being of a cloſer texture, and known ſoon to exchange its green hue for the moſt beautiful white, which is leſs liable to turn yellow. This green ivory is, however, more brittle than the other.

Heat cannot be made uſe of for making ivory pliant, though it is rendered ſofter by being expoſed to that agent. It is divided by the ſaw; ſometimes (for delicate work) under water, in order to prevent its being heated or rent in the operation. It is poliſhed with pumice and tripoli. Ivory has been ſaid to become ſoft by being placed in muſtard; but that end is attained with greater certainty by ſteeping it in ſome diluted mineral acid. Both ivory and common bones become alſo ſoft by being immerſed in an alkaline lye made of ſoda and quick lime.

By burning this ſubſtance in cloſed veſſels, and afterwards levigating it with water on a porphyry ſlab, we procure what is called *black ivory*, much uſed for painting and other purpoſes that require a very intenſe velvet-like black colour.

The following obſervations, relative to the nature of the tuſks of elephants, are extracted from Cuvier's excellent memoir "On living and foſſil Elephants," in the Annales du Muſeum, and tranſlated in the Philoſophical Magazine, vols. xxvii. xxviii. and xxix. to which, eſpecially as our article ELEPHANT was written previous to the publication of that elaborate memoir, we refer our readers for a more complete natural hiſtory of that remarkable animal.

Cuvier, in examining the varieties of tuſks, and the differences remarked in this reſpect among elephants, obſerves, that their texture exhibits no important difference. It always preſents, upon its tranſverſe ſection, thoſe ſtreaks which proceed like an arc of a circle from the centre to the circumference, and form, in growing, curvilinear lozenges which occupy the whole diſk, and which are more or leſs broad, and more or leſs perceptible to the eye. This character, common to all elephant ivory, and depending immediately on the pores of their pulpy nucleus, is not to be found in the tuſks of any other animal. It is to be ſeen in all foſſil tuſks, and it refutes the opinion of Leibnitz, adopted by ſome other writers, and even by Linnæus, that the mammoth horns might have belonged to the Trichecus roſmarus. The tuſks of theſe animals, however, ſeem wholly compoſed of ſmall round accumulated grains.

The ſize of tuſks varies according to the ſpecies, ſexes, and varieties; and as they are growing all their lives, age, more than any thing elſe, influences their dimenſions. The African elephant, as far as we are able to aſcertain, has very large tuſks in both ſexes. The African female, 17 years old, the ſkeleton of which is in the muſeum of Paris, has larger tuſks than any male or female Indian elephant of the ſame ſize that we are acquainted with. It is from Africa we receive the moſt ivory, and the greater number of tuſks; and they are alſo harder and whiter than any others. But our limited knowledge is confined to the elephants of the weſtern coaſts, and to thoſe of the ſouth of Africa. We are ignorant if thoſe of the eaſtern ſhores reſemble them in every thing, and if there be any varieties in the interior. We know from Pennant, however, that the coaſt of Moſambique furniſhes tuſks ten feet long; being the largeſt ever known. In the Indian ſpecies there are more varieties of tuſks, which Mr. Corſe has developed with more care than any other writer (ſee Phil. Tranſ. 1799, and art. ELEPHAS;) but all theſe varieties have nothing conſtant, and are mixed indiſcriminately with each other. In Bengal, the tuſks weigh little more than 72 pounds, and they do not exceed 50 in the province of Tipperah, which produces the beſt elephants. There are tuſks in London, however, probably from Pegu, which weigh 150 pounds. It is, in fact, from Pegu and Cochinchina that the largeſt elephants and tuſks of the Indian ſpecies come. The coaſt of Malabar furniſhes no tuſks, according to Pennant, more than four feet long.

Cuvier has drawn up the following table of the length, diameter, and weight of the largeſt tuſks taken from other authors, or actually inſpected by himſelf: the tuſks from Africa are not diſtinguiſhed here from thoſe of India.

Authors who have quoted the Facts.	Their Authorities and Details upon the Origin of the Tuſks.	Length following the Curvature.	Diameter at the thick End.	Weight.

As the tuſks, M. Cuvier adds, grow during the life of the animal, and the body does not, the ſize of an elephant cannot be concluded from its tuſks, even by eſtabliſhing the proportion between individuals of one ſame variety, and the ſame ſex: as, on the other hand, the tuſks rot or break at their points, according to the greater or leſs uſe the animal makes of them, and they are ſharpened, more or leſs abruptly, into a point, we cannot conclude their length from the diameter at their baſe. Finally, their weight cannot be concluded from their dimenſions (Meſſerſchmidt in the Phil. Tranſ.), becauſe their cavity at the baſe may be more or leſs filled. The degree of curvature of the tuſks of elephants varies almoſt as much as their ſize. In various cabinets there are ſeveral tuſks to be ſeen with curvatures more or leſs ſtrange, and in particular ſome are ſpiral. Camper ſaw ſeveral of them in the Britiſh Muſeum, and Grew repreſents one which is turned round ſeveral times; and Cuvier knows, from M. Fabroni, that there is one of that deſcription in the Florence cabinet alſo. They are frequently ſeen in the form of an Italic *S*, &c.

A green dye may be given to ivory, by ſteeping it in aquafortis, tinged with copper or verdigris, or in two parts of verdigris and one of ſal ammoniac, ground well together, with ſtrong white-wine vinegar poured on them: and by converting the aqua-fortis into aqua regia, by diſſolving a fourth part of its weight of ſal ammoniac in it, ivory may be ſtained of a fine purple colour.

Ivory, bone, horn, and other ſolid parts of animals, may be ſtained black, in the ſame manner as wood. Theſe ſubſtances may be ſtained yellow, by boiling them firſt in a ſolution of one pound of alum, in two quarts of water; and then, having prepared a tincture of the French berries, by boiling half a pound of the berries, pounded, in a gallon of water, putting them into this tincture, after it has boiled about an hour, and letting them remain there half an hour. Turmeric root may be uſed inſtead of the berries; but in this caſe the ivory, &c. muſt be dipt in alum water after it is taken out of the tincture. Ivory, &c. may be ſtained blue, by firſt ſtaining it green, and then dipping it in a ſolution of pearl aſhes made ſtrong, and boiling hot: or it may be otherwiſe boiled in the tincture of indigo, prepared by the dyers; and afterwards in a ſolution of tartar, made by diſſolving three ounces of white tartar, or cream of tartar, in a quart of water. For other proceſſes and colours, ſee DYEING *of Bone*, &c. *Colouring and Staining of* BONE, and TORTOISE *Shell.*

Ivory may be prepared as a ground for miniature painting, by cleanſing the ivory leaves or tables, and rubbing them over with the juice of garlic. This is ſaid to be more eſſential for taking off the greaſineſs, which prevents the colours from fixing on the ground, than ſoap or gall. Ivory has the ſame medical virtues with hartſhorn; its ſhavings too, like thoſe of hartſhorn, boil into a jelly with water, and have the ſame reſtorative quality. See HARTSHORN.

IVORY *Black.* See *Ivory* BLACK.

IVORY, *Foſſil,* in *Natural Hiſtory.* It is not uncommon in the moſt modern alluvial ſoils, like the vallies in the baſin of Paris, mentioned by Cuvier and Brogniart, and the ſoil in which the docks adjoining the Thames were excavated, to find the bones, teeth, and tuſks of elephants; and this foſſil ivory is not, in ſome inſtances, much altered, though in general it has loſt its conſiſtence in a great meaſure, and readily ſcales off in concentric rings, and in others is impregnated with metallic ſubſtances, ſo as to imitate, if not form the Turquoiſe ſtones, the Callais of Pliny, &c. as Dr. Woodward has ſhewn in his Letters on the Method of Foſſils, p. 15. It may, however, be doubted, we believe, whether foſſil ivory has ever been found imbedded in the ſtrata, or the parts of any dry-land animals, numerous as their remains are in the laſt alluvial covering of ſome diſtricts The abundance of elephants' teeth found buried in different parts of the world, and many of thoſe parts ſuch as no elephant is ever known to have lived in, have given amazement to naturaliſts.

The long tuſks, which are what we call ivory, are the only teeth the vulgar are acquainted in this creature; yet even theſe, in their foſſil ſtate, have often been miſtaken for horns, or other animal parts. The grinders of this animal are ſo enormouſly large, and of ſo ſingular a ſhape, that it requires ſome knowledge in natural hiſtory to diſcover them at ſight, and many have miſtaken them, when imperfect, for parts of a petrified ſhell-fiſh of the nautilus kind, their root being hollowed all along, and armed with an indented ridge on each ſide, in the manner of the back parts of ſome ſhells of that and of the Cornu ammonis kind.

We are not to wonder that the teeth of elephants are found more frequently than any other bones of the animal, ſince their uſe in the creature required that they ſhould be harder than any other bone, and that hardneſs has preſerved them in places where the other bones have periſhed. The different ſtate in which theſe teeth are found, is wholly owing to the different juices abounding in the earth in the place where they were depoſited, ſome of thoſe juices being of power to preſerve, others to deſtroy them; ſome eating them inſenſibly away, ſome as it were calcining them by ſlow degrees, and others rendering them greatly more hard and durable than before. Mem. Acad. Par. 1727.

Count Marſigli, and ſome other writers, have thought it an eaſy ſolution of the queſtion of the teeth and bones of elephants being found in countries where elephants are not naturally found, that we owe them to the Romans, who, bringing them over for their uſe in war, buried them wherever they happened to die. But ſir Hans Sloane expreſſes himſelf very juſtly againſt this opinion: he obſerves, that of the remains of elephants found in Europe, nothing is ſo common as the ivory tuſks. Now, as he well obſerves, the Romans held ivory in the higheſt eſteem, and it ſold among them at a great price; wherefore, had they been the buriers of the elephants, they would certainly have taken away the ivory tuſks firſt. It is certain, therefore, that accident, and not deſign, hath buried theſe bones, and that accident can have been no other than ſome prodigious inundation. Woodward is deſirous of making the univerſal deluge to have done all this, but that ſeems not neceſſary to be ſuppoſed in every caſe. Sir Hans Sloane gives an enumeration of the moſt curious of theſe pieces of foſſil ivory, which his own cabinet contained, and of ſome others of the moſt remarkable, mentioned by authors; from which we may form a very diſtinct idea, both of the nature of the bodies themſelves, and of the places where they are uſually met with. See Philoſ. Tranſ. N° 403. p. 458.

The power of ſubterranean calcinations to render things of this kind brittle, is remarked by the ſame author from Moreton's Hiſtory of Northamptonſhire, in the inſtance of a foſſil tuſk of an elephant, which was in the whole at leaſt ſix feet long, and had preſerved its natural whiteneſs, though rendered ſo brittle as to fall into ſeveral pieces in the digging. This was dug up near Little Bowden, in Northamptonſhire; and the ſtrata of the place where it lay were as follows: 1. Vegetable mould, 14 inches. 2. Loam, a foot and a half. 3. Large pebbles, with a ſmall mixture of earth among them, two feet and a half. 4. Blue clay; in the upper part of this laſt ſtratum the tooth was found.

Sir Hans mentions another elephant's tuſk very entire and ſound, found in Siberia. The like are common in Siberia and many parts of Ruſſia, and are ſo little injured, that they are uſed as ivory, and are ſuppoſed to be the teeth of a vaſt animal called the *mammoth*, which they think lives under ground. Phil. Tranſ. N° 468. See farther on this ſubject, BONES, *Foſſil*, ELEPHANTS' *Bones*, and TEETH, *Foſſil.*

IVORY *Coaſt*, in *Geography*, a name given to a country of Africa, ſituated on the coaſt of the Atlantic, between Cape Apollonia to the E. and Cape Palmas to the W. The principal towns and villages are Groua, or Grua, Great Tabo, Little Tabo, Grand Drewin, Batrou, Laho, Apolonia, and Valfo. Theſe lie at the mouths of rivers, whence they derive their names. The interior of the country is little known, as the natives do not allow the Europeans to eſtabliſh ſettlements, or even to trade among them, except very cautiouſly, by means of the coaſt negroes. The chief commodities are gold, ivory, and ſlaves. The inhabitants are reckoned ſavage, and in a high degree jealous and ſuſpicious; inſomuch that in their traffick with the Europeans, they are artful and impoſing, and ſo eaſily incenſed and alarmed, that they will precipitate themſelves into the ſea from the European ſhips, and ſwim to their canoes.

The whole coaſt, if we except a few capes, from Cape Palmas to Cape Apollonia, is ſo low and ſtraight, that it furniſhes no diſtinct land-marks beſides the heights and mountains round Drewin. The landing is every where dangerous, on account of the ſwelling waves and high ſurfs; and the negroes, who are acquainted with this ſea, are the only people that can combat with the fury of its winds, tides, and waves, in their little canoes. From Cape Palmas to Cape Apollonia, theſe canoes are employed in loading and unloading our ſhips, that dread coming near the ſhore. Every country within the limits of the Ivory Coaſt is fruitful in rice, peaſe, beans, gooſeberries, citrons, oranges, and cocoa-nuts, beſides ſugar-canes. Upon the whole, the Ivory Coaſt is reckoned one of the fineſt diviſions of Guinea: the mountains and vallies, filled with villages, which are ſurrounded with lofty palms and cocoa-trees, preſent a delightful proſpect. The ſoil of the high land is a reddiſh earth, which, with the perpetual verdure of the trees, forms an agreeable mixture of colours. Cotton and indigo are the ſpontaneous growth of the provinces of Great Drewin and St. Andrew, which are the richeſt of the whole. Palm wine and oil are plentiful; together with a ſpecies of fruit, growing on a ſort of palm-tree, which the natives call tombo, or bourbon. This the negroes eat with great pleaſure, drinking at the ſame time a wine, drawn from the ſame tree, mixed with water. All ſorts of tame animals, ſheep, cows, goats, and hogs, are ſo numerous, that they are ſold almoſt for nothing. The coaſt affords great variety and abundance of fiſh. As to the people, they are rather above the common ſtature, clean-limbed and well proportioned; but their features on the firſt glance are hideous; yet when the firſt impreſſion is removed, Villault and Der Marchais concur in repreſenting them as the moſt rational, civilized, and poliſhed people in all Guinea. This account, however, is reſtricted to the natives of the Quaqua coaſt, that is, from the river Drewin to cape Apollonia; for as to the others, all authors deſcribe them as the moſt barbarous, cruel, and ſavage of all nations. Drunkenneſs is a crime of ſo odious a nature among the moſt civilized, that the laws have prohibited it under the ſevereſt penalties, and on pain of death. Their diet is coarſe and indelicate. Their teeth are ſharp, as they are in the conſtant habit of pointing them, and in general they are crooked and irregular. Long nails and a quantity of hair are deemed very ornamental. They are much addicted to the chewing of betel, with the juice of which they moiſten the neck and chin, under a notion, that it gives a fine varniſh and beautiful luſtre to the ſkin. Round the ſmall of the leg they wear large and heavy rings of iron, to which are appended bells, with the tingling ſound of which they are moſt delighted; and the multitude of theſe, as they imagine, conſtitute their dignity and grandeur. The common people only wear a piece of cloth round the waiſt, from a regard to decency; but perſons more opulent cover themſelves with a ſort of cloak or ſurplice, with long ſleeves, which they wrap round the ſhoulders, and hang down below the knee; and by their ſides they wear hangers or ſhort ſwords. Some of the women, who do not part with their hair to the men, adorn it with little plates of pure gold; and they are fond of coſtly trinkets. Their dreſs is a cloth, which falls over the fore-part of their bodies, the hinder parts being left naked; and indeed there are hardly any people on the whole coaſt of Guinea ſo primitive and ſimple in this particular, as the natives of the Ivory Coaſt, and particularly of Quaqua. Their form of ſalutation they have in common with all negroes; that of laying hold of the fingers, making them crack, and repeating the word "quaqua" ſeveral times in a low voice. It is a conſtant rule among them, that the ſon follows the profeſſion of the father, whatever it may be. In the mechanic arts they are ſingularly inexpert; a common door-lock is reckoned a great curioſity; a watch excites ſtill higher admiration; and making paper ſpeak, as they expreſs it, is a perfect miracle. Their religion, like that of the people on the Gold Coaſt, is wholly founded in ignorance and ſuperſtition. They entertain great reverence for their princes and prieſts; and they are fully perſuaded, that magic and ſorcery are powers inſeparable from majeſty and prieſthood. The natives of Quaqua cultivate ſeveral branches of trade with aſſiduity; and crowd on board any ſhips that approach their coaſt with all the produce of their country, gold, ivory, proviſion, and ſlaves. The European factors are much amuſed with obſerving canoes filled with men crowding round them, whilſt every mouth utters the ſame ſound, quaqua, quaqua, which ſeems to be a word by which they expreſs welcome. The negroes of Quaqua, however, are timorous and jealous in their intercourſe and traffic with Europeans. The uſual trade carried on in this part of the coaſt conſiſts of cotton cloths, ivory, gold, and ſlaves. The maritime negroes act as brokers to the inland negroes, ſell their ſtuffs for them, and receive ſo much *per cent.* by way of commiſſion. The Quaqua negroes manufacture a kind of plant, reſembling hemp, into a ſtrong cloth, to which they give beautiful colours, and pleaſing flowers and deſigns that indicate them to be no bad artiſts in their way. They have alſo a conſiderable trade in ſalt with their inland neighbours, to whom they ſell it at a very high price, on account of the diſtance and expence of carriage. All the countries behind Quaqua furniſh large ſtore of elephant's teeth, the moſt beautiful ivory in the world. This is conſtantly bought up as ſoon as it is brought to the coaſt by the Engliſh, Dutch, French, and ſometimes by the Danes and Portugueſe. Villault infers from the quantity of pure gold which the women wear for ornament, that the inland country has mines that furniſh virgin native gold. The European commodities which the negroes accept moſt readily in exchange for their own, are ſuch as are held in eſtimation in other parts of Guinea; with this difference, that here the bracelets and rings for the legs, either of copper or iron, muſt be of an intolerable weight.

Although the Ivory Coaſt be divided into a variety of petty ſtates or kingdoms, yet they have ſcarcely any ſeparate intereſts; for among themſelves war ſeldom happens, and of conſequence, the ſlave trade here has borne but a ſmall proportion to that traffic on the Gold and Slave Coaſts.

Authors have obſerved, that the exomphalus, hernia umbilicalis, or preternatural tumour of the abdomen at the navel from a rupture, is a diſorder extremely common on the Ivory Coaſt; though they are unable to account for its prevalence. Other deformities are as rare as this is common. Mod. An. Hiſt. vol. xiv.

JUPARITUBACA, a river of Brazil, which runs into the Atlantic, S. lat. 11° 10′.

JUPITER, a river of the iſland of Anticoſti, which runs into the river St. Lawrence, N. lat. 49° 25′. W. long. 63° 42′.

Jupiter, or Jove, in the *Heathen Mythology*, the ſovereign god of the heathens; the ſon of Saturn and Rhea; born in the iſland of Crete, at the ſame birth with Juno; he married Juno, expelled his father out of his kingdom, and divided the kingdom of the world with his brethren. Under ſeveral ſhapes he is ſaid to have played many wanton pranks; ſo that, according to poetic fiction, he filled heaven with his natural children.

The philoſophers, as we learn from Cicero's diſcourſes on the nature of the gods, took Jupiter only for the more purified air, or the ether, and Juno, his wife, for the groſſer air that ſurrounds our earth. Thoſe who regarded him as an animated god, or one of thoſe men, who, for their illuſtrious actions or uſeful inventions, were raiſed to divine honours, after having conſidered him as the ſovereign of gods and men, or as an almighty god, who, by the mere movement of one of his eye-brows, made Olympus tremble, degraded him afterwards by aſcribing to him the moſt unworthy actions and the moſt enormous crimes; he is, according to them, guilty of inceſt and adultery, an ungrateful ſon, a faithleſs huſband, choleric, paſſionate, and revengeful. Whence, we may naturally inquire, did the Greeks and Romans, renowned for their genius and philoſophy, derive ſuch ideas of their ſupreme divinity? They were the poets, it is ſaid, who gave ſuch a repreſentation of their Jupiter; but they muſt have borrowed it from the prevalent theology of the times. However, the hiſtory of this god is perplexed by the number and variety of perſons, to whom the name has been applied. We may obſerve, that the hiſtory of Jupiter, who was beſt known, is that of him, who had been king of Crete, and this hiſtory is filled up with the adventures of all the reſt. The ancients are not agreed with reſpect to the number of thoſe, to whom the appellation of Jupiter was applied. Diodorus Siculus reckons only two; one, who was the prince of the Atlantidæ, and the other, ſuppoſed to be his nephew, who became much more famous, and was king of Crete, the limits of whoſe empire extended to the extremities of Europe and Africa. Cicero admits three; two from Arcadia, one the ſon of Æther, and father of Proſerpine and Bacchus, and the other, the ſon of Cælus, and father of Minerva, who is ſaid to have invented war, and to have preſided over it; and a third, the ſon of Saturn, born in Crete, where, ſays Cicero, his tomb is ſtill to be ſeen. The moſt ancient of theſe, who bore the name of Jupiter, is ſaid to have been Jupiter Ammon of the Lybians. (See AMMON.) Jupiter Serapis, worſhipped alſo in Egypt, is very ancient. (See SERAPIS.) Jupiter Belus claims high antiquity; he is ſaid to have had a temple at Babylon, and was, according to Herodotus, the Jupiter of the Aſſyrians. (See BELUS.) Jupiter of Thebes has been ſuppoſed by ſome to have been Ammon, and by others Oſiris. (See OSIRIS.) The Scythians, the Ethiopians, and ſeveral other nations, had their reſpective Jupiter. Indeed, it is impoſſible to give a compleat liſt of all who bore that name, ſince, according to Varro and Euſebius, they amounted to 300. Beſides, all the gallantries that are aſcribed to Jupiter of Crete, and which, according to the poets, laſted 400 years, cannot belong to one and the ſame perſon. Jupiter of Crete, having baniſhed his father Saturn, and overthrown the Titans and Giants, determined to make his ſubjects happy. According to Heſiod, he was ſeven times married, and the laſt of his wives was Juno. His true name is ſaid to have been "Jou," ſignifying young, to which was afterwards added the appellation of "Pater," father, whence was derived Joupater and Jupiter. Others derive Jupiter from Juvan, or Juvans Pater. The Greeks call this god Zeus. The deſignation of father was intended to point out his ſuperiority over the other gods, which was alſo expreſſed by the epithets "Optimus Maximus." Jupiter, having become maſter of a vaſt empire, married his ſiſter, named by the Latins Juno, and by the Greeks Hera; and as he found it difficult to govern dominions of ſo wide an extent, he diſtributed them into different provinces. Accordingly we learn from Diodorus Siculus, that Atlas governed the frontiers of Africa. The ancients alſo inform us, that Pluto was appointed governor of the weſtern parts of the empire of the Titans, of the Gauls, and Spain; which government was afterwards transferred, upon Pluto's death, to Mercury, who, having ſignalized himſelf, became the great divinity of the Celtæ. Jupiter reſerved to himſelf the whole eaſt; that is, Greece, the Iſles, and that part of Aſia whence his anceſtors had ſprung. Thoſe of the ancients who wrote the hiſtory of Crete, extolled Jupiter for his prudence, valour, and juſtice, and for other civil and military virtues; and from theſe hiſtorians, whoſe works are now loſt, the Greek authors are ſaid to have taken the accounts they have given us of this prince. Oppreſſed with old age, after many adventures which ought to have been aſcribed to other princes who bore his name, he died in Crete, where his tomb was, for a long time, ſeen near Gnoſſus, one of the principal cities of the iſland, with this epitaph, "Here lies Zan who was called Jupiter." He lived to 120 years, having reigned 62 years from the defeat of the Titans and the death of Saturn. Banier reckons his reign to have begun 1842 years B.C., and to have terminated at his death 1780 years B.C. After his death his dominions were divided into ſeveral petty kingdoms; of which we have no account. The poets embelliſhed the ancient traditions, probably in part true, and in part falſe, with a great variety of fabulous circumſtances, which beſt ſuited the age and country in which they lived, and the purpoſes for which they wrote; and it would be endleſs to give a minute detail of the various fables which their luxuriant fancy created. Perhaps, in the better and more approved mythology, Jupiter might repreſent the ſupreme god, who governed at once heaven, earth, and hell. (See Pauſanias in Corinth. c. 24.) The various names by which this deified Jupiter, who was the great divinity of the Pagan world, and who was univerſally worſhipped from Egypt to the centre of Spain, was diſtinguiſhed, were derived from the places where he was worſhipped, or from ſome circumſtances that gave riſe to the temples, chapels and altars that were conſecrated to him; but it is needleſs to recount them. Many of them occur in the ſequel of this article, and make ſeparate heads in the Cyclopædia. Of all the gods of Paganiſm, whether they were derived from the elements of nature or from ſome eminent perſons, who were raiſed to this rank, the Jupiter ſeems to have been pre-eminent, and of courſe his worſhip was the moſt ſolemn, and attended with the greateſt variety of ceremonies. The moſt common victims offered to this god were the ſhe-goat, the ſheep, and the white bull, whoſe horns they took care to gild. In ſeveral caſes they had no victim, but made him an offering of flour, ſalt, and incenſe, eſpecially at Rome; at Athens, they ſacrificed an ox; and when he repreſented Jupiter the avenger, the ſacrifice of atonement preſented to him was a ſhe-goat. He had a temple at Rome, under that name, near the Capitol, where he was repreſented with arrows in his hand, to denote that he was ready to execute vengeance upon crimes. Among the trees, the oak and the olive were conſecrated to him. None worſhipped him more religiouſly, if we may believe Cicero, than the Roman ladies; "A Matronis Romanis caſtiſſima cultus" ſays that author. (De Nat. Deor. l. i.) Jupiter's three oracles, that of Dodona, that of Trophonius, and that which he had in Libya, were famous. See ORACLE.

As mankind are directed by an internal ſpirit or mind, the univerſe alſo is governed by an over-ruling intelligence; which, as the cauſe and preſerver of all animal beings, was called Ζεὺς ὁ Ζῶν. See GOD.

The heathens in general believed that there was but one ſupreme God; but when they conſidered this one great being as influencing the affairs of the world, they gave him as many different names; and hence proceeded their variety of nominal gods. When he thundered or lightened, they called him Jupiter; when he calmed the ſea, Neptune; when he guided their councils, Minerva; and when he gave them ſtrength in battle, Mars. In proceſs of time they uſed different repreſentations of this Jupiter, &c. and conſidered them, vulgarly at leaſt, as ſo many different perſons. They afterwards regarded each of them in different views: *e. g.* the Jupiter that ſhowered down bleſſings, was called the *Kind* Jupiter: and when puniſhing, the *Terrible* Jupiter. There was alſo one Jupiter for Europe, and another for Africa; and in Europe, there was one great Jupiter who was the particular friend of the Athenians, and another who was the ſpecial protector of the Romans: nay, there was ſcarcely a town or hamlet perhaps, in Italy, that had not a Jupiter of its own; and the Jupiter of Terracina or Jupiter *Anxur*, repreſented in medals as young and beardleſs, with rays round his head, more reſembled Apollo than the great Jupiter at the Capitol. In this way Jupiter at length had temples and different characters almoſt every where: at Carthage, he was called Ammon; in Egypt, Serapis; at Athens, the great Jupiter was the Olympian Jupiter; and at Rome, the greateſt Jupiter was the Capitoline Jupiter, who was the guardian and benefactor of the Romans, and whom they called the beſt and greateſt Jupiter, "Jupiter optimus maximus." The figure of this Jupiter was repreſented in his chief temple on the Capitoline hill, as ſitting on a curule chair, with the fulmen or thunder, or rather lightning, in one hand, and a ſceptre in the other. This fulmen in the figures of the old artiſts was always adapted to the character under which they were to repreſent Jupiter. If his appearance was to be mild and calm, they gave him the conic fulmen or bundle of flames wreathed cloſe together, held down in his hand. When puniſhing, he holds up the ſame figure, with two tranſverſe darts of lightning, ſometimes with wings added to each ſide of it, to denote its ſwiftneſs: this was called by the poets, the three-forked bolt of Jove: and when he was going to do ſome exemplary execution, they put in his hand a handful of flames, all let looſe in their utmoſt fury; and ſometimes filled both his hands with flames. The ſuperiority of Jupiter was principally manifeſted in that air of majeſty which the ancient artiſts endeavoured to expreſs in his countenance: particular attention was paid to the head of hair, the eye-brows, and the beard. There are ſeveral heads of the mild Jupiter on ancient ſeals, where his face has a mixture of dignity and eaſe in it, admirably deſcribed by Virgil, Æn. i. v. 256. The ſtatues of the Terrible Jupiter were generally of black marble, as thoſe of the former were of white: the one ſitting with an air of tranquillity; the other ſtanding, more or leſs diſturbed. The face of the one is pacific and ſerene; of the other angry or clouded. On the heads of the one the hair is regular and compoſed; in the other, it is ſo diſcompoſed, that it falls half-way down the forehead. The face of the Jupiter Tonans reſembles that of the Terrible Jupiter: he is repreſented on gems and medals as holding up the triple bolt in his right hand, and ſtanding in a chariot, which ſeems to be whirled on impetuouſly by four horſes. Thus he is alſo deſcribed by the poets. Ovid. Deian. Herc. v. 28. Horace, lib. i. od. 34. v. 8. Jupiter, as the intelligence, preſiding over a ſingle planet, is repreſented only in a chariot and pair: on all other occaſions, if repreſented in a chariot, he is always drawn by four horſes. Jupiter is well known as the chief ruler of the air, whoſe particular province was to direct the rains, the thunders, and the lightnings. As the diſpenſer of rain, he was called Jupiter Pluvius; under which character he is exhibited ſeated in the clouds, holding up his right hand, or extending his arms almoſt in a ſtraight line each way, and pouring a ſtream of hail and rain from his right hand on the earth; whilſt the fulmen is held down in his left. The wings that are given to him relate to his character of preſiding over the air: his hair and beard in the Antonine pillar are all ſpread down by the rain, which deſcends in a ſheet from him, and falls for the refreſhment of the Romans; whilſt their enemies are repreſented as ſtruck with the lightnings, and lying dead at their feet. Spence's Polymetis, p. 46. 182, and 210, &c.

JUPITER, in *Aſtronomy*, the largeſt of the planets of the ſolar ſyſtem; his diameter being 11 times greater than that of the earth, or 89,170 Engliſh miles. Its revolution on its axis is performed in 9 hours, 55 minutes, and 37 ſeconds. This planet moves from weſt to eaſt in a period of 11 years, 318 days, 14 hours, 27 minutes, 10.7 ſeconds. Its ſynodical revolution is about 399 days. Before its oppoſition with the ſun, and at about 115° from it, its motion becomes retrograde, and its velocity continually augments till the moment of oppoſition, after which it diminiſhes, and when at about 115° from the ſun, its motion changes from retrograde to direct. The duration of this retrograde motion is about 121 days, and the arc of retrogradation about 10 degrees: and it may be obſerved as a general rule with the ſuperior planets, that the farther they are from the ſun, the leſs is their arc of retrogradation; but the longer time is taken in deſcribing it, for were the diſtance of planets indefinitely great, the arc of retrogradation would be extremely ſmall, and its retrograde motion would laſt half a year, reſembling the effect of parallax of a fixed ſtar, if ever this ſhould be rendered ſenſible to our inſtruments.

Jupiter is, next to Venus, the moſt brilliant of the planets, and ſometimes even ſurpaſſes it in brightneſs. Its apparent diameter is greater at the oppoſitions, and is then equal to nearly 48″; its mean equatorial diameter is eſtimated at 38.8″. Its figure is an oblate ſpheroid, the proportion of its equatorial to its polar axis being about 14 to 13. La Place from theory deduces this proportion to be 1,000,000 to 9,286,922, a reſult obtained from computing the effect of the equatorial regions of the planet in diſturbing the nodes of the ſatellites. Almoſt every perſon is ſufficiently acquainted with the teleſcopic appearance of Jupiter, to know that its ſurface is remarkable for being always covered with a number of belts or ſtripes of various ſhades. Theſe appearances differ much at different times, and even at the ſame time in teleſcopes of different powers. Uſually theſe belts ſeem to be of an uniform tint; but in very favourable weather, they ſometimes appear to conſiſt of a number of curved lines, like the ſtrokes of an engraving. *Figs.* 143, 144, 145, 146. *Plate* XVI. *Aſtronomy*, repreſent four views of this planet, as given by Dr. Herſchel and Mr. Schroeter.

Theſe belts were firſt obſerved at Naples by Zuppi and Bartoli, two Jeſuits; and about the year 1660, they were obſerved by Campani, with refracting teleſcopes of his own conſtruction, and not much inferior in diſtinctneſs to thoſe of the preſent day; the great modern improvement in refracting teleſcopes, conſiſting rather in the reduction of their ſize than in the increaſe of their magnifying power.

Jupiter is accompanied by four ſatellites, which were diſcovered by Galileo, the 8th of January 1610. He at firſt took them for teleſcopic fixed ſtars; but continued obſervation ſoon convinced him that they really accompanied the planet. The relative ſituation of theſe ſmall bodies changes at every inſtant: they oſcillate on each ſide the planet; and it is by the extent of theſe oſcillations that the rank of theſe ſatellites is determined; that being called the firſt ſatellite, whoſe oſcillation is the leaſt. They are ſometimes ſeen to paſs over the diſc of the planet, and project a ſhadow in the form of a well-defined black ſpot, which then deſcribes a chord of this diſc.

Jupiter and his ſatellites, therefore, are opaque bodies, enlightened by the ſun; and when the latter interpoſe between the ſun and Jupiter, they produce real ſolar eclipſes, preciſely ſimilar to thoſe which the moon occaſions on the earth.

This phenomenon leads to the explanation of another which the ſatellites preſent. They are often obſerved to diſappear, though at ſome diſtance from the diſc of the planet: the third and fourth re-appear ſometimes on the ſame ſide of the diſc.

The ſhadow which Jupiter projects behind it, (relatively to the ſun,) is the only cauſe that can explain theſe diſappearances, which are perfectly ſimilar to eclipſes of the moon.

The circumſtances which accompany them leave no doubt of the reality of this cauſe. The ſatellites are always obſerved to diſappear on the ſide of the diſc oppoſite to the ſun, and conſequently on the ſame ſide to which the conical ſhadow is projected. They are eclipſed neareſt the diſc, when the planet is neareſt to its oppoſition.

Finally, the duration of theſe eclipſes anſwers to the time which ſhould elapſe while they traverſe the ſhadow of Jupiter.

Thus it appears that theſe ſatellites move from weſt to eaſt, in returning orbits round the planet. Obſervations of their eclipſes are the moſt exact means of determining their motions. Their mean ſidereal and ſynodical revolutions, as ſeen from the centre of Jupiter, are very accurately determined by comparing eclipſes at long intervals from each other, and obſerved near the oppoſition of the planet. It is thus diſcovered that the motion of the ſatellites of Jupiter is nearly circular and uniform, becauſe this hypotheſis correſponds very nearly with thoſe eclipſes which happen when we ſee this planet in the ſame poſition relatively to the ſun. Therefore, the poſitions of the ſatellites at every inſtant, as ſeen from the centre of Jupiter, may be determined. From hence reſults a ſimple and ſufficiently exact method of comparing with each other the diſtances of Jupiter and of the ſun from the earth:—a method which the ancient aſtronomers did not poſſeſs. For the parallax of Jupiter is inſenſible even to the preciſion of modern obſervations, when it is neareſt to us. They only judged of its diſtance by the time of its revolution; as they eſtimated thoſe planets to be the fartheſt from us, whoſe period of revolution was the longeſt.

Let us ſuppoſe that the total duration of an eclipſe of the third ſatellite has been obſerved. At the middle of the eclipſe, the ſatellite, ſeen from the centre of Jupiter, is nearly in oppoſition to the ſun. Its ſidereal poſition, obſerved from this centre, (which may eaſily be deduced from its mean motion,) is, therefore, the ſame as that of the centre of Jupiter ſeen from the centre of the ſun.

Direct obſervation, or the known motion of the ſun, gives the poſition of the earth as ſeen from its centre. Thus, ſuppoſing a triangle to be formed by the right lines which join the centres of the ſun, the earth, and Jupiter, we have given in this triangle the angle at the ſun, obſervation will give that at the earth, and we ſhall obtain the rectilinear diſtance from Jupiter to the earth and to the ſun, at the inſtant of the middle of the eclipſe, in parts of the diſtance from the ſun to the earth.

It is found by theſe means that Jupiter is at leaſt five times farther from us than the ſun, when its apparent diameter is 38′.3. The diameter of the earth, at the ſame diſtance, would not ſubtend an angle of 3″.5; the volume of Jupiter is, therefore, at leaſt a thouſand times greater than that of the earth.

The apparent diameters of theſe ſatellites being inſenſible, their magnitude cannot be exactly meaſured. An attempt has been made to appreciate it, by the time they take to penetrate the ſhadow of the planet. But there is a great diſcordance in the obſervations that have been made to aſcertain this circumſtance. This ariſes from the various powers of teleſcopes, the different degrees of perfection in the ſight of the obſerver, the ſtate of the atmoſphere, the altitude of the ſatellites above the horizon, their apparent diſtance from Jupiter, and the change of the hemiſphere preſented to us. The comparative brightneſs is independent of the four firſt cauſes, which only alter their proportional light, and ought, therefore, to afford information concerning the rotatory motion of theſe bodies. Dr. Herſchel, who is occupied in this delicate inveſtigation, has obſerved that they ſurpaſs each other alternately in brilliance:—a circumſtance which enables us to judge of the *maximum* and *minimum* of their light. The relation of this *maximum* and *minimum* to their mutual poſitions has perſuaded him, that they turn upon their own axis, like the moon in a period equal to the duration of their revolution round Jupiter: a reſult which Maraldi had already deduced with regard to the fourth ſatellite, from the returns of the ſame ſpot obſerved on its diſc in its paſſage over the planet.

The great diſtance of the celeſtial bodies weakens the phenomena which their ſurfaces preſent, till they are reduced to ſlight variations of light, which eſcape the firſt view, and are only rendered ſenſible by a long courſe of obſervations. But information derived from this ſource ought to be received with the greateſt caution; conſidering how much we may be miſled, on ſuch occaſions, by the effect of imagination.

Explanation of the Tables of Jupiter.

The firſt Table contains the epochs of the mean longitude of the aphelion and node of Jupiter; together with the Arguments of the equations expreſſed by dividing the circle into 10,000 equal parts for Arguments II, III, IV, V; and into 1000 equal parts for Arguments VI, VII, VIII, IX. Table II. contains the mean motions of the ſame for years. Table III. contains the mean motions for months; that is, for the beginning of each month reckoned from the beginning of the year. Table IV. contains the mean motions for days. Table V. contains the mean motions for hours and minutes. Table VI. contains the great equation of Jupiter for every 10 years. Table VII. contains the equation of Jupiter's orbit for the year 1750, with the ſecular variation. Table VIII. contains the equation of the orbit correſponding to Argument II. Table IX. contains the equation anſwering to Argument III. Table X. contains the equation anſwering to Argument IV. Table XI. contains the equation anſwering to Argument V. Table XII. contains the equation anſwering to Argument VI. Table XIII. contains the equation anſwering to Argument VII. Table XIV. contains the equation anſwering to Argument VIII. Table XV. contains the equation anſwering to Argument IX. Table XVI. contains the equation anſwering to Argument VII. — Argument VIII. Table XVII. contains the equation anſwering to Argument VII. + Argument VIII. Table XVIII. contains the radius vector of the orbit of Jupiter for 1750, with the ſecular variation; the mean diſtance of the earth from the ſun being unity. Table XIX. contains the equation of the radius vector anſwering to Argument II. Table XX. contains the equation anſwering to Argument IV. Table XXI. contains the equation anſwering to Argument V. Table XXII. contains the heliocentric latitude of Jupiter for the year 1750, with the ſecular variation. Table XXIII. contains the reduction to the ecliptic; with the log. coſine of the heliocentric latitude.

All the above mentioned equations of the motion of Jupiter, the equations of the orbit excepted, ariſe from the attraction of Saturn, and depend upon the relative ſituation of Jupiter and Saturn. The theory of theſe equations was given by M. de la Place in the Memoirs of 1786, from the theory of gravity, and they were computed by M. de Lambre.

Let a expreſs the number of years from 1750, S the mean longitude of Saturn, I the mean longitude of Jupiter: then the great equation of Jupiter is,

$$-(20' \, 49''.5 - a \times 0''.042733) \times \text{ſin.}\,(5S - 2I + 5^{\circ}\, 34'\, 8'' - a \times 58''.88).$$

The great equation of Saturn ariſing from the attraction of Jupiter, is alſo found to be (Mem. 1785),

$$-(48'\, 44'' - a \times 0''.1) \times \text{ſin.}\,(5S - 2I + 5^{\circ}\, 34'\, 8'' - a \times 58''.88).$$

The period of theſe two equations is 918.76 years. By way of diſtinction, theſe are called the *great* equations of Jupiter and Saturn: theſe two equations of Jupiter and Saturn are very nearly in the ratio of 3 to 7. Now it is manifeſt, that when $5S - 2I - a \times 58''.88 = 360^{\circ}$, the equation muſt then begin again, and therefore this will determine the period; now $5S - 2I - a \times 58''.88$ increaſes $1410''.6$ in a common year; therefore $\frac{360 = 1296000}{1410.6} = 918.76$ years, the period in which theſe equations return again the ſame.

Theſe equations ſhew the reaſon, why the preſent mean motions of Jupiter and Saturn differ from the true mean motions, as the latter cannot be determined but by taking in the above period. We have the apparent mean motion of Saturn, in a common year, by adding to its mean annual motion, the quantity by which the great equation varies in that time, and this quantity is very nearly $= -(48'\, 44'' - a \times 0''.1) \times \text{ſin.}\, 23'\, 31'' \times \text{coſ.}\,(5S - 2I + 5^{\circ}\, 34'\, 8'' - a \times 58''.88)$; and the apparent mean motion of Jupiter is this quantity with a contrary ſign, diminiſhed in the ratio of 7 to 3, and added to his mean annual motion.

Now the fluxion of the coſine of any quantity = ſine × flux. arc, therefore when coſ. = a maximum, ſine × flux. arc = 0, or the ſine of the arc = 0, or the arc = 0; therefore when the above quantity = a maximum, $5S - 2I + 5^{\circ}\, 34'\, 8'' - a \times 58''.88 = 0$, which happened in the year 1560. At that time, the apparent annual motion of Saturn was leſs than the true, by 20″.1, and that of Jupiter greater by 8″.6; ſince that time their apparent mean motions have been approaching to their true mean motions, and in 1789 their apparent and true mean motions were equal. Theſe reſults ſhew, why, in comparing the modern with the ancient obſervations, the mean motion of Saturn appears to be retarded, and that of Jupiter accelerated; and that from a compariſon of the modern obſervations, the mean motion of Saturn appears to be accelerated, and that of Jupiter to be retarded.

Now if H be the heliocentric mean longitude of Jupiter; h that of Saturn, corrected by the above equations reſpectively, computed from the equinox of the year 1750; the other equations of the motion of Jupiter from the action of Saturn, are,

$$\begin{array}{l}
- 1'\, 22''.7\ \text{ſin.}\,(H - h) + 3'\, 24''.3\ \text{ſin.}\, 2\,(H - h) + 17''\\
\quad \text{ſin.}\, 3\,(H - h) + 3''.9\ \text{ſin.}\, 4\,(H - h)\\
+ 2'\, 18''.4\ \text{ſin.}\,(H - 2h - 13^{\circ}\, 33'\, 7'' + a \times 13''.7)\\
+ 1\ 27.4\ \text{ſin.}\,(2H - 3h - 61\ 59\ 48 + a \times 21.9)\\
+ 2\ 47.0\ \text{ſin.}\,(3H - 5h + 55\ 19\ 21 + a \times 43.0)\\
- \quad 16.0\ \text{ſin.}\,(3H - 4h - 62\ 51\ 19)\\
+ \quad 12.8\ \text{ſin.}\,(3H - 2h - 8\ 30\ 15)\\
- \quad 13.0\ \text{ſin.}\,(3h - H - 58\ 31\ 0)\\
+ \quad 11.6\ \text{ſin.}\,(h + 45\ 4')\\
+ \quad 10.0\ \text{ſin.}\,(4H - 5h + 45\ 16\ 32)\\
- \quad 5.4\ \text{ſin.}\,(2H - h + 16\ 1\ 27)
\end{array}$$

Now the ſum of the maxima of all theſe equations, is 11′ 56″.3; and in the Tables computed for theſe equations, each equation is increaſed by its maximum, in order to render all the equations additive; this quantity, therefore, muſt always be ſubtracted from the ſum of the equations taken from the Tables.

To find the heliocentric Latitude and Longitude of Jupiter.

From Table I. of the epochs, take out the epochs of the mean longitude of the aphelion and node, with the Arguments II, III, IV, V, VI, VII, VIII, IX, and place them in an horizontal line. But if the given year be not found in that Table, take the neareſt year preceding the given year as an epoch, and take out as before; under which, from Table II, place the mean motion in longitude, of the aphelion and node, with the Arguments, anſwering to the number of years elapſed ſince the epoch to the given year.

Under theſe, write down (Table III.) the mean motions of the ſame, for the given month.

Under theſe, write down (Table IV.) the mean motions of the ſame, for the given day of the month.

Under theſe, write down (Table V.) the mean motions of the ſame, for the given hours and minutes. The arguments for hours and minutes are ſo ſmall that they are here omitted:

omitted ; the mean motions for ſeconds are alſo omitted for the ſame reaſon. In our computations, therefore, we take to the neareſt minute.

Under theſe, write down the great inequality (Table VI.) in the firſt column, with the correſponding arguments.

Add together the numbers in the ſeveral columns, rejecting 12 *S*, or any multiple thereof, if they occur ; and in the arguments, rejecting 10,000 for Arguments II, III, IV, V, and 1000 for Arguments VI, VII, VIII, IX, or any multiples thereof, and you get, for the given time, the mean longitude corrected for the great equation, the aphelion, the node, and the arguments corrected for the great equation.

From the longitude corrected for the great equation, as already found, ſubtract the longitude of the aphelion, and you have Arg. I. Arg. VII. — Arg. VIII. gives Arg. X. ; Arg. VI. + Arg. VIII. gives Arg. XI.

With Argument I. making proportion for the minutes and ſeconds, take out the equation of Jupiter's orbit in Table VII., together with the ſecular variation, with their proper ſigns, except the time be *before* 1750, in which caſe, the ſecular variation is to be taken out with a contrary ſign ; then ſay, 100 : the years from 1750 to the given time : : the ſecular variation above found : the ſecular variation required. With Argument II. take out the equation in Table VIII, making proportion in this, and in the following equations, for the intermediate numbers of the arguments. With Argument III. take out the equation in Table IX. With Argument IV. take out the equation in Table X. With Argument V. take out the equation in Table XI. With Argument VI. take out the equation in Table XII. With Argument VII. take out the equation in Table XIII. With Argument VIII. take out the equation in Table XIV. With Argument. IX. take out the equation in Table XV. With Argument X. take out the equation in Table XVI. With Argument XI. take out the equation in Table XVII. Take the ſum of all theſe equations (regard being had to the ſigns of the firſt equation and the ſecular variation, the ſigns of the others being all poſitive), and from it ſubtract 11′ 56″.3, and you have the value of theſe eleven equations ; and this applied, with its proper ſign, to the longitude already found as corrected by the great equation, gives the longitude of Jupiter in his orbit.

From the longitude thus found, ſubtract the longitude of the node, and you get Argument XII.

With Argument XII. enter Table XXIII. and take out the reduction to the ecliptic with its proper ſign, making proportion for the minutes and ſeconds of the argument ; and this applied to the longitude of Jupiter in his orbit, gives his true heliocentric longitude on the ecliptic, reckoned from the mean equinox.

With the Argument XII. enter Table XXII. ; take out the latitude with its ſecular variation, making proportion for the minutes and ſeconds of the argument ; and apply the ſecular variation, according to its ſign, to the latitude, and you have the true heliocentric latitude of Jupiter.

With the mean anomaly of Jupiter, enter Table XVIII. and take out the radius vector, and correct it by the following Tables, and you have the true diſtance of Jupiter from the ſun ; the earth's diſtance being unity.

Example.—*To find the true heliocentric Latitude and Longitude of Jupiter, on July* 11, 1780, *at* 5ʰ 49′ *mean Time at Greenwich.*

Argument I. and the ſecular variation being negative, they are added to 11′ 56″.3 to get the negative parts; but if the two firſt taken together had been poſitive, they would have been put above Argument II. amongſt the poſitive equations, and then all the poſitive equations might have been added up, and 11′ 56″.3 ſubtracted from the ſum.

This is the true heliocentric longitude on the ecliptic, from the *mean* equinox; and if we want it from the *true* equinox, we muſt apply to it the equation of the equinoxes.

In this operation, the firſt five lines are taken out immediately from the Tables. The great equation is thus found: for the beginning of 1780 it is 20′ 46″, as found immediately in the Table. The great equation for a very diſtant period is thus found: the variation is expreſſed by $-a \times 0''.042733 \times$ ſin. $(5S - 2I + 5^\circ.\,34'\,8'' - a \times 58''.88)$; if we take $a = 459.38$, which is half a period, $a \times 0''.042733 = 19.''6$, which is additive *before* 1750; this then is the greateſt variation of the equation, taking $5S - 2I + 5^\circ\,34'\,8' - a \times 58''.88 = 90^\circ$, ſo that its ſine may $= 1$, a maximum; that is, it is the variation anſwering to the preſent greateſt equation 20′ 49′.5, for this is the greateſt equation when $a = 0$, or for 1750, and therefore will be very nearly ſo for the preſent time. Now ſuppoſe we wanted to know the equation for May 16, in the year 133, or in the year 133.37; then we multiply a half period by ſuch a number, that the product added to 133 may produce ſome year in our Table VI., and then we find the equation for that year; multiply therefore 459.38 by 4, and add it to 133, and it gives 1970, correſponding to which, the equation is 6′ 40″.2; now the variation of the greateſt equation is 19″.6 for half a period, and therefore it is $4 \times 19'.6 =$

78″.4 for 4 half periods; hence, the greateſt equation 20′ 49′.5 : 6′ 40″.2 :: 78″.4 : 26″, which (as the time is *before* 1750) added to 6′ 40″.2, gives 7′ 6″.2, the equation for May 16, 133. This, however, is only an approximation. We calculate for half periods, becauſe then all the arguments return again the ſame. Now from that time to the given time, that is, July 11, 5^h, the interval is 0.53 of a year; and for 10 years, the increaſe of the equation is 1″.7; hence, 10 : 0.53 :: 1″.7 : 0″.09, the variation in 0.53 of a year; which added to 20′ 46′, gives 20′ 46″.09, or 20′ 46″.1, taking it to the neareſt tenth of a ſecond, the great equation. The arguments of the great equation are taken from the year 1780, they not having ſenſibly altered from that time to the given time. The ſums of all the columns give the longitude corrected by the great equation, the aphelion, the node, and the arguments, for the given time. The Arguments I, X, XI, are immediately found according to the rule. The equation to Argument I. is thus found: the Argument is 20° 7′ 58″. Now in Table VII. the equation anſwering to 20° is — 1° 46′ 59″, and the variation for 60′ is 5′ 9′; hence, 60′ : 7′ 58″ :: 5′ 9″ : 41″, which (as the equation is increaſing) added to — 1 46′ 59″, gives — 1° 7′ 40′, the equation required. And to find the ſecular variation, that variation is — 16″.98 for 20°, and it changes 0″.82 for 60′; hence, 60′ : 7′ 58″ :: 0″.82 : 0″.11, which (as the variation increaſes) added to — 16″.98, gives — 17″.09, the ſecular variation correſponding to the given argument. Now this ſecular variation is reckoned from 1750, and from thence to July 11, 1780, there has elapſed 30.53 years; hence, 100 : 30.53 :: — 17″.09 : — 5″.2, the ſecular variation for 30.53 years. With 9080 take the equation from Table VIII. Now the equation is 1′ 30″.6 for the Argument 9000, and it changes 3″.7 for 100; hence, 100 : 80 :: 3″.7 : 3″, which (as the equation is increaſing) added to 1′ 30″.6, gives 1′ 33″.6, the equation required. By proceeding thus to Argument XI. we get all theſe equations. And by taking the difference of the poſitive and negative parts, we obtain 1° 48′ 57″.8, the value of theſe 11 equations, which applied, with the proper ſign, to 7^s 0° 57′ 53″.9, gives 6^s 29° 8′ 56′.1, the longitude of Jupiter in his orbit. Now for the reduction of this to the ecliptic, we have Argument XII. = 3^s 20° 56′ 24″; and the reduction in Table XXIV. is + 17″.5 for 3^s 20°; and it changes 0″.7 for 60′; hence, 60′ : 56′ 24″ :: 0″.7 : 0″.7, taking it to the neareſt tenth of a ſecond; and this (as the reduction increaſes) added to + 17′.5, gives + 18″.2, the reduction, which applied to 6^s 29 8′ 56″.1, gives 6^s 29° 9′ 14′ 3, the true heliocentric longitude of Jupiter in his orbit, from the mean equinox. With Argument XII. enter Table XXIII. and the latitude for 3^s 20° is 1° 46′ 16″ N., and the variation is 29″ for 60′; hence, 60′ : 56′ 24″ :: 29″ : 27″, which (as the equation is diminiſhing) ſubtracted from 1° 46′ 16′ N., gives 1° 13′ 49″ N., the latitude uncorrected for the ſecular variation. Now for 3^s 20° 56′ 24″, the ſecular variation is — 20″.5, as we may take it the ſame as for 3^s 21°; and the time from 1750 being 30.53 years, we have, 100 : 30.53 :: — 20″.5 : — 6″, the ſecular variation for 30.53 years, and thus applied to 1° 13′ 49″ N., gives 1° 13′ 43″ N., the true heliocentric latitude of Jupiter.

Given the heliocentric latitude and longitude of Jupiter; to find the geocentric latitude and longitude, and his diſtance from the ſun and earth.

Example.—*To find the geocentric latitude and longitude of Jupiter, and his diſtance from the earth, on July* 11, 1780, *at* 5^h 49′ *mean time.*

Jupiter, among *Alchemiſts*, ſignifies the philoſophers' gold. The gentlemen of this profeſſion apply every thing to their art, which the mythologiſts mention of the god Jupiter, pretending that the ancient fables are to be underſtood in a figurative ſenſe: for inſtance, Jupiter is the maſter of the gods; and gold, ſay they, is the moſt precious of metals. Mercury is the ambaſſador of Jupiter; and this ſhews with how much eaſe Mercury inſinuates into every thing. Jupiter holds the thunderbolt as his ſceptre; which evidently points out the external ſulphur uſed in projection. Jupiter has the heavens for his ordinary habitation; this ſhews him volatile, dry, and hot. The debauches of Jupiter, who ſought for pleaſure in the low, but prolific and fruitful earth, diſcover, ſay they, its fecundity, and that gold might be made, were but the way of preparing it diſcovered. In a word, Jupiter is the ſon of Saturn, which ſhews ſome reſemblance between the qualities of gold and lead.

Jupiter, in *Chemiſtry*, denotes tin.

Jupiter's *Beard, Barba Jovis*, in *Botany*, the name given to a ſpecies of anthyllis.

Jupiter's *Beard, American*, is a ſpecies of Amorpha.

Jupiter's *Diſtaff*, is a ſpecies of Salvia or ſage.

Jupiter *Fulminans* and *Fulgurator*. See Fulminant.

Jupiter, *Flamen of*. See Flamen.

JUPUBA, in *Ornithology*. See Oriolus *Hæmorrhous*.

JUPUJUBA, the Braſilian name of a bird of the woodpecker kind, more commonly known by the name Japu. See Oriolus *Perſicus*.

JUQUER, in *Botany*. This plant is found in Braſil, and is of a poiſonous nature; but if we may credit Piſo, its root is its antidote.

JURA, in *Geography*, one of the eleven departments of the eaſtern region of France, compoſed of the bailliages of Dole and Aval, in 46° 40′ N. lat., between Saône and Switzerland. It is bounded on the N. by the department of the Upper Saône, on the E. by the department of the Doubs, and the canton of Berne in Switzerland, on the S. by the department of the Aiſne, and on the W. by the departments of the Saône and Loire, and Côte d'Or. The capital is Lons le Saulnier. This department contains 5278½ kiliometres, or about 256 ſquare leagues, in four diſtricts, 32 cantons, and 728 communes; and 289,865 inhabitants. The diſtricts or circles are Dôle, including 63,581 inhabitants; Poligny, 69,378; Lons-le-Saulnier, 107,478; and St. Claude, 49,428. Its contributions amount to 2,005,226 francs, and its expences to 225,873 fr. 58 cents. The plains in this department produce grain, wine, fruits, and paſtures; the hills yield little grain, but abound in paſtures and extenſive foreſts. It has mines of copper, lead, iron, ſalt, coal, with quarries of marble, ſtone, &c.

Jura, one of the Hebrides, or weſtern iſlands of Scotland, is ſituated oppoſite to the diſtrict of Knapdale, in Argyleſhire, to which county it is politically annexed. Its extent is upwards of thirty miles in length, and, on an average, ſeven in breadth. Of all the weſtern iſles, Jura is the moſt rugged, being chiefly compoſed of mountains of vaſt rocks, apparently piled on each other in the utmoſt diſorder, without a poſſibility of cultivation. The four principal of theſe mountains are termed the Paps-of-Jura; which form a ridge from ſouth to north, nearly through the middle of the iſland. Theſe are conſpicuous at a great diſtance, and terminate the weſtern proſpect from the continent; from their ſituation and height, they are frequently enveloped in clouds and darkneſs. Of theſe four, the ſouthern is called Beinn-Achaolais, "the mountain of the ſound," from its proximity to the ſound of Iſla; the next, which is the higheſt, Beinn-an-oir, "the mountain of gold;" the third, Beinn-ſheunta, "the conſecrated mountain;" and the northern Corra-bhien, "the ſteep mountain." Pennant reports that he aſcended Beinn-an-oir with great difficulty, and deſcribes it as being compoſed of large ſtones, covered with moſſes near the baſe; but all above were bare and unconnected with each other. "The whole," he ſays, "ſeems a *cairn*, the work of the ſons of Saturn." The grandeur of the proſpect from the ſummit, however, compenſated him for the fatigue of the aſcent. Jura itſelf afforded a ſtupendous ſcene of rock, varied with innumerable ſmall lakes, and calculated to raiſe ſublime emotions in the mind of the ſpectator. From the weſt ſide of the hill ran a narrow ſtrip of rock, called *the ſlide of the old hag*, and terminating in the ſea. To the ſouth appeared Ilay, extended like a map; and beyond it, the north of Ireland; to the weſt, Gigha and Cara, Cantyre and Arran, and the Firth of Clyde, bounded by Ayrſhire; an amazing tract of mountains to the north-eaſt, as far as Ben-lomond; Skarba finiſhed the northern view; and over the weſtern ocean were ſcattered Colonſay and Oranſay, Mull, Iona, and the neighbouring group of iſlands; and ſtill further, the long extents of Tirey and Col juſt apparent. Sir Joſeph Banks and his friends, in their journey to Scotland, aſcended Beinn-ſheunta, and found it to be 2359 feet above the level of the ſea; but Beinn-an-oir exceeds that in height by 61 feet. The weſt ſide of the iſland is not fit for cultivation, being ſo wild and rugged, and ſo interſected by torrents ruſhing from the mountains, that no perſon chooſes to make his abode in it. All the inhabitants, therefore, live on the eaſt ſide; where, along the margin of the ſea, the coaſt is pretty level; but at a ſmall diſtance from the ſhore there is a gradual aſcent. The only corn cultivated here is oats and barley; potatoes and flax are alſo produced: the only manure is the ſea-weed, which is caſt on ſhore. Artificial graſſes are unknown; and lime cannot be procured by the poor huſbandmen. On the eaſt coaſt of the iſland are two good harbours: that to the ſouth called the *Small Iſles*; the other the *Lowlandman's Bay*: there are alſo ſome anchoring places on the weſtern coaſt. The mountains of Jura abound with ſeveral kinds of red deer: and they are are alſo frequented by plenty of grouſe and black game. Mr. Pennant mentions his having "ſome obſcure account" of a worm, a native of this iſland, which, though leſs pernicious, bears ſome reſemblance to the Furia infernalis of Linnæus. There are ſeveral barrows and caſtella in the iſland; and on the coaſt, near the harbour of ſmall iſles, are the remains of a very conſiderable encampment. The ſtones of which the mountains are formed, are of white or red quartzy granite; ſome of which are brecciated, or filled with cryſtalline kernels of an amethyſtine colour. Here is great abundance of iron, and a vein of the black oxyd of mangane ſe. The climate of Jura, though neceſſarily of a very moiſt character, is conſidered to be very healthy, and favourable to longevity. When viſited by Mr. Pennant in 1772, it contained only about 750 inhabitants; but in 1793 the number was 1387. The pariſh is ſuppoſed to be the largeſt in Great Britain; and the duty the moſt troubleſome and dangerous; it compriſes Jura, Colonſay, Oronſay, Skarba, and ſeveral little iſles, divided by narrow and hazardous ſounds; forming an extent of ſixty miles; the whole of which is ſupplied by only one miniſter and an aſſiſtant. Pennant's Voyage to the Hebrides.

Jura *Sound*, on the weſtern coaſt of Argyleſhire in Scotland, is a very wide channel, except at its northern end, which ſeparates Ilay, Jura, Luing, Skarba, and ſome ſmaller iſlands, from the main land of Scotland. The ſound of Jura connects with Iſla ſound, Tarbat weſt loch, Kiliſled loch, Achaſtill loch, Crinan loch, and the Crinan canal, Graigneſs loch, &c. Ghia, Cara, Taxa, Auchmin, Borſill, Mackermores, Craggendive, Rukeel, Shunda, and other ſmall iſlands, are ſituated in this capacious ſound.

Jura, (*Juraſſus*, Lat.; *Juras*, Strabo; *Jou-rag*, i.e. the domain of God or Jupiter, in Celtic) a chain of mountains, defending, like a ſtupendous bulwark, the N.W. ſide of Switzerland. The Jura runs S.S.W. to N.N.E. from the Vouache in Savoy to the canton of Schaffhauſen, nearly parallel with the high chain of the Alps; its width towards N.W. being from about 35 to 45 miles. Its higheſt ridge is neareſt to the Alps. Aſcending from the plains of Switzerland, like the ſides of a ſteep roof, to the height of from two to three thouſand feet, (which elevation it preſerves nearly for the whole of its length,) it deſcribes an undulated line, here and there diverſified by riſing hills, which appear from 600 to 1000 feet higher than the reſt of the chain; and it is ſeen gradually to decreaſe in height towards Burgundy. The moſt elevated parts of the Jura (according to Meſſrs. Tralles and Pictet) are, the Dole, 5082 feet above the level of the ſea; the Mont Tendre, 5170; and the Reculet (the ſummit of the Thoiry) 5196 feet.

The Jura not attaining the height of the line of ſnow, is every ſpring deprived of its ſnowy covering; nor are glaciers ever ſeen on it, and it is only in ſome deep grottos, ſuch as thoſe behind Nyon, and between the Travers and Bevine vallies, that pillars and ſlabs of ice are found throughout the year. The paſture-meadows of the Jura are much drier than thoſe of the High Alps; there are, however, in ſome of its parts (for inſtance in the canton of Baſle) full as beautiful and fertile alpine meadows as there are in the central chains: indeed the ſame alpine plants are found there which in thoſe diſtricts are ſeen at the elevation of as much as 500 feet above the level of the ſea. The brown bear ſtill inhabits the weſtern deſart regions of the Jura, and is remembered to have ſeveral times made a deſcent into the Pays de Vaux.

The whole Jura conſiſts of compact lime-ſtone, the ſtratification of which affects various inclinations. Marle, gypſum, petrifactions, and iron-ores, are frequently met with almoſt in every part of it; the fineſt and ſcarceſt petrifactions are found in the department of the Jura, near Orgelet, in a mountain called Perouſe. Along the whole of the E. ſide of the Jura a ſtratum of iron-ſhot clay may be followed, which contains the iron-ore called bean-ore, and is wrought in different places. Here and there ſtrata of brown-coal and ſources of aſphaltum are ſeen in the vallies of the Jura: they owe their origin to foreſts ſwallowed up by thoſe terrible earthquakes, to which the Jura has been ſubject in paſt ages. As geologically remarkable may likewiſe be mentioned the numberleſs blocks of granite and gneiſs, diſperſed all along the eaſt ſide of the Jura, in ſome parts even to the height of 2400 feet. For a more detailed account, ſee Dr. Ebel's Bau der Erde in dem Alpen gebirge, 1805.

JURATAM—*Aſſiſa cadit in juratam.* See ASSISA.

JURATI. See JURATS.

JURATIS, *Non ponendo in.* See NON *Ponendo.*

JURATORES, DISTRINGAS. See DISTRINGAS.

JURATS, JURATI, magiſtrates in the nature of aldermen, for the government of ſeveral corporations.

Thus we meet with the mayor and jurats of Maidſtone, Rye, Winchelſea, &c.—So alſo Jerſey has a bailiff and twelve jurats, or ſworn aſſiſtants, to govern the iſland.

JURBERG, in *Geography*, a town of Samogitia; 20 miles S.S.W. of Roſienne.

JURBO, a river of South America, which runs into the gulf of Darien, N. lat. 8° 15'. W. long. 76'. 44'.

JURBY POINT, a cape on the N.W. part of the Iſle of Man, five miles W. of Ramſay. N. lat. 54° 23'. W. long. 4° 28'.

JURE, *Quo.* See QUO *Jure.*

IVREA, or JUREA, in *Geography*, a town of France, in the department of the Dora, late a city of Piedmont; originally a Roman colony, eſtabliſhed there during the ſixth conſulſhip of Marius, and the firſt of Valerius Flaccus; called *Eporedia.* It is ſituated partly on a plain, and partly on the declivity of a hill; the number of inhabitants is about 6000; it was the ſee of a biſhop, ſuffragan of the archbiſhop of Turin, and the cathedral is ſaid to have been anciently a temple of Apollo. It has a caſtle joining to the town, and two fortreſſes. Beſides the cathedral, it has three other pariſh churches, and ſeveral religious houſes: 20 miles N. of Turin. N. lat. 45° 24'. E. long. 7° 44'.

JUREV POVOLSKOI, a town of Ruſſia, in the government of Koſtrom, on the Volga; 73 miles E.S.E. of Koſtrom. N. lat. 57° 10'. E. long. 43° 14'.

JUREVSKA, a town of Ruſſia, in the government of Olonetz; 42 miles N.E. of Olgſkoi.

JURGIANY, a town of Lithuania, in the palatinate of Troki; 28 miles S. of Birza.

JURGISTAN, a town of Perſia, in the province of Farſiſtan; 105 miles N. of Schiras.

JURIAGUR, a town of Bengal; 30 miles S.W. of Rogonatpour. N. lat. 23° 45'. E. long. 86° 35'.

JURIDICI DIES. See DIES.

JURIEU, PETER, in *Biography*, a celebrated Proteſtant divine, was born at Mer, a ſmall town four leagues from Blois, in the year 1637. He received part of his education in Holland, but completed his ſtudies in England under his uncle, Peter du Moulin. He was admitted to holy orders in the Engliſh epiſcopal church; but on the death of his father he returned to ſucceed him at Mer, and ſubmitted to be re-ordained by Preſbyters according to the Genevan form. Jurieu, though he differed in many reſpects from the reformed, ſet himſelf up as a rigorous defender of orthodoxy. Either his opinions, or the violence of his temper, obliged him to quit the church at Mer, and another alſo at Vitry, and proved the cauſe of many mortifications which he met with at Sedan, to which he afterwards went. In 1682, through the influence of his friend Bayle, he obtained the profeſſorſhip of divinity at Rotterdam, and in connection with this he was appointed miniſter of the Walloon church in the ſame city. In 1685, Jurieu publiſhed "Prejugez legitimes contre le Papiſme," in two volumes; which was followed, in the year 1686, by a work intitled "The Accompliſhment of the Prophecies, or the approaching Deliverance of the Church:" a work in which it is proved that "Popery is the kingdom of Antichriſt; that this kingdom is not far from its ruin, and that this ruin is very ſoon to begin: that the preſent perſecution cannot continue more than three years and a half." With the expectation which the title of this book expreſſes he publiſhed "Paſtoral Letters," to prepare the minds of the reformed in France for the great revolution. The event ſoon falſified his predictions; and he acknowledged he had miſtaken the time, but firmly believed that God had raiſed up king William to execute his great deſign of humbling the perſecutor in France, and of bringing about a ſpeedy deliverance of the reformed. After this he embroiled himſelf in a controverſy with his friend Bayle, whom he uſed extremely ill, as he did many other perſons who were the objects of his diſlike, and who objected to the extravagance of his opinions. He alſo offended his beſt friends by the iraſcibility of his temper in charging M. Saurin and other eminent perſons with heterodoxy. He died at Rotterdam in 1713. His principal works are "The Hiſtory of Calviniſm and Popery;" "On the Unity of the Church;" "An Abridgment of the Hiſtory of the Council of Trent;" "Hiſtory of the Opinions and Religious Ceremonies of the Jews;" "Sermons," &c. Life of Bayle. Moreri.

JURIEWICZE, in *Geography*, a town of Lithuania, in the palatinate of Minſk; 40 miles E. of Minſk.

JURIEWO, a town of Lithuania, in the palatinate of Minſk; 20 miles E N.E. of Minſk.

JURILGUNGE, a town of Bengal, in Chittigong; 35 miles N.N.W. of Iſlamabad.

JURIN, James, in *Biography*, a phyſician of the mathematical ſect, was, during ſeveral years, an active member and ſecretary of the Royal Society of London, and, at the time of his death, in 1750, was preſident of the College of Phyſicians. He diſtinguiſhed himſelf by a ſeries of ingenious eſſays, to the number of ſeventeen, which were publiſhed in the Philoſophical Tranſactions in the years 1718, 1719, &c.; and afterwards printed collectively, in 1732, under the title of "Phyſico-Mathematical Diſſertations," in which mathematical ſcience was applied with conſiderable acuteneſs to phyſiological ſubjects. Theſe papers involved him in ſeveral philoſophical controverſies; firſt with Keill, in conſequence of his calculations in regard to the force of the contractions of the heart, againſt which alſo Senac publiſhed ſome objections, which he anſwered. Jurin computed the contractile force of the heart to be equal to fifteen pounds four ounces; that of the right ventricle being equal to ſix pounds three ounces, and that of the left to nine pounds one ounce. To Smith's Syſtem of Optics, publiſhed in 1738, Jurin added "An Eſſay upon diſtinct and indiſtinct Viſion," in which he made ſubtle calculations of the changes neceſſary to be made in the figure of the eye to accommodate it to the different diſtances of objects. This paper was commented on by Robins, to whom Jurin wrote a reply. He had likewiſe controverſies with Michelotti reſpecting the force of running water, and with the philoſophers of the ſchool of Leibnitz on living forces. He communicated to the Royal Society ſome experiments made with a view to determine the ſpecific gravity of the human blood, and he contributed much to the improvement of their meteorological obſervations. He was a warm partiſan and an active defender of the practice of inoculation; and in ſeveral publications, giving an account of its ſucceſs from 1723 to 1727, eſtabliſhed its utility upon the true foundation of a compariſon between the reſpective mortality of the caſual and the inoculated ſmall-pox. He did not, however, foreſee, that this practice, although preſerving the lives of thoſe who had recourſe to it, yet contributed to increaſe the mortality in general, in conſequence of keeping up an artificial epidemic, as it were, by a conſtant multiplication of the contagion. His papers in the Philoſophical Tranſactions, are to be found in vols. lx. to lxvi. incluſive. Eloy. Dict. Hiſt. Gen. Biog.

JURINGI, in *Geography*, a town of Japan, in the iſland of Niphon; 40 miles W.N.W. of Jedo.

JURIS Utrum, in *Law*, a writ called the parſon's writ of right (Booth. 221.), which lies for the parſon of a church, or prebendary, at common law, and for a vicar by ſtat. 14 Ed. III. c. 17. whoſe predeceſſor hath alienated the lands and tenements thereof, by which they may recover lands and tenements belonging to the church, or of which they were diſſeiſed; or which were recovered againſt them by verdict, confeſſion, or default, without praying in aid of the patron and ordinary; or on which any perſon has intruded ſince the predeceſſor's death. (F. N. B. 48, 49.) But ſince the reſtraining ſtatute of 13 Eliz. c. 10. whereby the alienation of the predeceſſor, or a recovery ſuffered by him of the lands of the church, is declared to be abſolutely void, this remedy is of little uſe, unleſs where the parſon himſelf has been deforced for more than twenty years (Booth. 221); for the ſucceſſor, at any competent time after his acceſſion to the benefice, may enter, or bring an ejectment.

JURISCONSULTUS, or Jureconsultus, Ictus, among the Romans, was a perſon learned in the law; a maſter of the Roman juriſprudence; who was conſulted on the interpretation of the laws and cuſtoms, and the difficult points in law-ſuits.

The fifteen books of the Digeſt were compiled wholly from the anſwers, or reports, of the ancient juriſconſulti. Trebonianus, in deſtroying the two thouſand volumes from whence the Code and Digeſt were taken, has deprived the public of many things, which would have given them light into the office of the ancient juriſconſulti.

We ſhould ſcarce have known any thing beyond their bare names, had not Pomponius, who lived in the ſecond century, taken care to preſerve ſome circumſtances of their office.

The Roman juriſconſulti ſeem to have been the ſame with our chamber counſellors, who arrived at the honour of being conſulted, through age and experience, but never pleaded at the bar. Their pleading advocates or lawyers never became juriſconſulti.

In the times of the commonwealth, the *advocati* had by much the more honourable employment, as being in the ready way to attain to the higheſt preferments. They then deſpiſed the juriſconſulti, calling them in deriſion *formularii* and *leguleii*, as having invented certain forms and monoſyllables, in order to give their anſwers the greater appearance of gravity and myſtery. But in proceſs of time they became ſo much eſteemed, that they were called *prudentes* and *ſapientes*, and the emperors appointed the judges to follow their advice. Auguſtus at length advanced them to be public officers of the empire; ſo that they were no longer confined to the petty counſels of private perſons.

Bern. Rutilius has written the lives of the moſt famous juriſconſulti, who have lived within theſe two thouſand years.

JURISDICTION, a power, or authority, which a man has to do juſtice in caſes of complaints made before him. There are two kinds of juriſdiction; the one *eccleſiaſtical*, the other *ſecular*.

Secular, belongs to the king, and his juſtices, or delegates.

The courts and judges at Weſtminſter have juriſdiction all over England, and are not reſtrained to any county or place; but all other courts are confined to their particular juriſdictions, which if they exceed, whatever they do is erroneous. There are three ſorts of inferior juriſdictions; the firſt is *tenere placita*, to hold pleas, and the plaintiff may ſue either there or in the king's courts. Another is the conuſance of pleas, where a right is inveſted in the lord of the franchiſe to hold pleas; and he is the only perſon that can take advantage of it, by claiming his franchiſe. The third ſort is an exempt juriſdiction, as where the king grants to ſome city, that the inhabitants ſhould be ſued within their city, and not elſewhere; though there is no juriſdiction that can withſtand a *certiorari* to the ſuperior courts. Among the various beneficial regulations of Edward I. he defined the limits of the ſeveral temporal courts of the higheſt juriſdiction, thoſe of the king's bench, common pleas, and exchequer, ſo as they might not interfere with each other's proper buſineſs: to do which they muſt now have recourſe to a fiction, very neceſſary and uſeful to the preſent enlarged ſtate of property. He alſo ſettled the boundaries of the inferior courts in counties, hundreds, and manors; confining them to cauſes of no great amount, according to their primitive inſtitution. See Justice, and Court.

Eccleſiaſtical juriſdiction belongs to biſhops and their deputies. See Bishop, and Official.

Biſhops, &c. have two kinds of juriſdiction; the one in-

ternal, which is exerciſed over the conſcience in things purely ſpiritual; and this they are ſuppoſed to hold immediately of God.

The other is *contentious*, which is a privilege ſome princes have given them in terminating diſputes between eccleſiaſtics and laymen. (See Contentious.) Edward I. gave a mortal wound to the encroachments of the pope and his clergy, by limiting and eſtabliſhing the bounds of eccleſiaſtical juriſdiction; and by obliging the ordinary, to whom all the goods of inteſtates at that time belonged, to diſcharge the debts of the deceaſed.

Jurisdiction, *Encroachment of*, an injury, cognizable by the courts of the common law, which conſiſts in calling one "coram non judice," to anſwer in a court that has no legal cognizance of the cauſe. For this injury the common law has provided a remedy by the writ of prohibition. See Prohibition.

Jurisdiction, *Plea to the*, is where an indictment is taken before a court that hath no cognizance of the offence: as if a man be indicted for a rape at the ſheriff's tourn, or for treaſon at the quarter ſeſſions: in theſe, or ſimilar caſes, he may except to the juriſdiction of the court, without anſwering at all to the crime alleged. 2 Hal. P. C. 236. See Dilatory Pleas.

JURISPRUDENCE, the ſcience of what is juſt and unjuſt, or of the laws, rights, cuſtoms, ſtatutes, &c. neceſſary for the doing of juſtice.

Civil juriſprudence is that of the Roman law; *canonical* that of the canon law; and *feudal*, that of fees.

JURJURA, in *Geography*, a mountain of Africa, the higheſt in Barbary, anciently called the "Mons ferratus." It is, ſays Shaw (in his Travels) at leaſt eight leagues long; and if we except a pool of good water, bordered round with arable ground, that lies near the middle of it, the whole, from one end to another, is a continued range of naked rocks and precipices. In the winter ſeaſon the ridge of this mountain is covered with ſnow: and it is remarkable, that whilſt the inhabitants of one ſide of it maintain an hereditary implacable animoſity againſt thoſe of the other, yet, by conſent, this border of ſnow puts a full ſtop to all hoſtilities during that ſeaſon: which, like thoſe of the cranes and pigmies, as related by the poet, are renewed with freſh vigour in the ſpring:

> Ηέριαι δ' αρα ταιγε κακὴν ἔριδα προφέρονται.
>
> Il. γ. v. 7.

This mountain lies between Dellys (Ruſcurium) and Boujeiah (Saldis).

JURKONE, a town of Hindooſtan, in the circar of Kitchwara; 15 miles S. of Budawar.

JURMO, a ſmall iſland in the Baltic, between the iſland of Aland and the coaſt of Finland. N. lat. 60° 33'. E. long. 20° 52'.

JURO, or Devil's *Iſland*, a ſmall iſland in the Grecian Archipelago. N. lat. 39° 33'. E. long. 24° 15.'

JUROCO, a town of Brazil, in the province of Minas Geraes; 110 miles S.W. of Villa Rica.

JUROR, Jurator, in a *Legal Senſe*, is one of thoſe twenty-four, or twelve men, who are ſworn to deliver truth upon ſuch evidence as ſhall be given them touching any matter in queſtion.

The puniſhment of petty jurors attainted of giving a verdict contrary to evidence, willingly, is very ſevere. See Attaint.

The practice, heretofore in uſe, of fining, impriſoning, or otherwiſe puniſhing jurors, merely at the diſcretion of the court, for finding their verdict contrary to the direction of the judge, was arbitrary, unconſtitutional, and illegal, and was treated as ſuch by ſir Thomas Smith, more than 200 years ago; who accounted "ſuch doings to be very violent, tyrannical, and contrary to the liberty and cuſtom of the realm of England." For, as ſir Matthew Hale well obſerves (2 Hal. P. C. 313.), it would be a moſt unhappy caſe for the judge himſelf, if the priſoner's fate depended upon his directions: unhappy alſo for the priſoner; for if the judge's opinion muſt rule the verdict, the trial by jury would be uſeleſs. Yet in many inſtances, where, contrary to evidence, the jury have found the priſoner guilty, their verdict hath mercifully been ſet aſide, and a new trial granted by the court of king's bench; for in ſuch caſe, as it hath been ſaid, it cannot be ſet right by attaint. But there hath yet been no inſtance of granting a new trial where the priſoner was *acquitted* upon the firſt. 2 Hawk. P. C. 442. Blackſt. Com. b. iv.

Jurors, *Challenge to the*. See Challenge.

JUROUDA, in *Geography*, a town of Hindooſtan, in the circar of Chandaree; 15 miles S.E. of Seronge.

JUROZEE, a town of Ruſſian Lithuania; 80 miles S.E. of Minſk.

JUR-TCHEREMONSKOI, a town of Ruſſia, in the government of Toboſk, on the Oby; 68 miles S. W. of Tomſk.

JURVA, a town of Sweden, in the government of Waſa; 32 miles N.N.E. of Chriſtianſtadt.

JURUCUA, in *Zoology*, the Braſilian name of a ſpecies of tortoiſe. This has feet almoſt in ſhape of wings, the fore ones about ſix inches long, the hinder ones conſiderably ſhorter; its tail is ſhort, and of a conic figure; its eyes large and black; its mouth has no teeth, but reſembles the beak of a bird. It frequently grows to four feet long, and about three in width; its ribs are faſtened to the ſhell, and are eight on each ſide; the middle ones of theſe are the longeſt, the fore and hinder ones being the ſhorter. The fleſh and eggs of this ſpecies are very delicately taſted; they lay their eggs in holes on the ſea-ſhore, covering them over with ſand, and leaving them for the ſun to hatch them. There are uſually a great many very odd figures, like geometrical lines, running in various directions on the ſhell; the whole ground of the ſhell is uſually black and very gloſſy, adorned with yellow variegations; but this is no certain character of the ſpecies, the varieties in the colouring of theſe ſhells being very great. See Testudo *Mydas*.

JURUNCAPEBA, in *Ichthyology*, the name of a ſea-fiſh, of the turdus or wraſſe kind, caught about the ſhores of the Braſils, and called alſo *itaiara*. It is uſually about five or ſix inches long, about a third part of its length in breadth; its mouth is extremely large and wide, and of a ſomewhat triangular figure.

It is caught among the rocks, and is a very delicate fiſh for the table.

JURUNGE, in *Geography*, a town of Hindooſtan, in Bahar, on the Bogmutty; 13 miles W. of Durburgah.

JURURA, in *Zoology*, the name of a ſpecies of tortoiſe, common in the Braſils. It is a ſmall kind, ſeldom exceeding ten fingers in breadth, and eight or nine in length, and of an elliptic figure; its under ſhell is about nine fingers long, and four and a half broad, and is flat; it can at pleaſure hide its whole body in the ſhell, or thruſt out its neck to three fingers' breadth diſtance; the head is thick and long, the noſe elevated and pointed; the mouth is large, and the eyes black; it has four long claws on its feet; its tail is ſhort and pointed; and its ſkin is rough and ſcaly. The upper ſhell is brown, the lower yellow; its eggs are white and round, and about half the ſize of a hen's egg, and are very well taſted.

JURY, in *Common Law*, ſignifies twenty-four, or twelve men, ſworn to inquire of a matter of fact, and declare the truth, upon ſuch evidence as ſhall be delivered them touching the matter in queſtion.

The mode of trial by jury, called alſo the trial "per pais," or "by the country," is very ancient, and ſeems to have been coeval with the civil government of this nation. Some authors have endeavoured to trace the original of juries up as high as the Britons themſelves, the firſt inhabitants of our iſland; it is certain, however, that they were in uſe among the earlieſt Saxon colonies, their inſtitution being aſcribed by biſhop Nicholſon to Woden himſelf, their great legiſlator and captain. Sir John Spelman has repreſented Alfred as the author of trials by juries; but his proof has not been thought to be deciſive. Dr. Pettingal, who has found the uſe and practice of juries amongſt the ancient Greeks and Romans, and who thinks that the riſe of the Engliſh jury may be deduced from them, has ſupported his opinion with much ingenuity and learning.

Traces of this mode of trial in Germany have been thought to be viſible in the 100 co-aſſeſſors, mentioned by Tacitus, as choſen out of the Ingenui, which the lord of a territory had when he ſat in judgment. This number, ſays Mr. Carte, prevailed undoubtedly among the Saxons, as it did likewiſe in all the northern nations, till ſucceeding times gave occaſion to ſome alterations. Thus, among the Danes, the number of theſe aſſeſſors was reſtrained to twelve in the time of Redner Ladebrog; and the ſame number is ſtill kept up in Sweden. When it was firſt thus reduced in England does not appear from any paſſage in our old hiſtorians. Nevertheleſs, Mr. Carte infers, that this was the eſtabliſhed number in Alfred's time, from his hanging Cadwine for ſentencing a man to that kind of death, without the aſſent of all the twelve jurors, upon whom he had put himſelf to be tried; and from the laws which he gave to Gothurn. According to the ſame hiſtorian, it is very probable that Alfred was the author of extending to *civil* cauſes the trial by jury, which had been, perhaps, uſed before only in *criminal* caſes. Sir William Blackſtone contends, that this is a mode of trial which has prevailed time out of mind in this nation. Accordingly he ſays, traces of juries may be found in the laws of all thoſe nations which adopted the feudal ſyſtem, as in Germany, France, and Italy, and in England we find actual mention of them ſo early as the laws of king Ethelred, and even then not as a new invention. The truth, ſir William ſays, ſeems to be, that this tribunal was univerſally eſtabliſhed among all the northern nations; and ſo interwoven in their very conſtitution, that the earlieſt accounts of one, give us alſo ſome traces of the other. On the other hand, there are not wanting conſiderable names, who refer the introduction of juries into England to a much later period. Dr. Hickes, who finds the original of this inſtitution in Scandinavia, aſſerts, that it was not known to the Saxons, and that it did not take place in our own country till after the Norman conqueſt. Mr. Barrington and Dr. Henry, in deference, as it ſhould principally ſeem, to Dr. Hickes's profound knowledge in Saxon learning, have given their ſanction to theſe ſentiments: but it clearly appears that they have done ſo without ſufficient reaſon. The eſtabliſhment and uſe of this mode of trial in our iſland, though for a time greatly impaired and ſhaken by the introduction of the Norman trial by battle, were ſo highly eſteemed and valued by the people, that no conqueſt, no change of government, could ever prevail to aboliſh it. In "Magna Carta" it is more than once inſiſted on, as the principal bulwark of our liberties. (See Judicium *parium*) And it has been ever eſteemed, in all countries capable of appretiating its importance and utility, a privilege of the higheſt and moſt beneficial nature.

Trials by jury in civil cauſes are of two kinds; extraordinary and ordinary. The firſt ſpecies of extraordinary trial by jury is that of the grand aſſize. See Assizes.

Another ſpecies of extraordinary juries, is the jury to try an *Attaint*; which ſee.

With regard to the ordinary trial by jury in civil caſes, when an iſſue is joined, the court awards a writ of *venire facias*, which is accordingly iſſued to the ſheriff. Thus the cauſe ſtands for a trial *at the bar* of the court itſelf, provided it be of conſequence; but all trifling ſuits are ended in the court baron, hundred, or county courts. However, when the uſage began to bring actions of any trifling value in the courts of Weſtminſter-hall, it was found very inconvenient to compel the parties, witneſſes, and jurors, to come from the remoteſt parts of the country to try a trivial action at Weſtminſter; and, therefore, the legiſlature referred matters in iſſue to the juſtices of aſſiſe. Accordingly it was enacted by 13 Edw. I. cap. 30. that a clauſe of *niſi prius* ſhould be inſerted in all the writs of *venire facias*, by virtue of which the ſheriff returned his jurors to the court of the juſtices of aſſiſe, which was ſure to be held in the vacation before Eaſter and Michaelmas terms, and there the trial was had. But this method was inconvenient, and therefore was altered by 42 Edw. III. cap. 11. which ſtatute enacted, that no inqueſts, except of aſſiſe and gaol delivery, ſhould be taken by writ of *niſi prius*, till after the ſheriff had returned the names of the jurors to the court above. It is now the courſe to make the ſheriff's *venire* returnable on the laſt return of the ſame term wherein iſſue is joined, *viz.* Hilary or Trinity terms, which are called iſſuable terms; and he returns the names of the jurors in a panel, *i.e.* little pane, or oblong piece of parchment, annexed to the writ. This jury is not ſummoned, and therefore not appearing at the day, muſt unavoidably make default: for which reaſon a compulſive proceſs is now awarded againſt the jurors, called in the common pleas a writ of *habeas corpora juratorum*, and in the king's bench a *diſtringas*. The entry, therefore, on the roll or record is, "that the jury is reſpited, through defect of the jurors, till the firſt day of the next term, then to appear at Weſtminſter; unleſs before that time, *viz.* on Wedneſday the fourth of March, the juſtices of our lord the king appointed to take aſſizes in that county ſhall have come to the place aſſigned for holding the aſſizes, &c." And as the judges are ſure to come and open the circuit commiſſions on the day mentioned in the writ, the ſheriff returns and ſummons this jury to appear at the aſſizes, and there the trial is had before the juſtices of aſſize and *niſi prius*; among whom are uſually two of the judges of the courts at Weſtminſter, the whole kingdom being divided into ſix circuits for this purpoſe. If the ſheriff be not an indifferent perſon, or if he be a party in the ſuit, or be related either by blood or affinity to either of the parties, the *venire* ſhall be directed, not to him, but to the coroners; and if any exception lies againſt them, to two clerks of the court, or to two perſons of the county named by the court and ſworn, and called *eliſors*, or electors, who ſhall indifferently name the jury, and their return is final. In order farther to remove all ſuſpicion of partiality, it is provided by the ſtatutes 4 Edw. III. cap. 2. 8 Ric. II. cap. 2. and 33 Hen. VIII. cap. 24. that no judge of aſſize ſhould hold pleas in any county where he was born or inhabits. See 12 Geo. II. c. 27. and Justices *of Oyer*, &c.

When the general day of trials is fixed, the plaintiff, or his attorney, muſt bring down the record to the aſſizes, and enter it with the proper officer, in order to its being called in courſe. If it be not ſo entered, it cannot be tried; therefore it is in the plaintiff's breaſt to delay any trial by not carrying down the record, unleſs the defendant undertakes to bring on the trial by giving proper notice to the plaintiff. This proceeding is called the trial by proviſo. However, this practice hath begun to be diſuſed, ſince the ſtatute 14 Geo. II. cap. 17, which enacts, that if, after iſſue joined, the cauſe is not carried down to be tried according to the courſe of the court, the plaintiff ſhall be eſteemed to be non-ſuited, and judgment ſhall be given as in caſe of a non-ſuit. In caſe the plaintiff intends to try the cauſe, he is bound to give the defendant (if he lives within forty miles of London) eight days notice of trial; and if he lives at a greater diſtance, fourteen days notice; and if he changes his mind, and does not countermand the notice ſix days before the trial, he ſhall be liable to pay coſts to the defendant for not proceeding to trial, by the laſt-mentioned ſtatute. The defendant, however, or plaintiff, may, upon good cauſe ſhewn to the court above, as upon abſence or ſickneſs of a material witneſs, obtain leave upon motion to defer the trial of the cauſe till the next aſſizes. But when the cauſe is called on regularly in court, the record is conveyed to the judge, while the jury is called and ſworn. To this end the ſheriff returns his compulſive proceſs, the writ of *habeas corpora*, or *diſtringas*, with the panel of jurors annexed, to the judge's officer in court. The jurors contained in the panel are either ſpecial or common jurors. See *Special* JURY.

A *common* jury is one returned by the ſheriff, according to the directions of the ſtatute 3 Geo. II. cap. 25, which appoints that the ſheriff or officer ſhall not return a ſeparate panel for every ſeparate cauſe, as formerly; but one and the ſame panel for every cauſe to be tried at the ſame aſſizes, containing not leſs than forty-eight, nor more than ſeventy-two jurors: and that their names, being written on tickets, ſhall be put into a box or glaſs: and when each cauſe is called, twelve of theſe perſons, whoſe names ſhall be firſt drawn out of the box, ſhall be ſworn upon the jury, unleſs abſent, challenged, or excuſed; or unleſs a previous view of the lands or tenements, or other matters in queſtion, ſhall have been thought neceſſary by the court (ſtat. 4 Ann. c. 16.); in which caſe ſix or more of the jurors returned, to be agreed on by the parties, or named by a judge, or other proper officer of the court, ſhall be appointed to take ſuch a view, and then ſuch of the jury as have appeared upon the view, ſhall be ſworn on the inqueſt, previous to any other jurors.

Liſts of the jurors qualified according to the acts 4 & 5 W. & M. cap. 24. 7 & 8 W. III. cap. 32. and 3 & 4 Ann. cap. 18. are now to be made from the rates of each pariſh. The juſtices at Midſummer ſeſſions are to iſſue warrants to the high conſtables who require the petty conſtables to prepare ſuch liſts; and if the high conſtables neglect to iſſue their precepts for this purpoſe, they ſhall forfeit 10*l.* Theſe liſts are to be fixed on the doors of churches, &c. twenty days before Michaelmas, that public notice may be given of perſons omitted who are qualified, and of perſons inſerted, who ought to be omitted. (3 Geo. II. cap. 25.) And if any perſons are inſerted wrongfully, or omitted for the ſake of reward, &c. the petty conſtable incurs a forfeiture of 20*s.* The liſts ſhall be delivered by the petty conſtables, at Michaelmas ſeſſions, in open court; or when they are ſubſcribed by them, and atteſted on oath, and alſo ſigned by the juſtice, they ſhall be delivered by the petty conſtables to the high conſtables, who ſhall deliver them, upon oath, in open court. The conſtable failing to make ſuch return ſhall forfeit 5*l.* Perſons not qualified may be diſcharged by the juſtices at the ſeſſions. Theſe liſts ſhall be then fairly entered in a book by the clerk of the peace, on forfeiture of 20*l.* and duplicates of them ſhall, during the ſeſſions, or within ten days after, be delivered by him to the ſheriff, who ſhall cauſe the names, with their additions, &c. to be entered in a book of his own; and if the ſheriff ſhall return any perſon whoſe name is not in the duplicates, he is liable to a fine not exceeding 10*l.* nor leſs than 40*s.* (3 Geo. II. cap. 25.) Every ſummons of jurors ſhall be made by the ſheriff, his officer, or lawful deputy, ſix days before the ſeſſions at leaſt, in Wales eight days before; and in the counties palatine fourteen days before; and the penalty of neglect, or of excuſing any perſon for favour or reward, is 20*l.* by 7 & 8 W. cap. 32, or a fine of 10*l.* or under, impoſed by the judge of aſſize. (3 Geo. II. cap. 25.) No perſon ſhall be ſummoned, who has ſerved within one year before in the county of Rutland, or two years before in any other county, not being a county of a city or town, and except the counties of York and Middleſex, under a fine not exceeding 5*l.* Every perſon who has ſerved, ſhall have a certificate gratis, teſtifying his attendance. (3 Geo. II. cap. 25.) In the county of York, jurors ſhall not be returned above once in four years; and the ſheriff neglecting his duty ſhall forfeit 100*l.* and for not diſcharging a juror, who has ſerved within four years, and giving notice to the party ſummoned, ſix days before the aſſizes or ſeſſions, ſhall forfeit 20*l.* to the party with full coſts. (7 & 8 W. cap. 31. 3 & 4 Ann. cap. 18. and 10 Ann. cap. 14.) In the county of Middleſex, no perſon ſhall be returnable to ſerve as a juror, at any ſeſſions of *niſi prius*, who hath been returned in the two terms or vacations next before, on pain of the ſheriff being fined by the judge 5*l.* or under. (4 Geo. II. cap. 7.) And by 7 & 8 W. cap. 32. the inhabitants of the city and liberty of Weſtminſter ſhall be exempted from ſerving on any jury at the ſeſſions for Middleſex, by reaſon of their attendance at the courts of Weſtminſter. By the common law, jurors returned, and not appearing, ſhall loſe and forfeit the iſſues returned upon them. And if a juryman be called, and, being preſent, refuſe to appear; or, having appeared, withdraw before he be ſworn, the court may fine him at their diſcretion. (35 Hen. VIII. cap. 6.) And by 29 Geo. II. cap. 19. a juror not appearing and ſerving in any court of record within the city of London, or in any other city or town corporate, liberty or franchiſe, after being openly called three times, &c. ſhall, without reaſonable excuſe, be fined not more than 40*s.* nor leſs than 20*s.* And by 3 Geo. II. cap. 25. in cauſes of *niſi prius*, every perſon whoſe name ſhall be drawn, and who ſhall not appear without reaſonable excuſe, ſhall forfeit not exceeding 5*l.* nor leſs than 40*s.* If a juror take a bribe of either party, he ſhall forfeit ten times as much as he hath taken. (5 Edw. III. cap. 10. 34 Edw. III. cap. 8. 38 Edw. III. ſtat. 1. cap. 12.) If a man aſſault or threaten a juror for giving a verdict againſt him, he is puniſhable by fine or impriſonment; and if he ſtrike him in the court, in the preſence of a judge of aſſize, he ſhall loſe his hand and his goods, and profits of his lands during life, and ſuffer perpetual impriſonment.

The jury is to be choſen of the ſame claſs or rank with the parties, and by the policy of the ancient law, the jury was to come *de vicineto*, from the neighbourhood of the vill or place where the cauſe of action was laid in the declaration, and for want of this, the array might be challenged for defect of hundredors. However, this practice was entirely aboliſhed by 4 & 5 Ann. cap. 16. upon all civil actions, except upon penal ſtatutes: and upon thoſe alſo by the 24 Geo. II. cap. 18. the jury being now only to come, *de corpore comitatus*, from the body of the county at large, and not *de vicineto*, or from the particular neighbourhood. It is alſo enacted by 28 Edw. III. cap. 13. enforced by 8 Hen. VI. cap. 29. that where either party is an alien born, the jury ſhall be one half aliens, and the other denizens, if required, for the more impartial trial. But where both parties are aliens, the whole jury are directed to be denizens, by 21 Hen. VI. cap. 4. For other grounds of challenge and qualification of jurors, ſee CHALLENGE. Jurors in London and Weſtminſter muſt not only be houſekeepers, but have lands or goods worth one hundred pounds; and they may be examined on oath as to that point. (3 Geo. II. cap. 25.) All cities, boroughs, and corporate towns, are excepted out of the act that ſettles the qualifications of jurors for county aſſizes or ſeſſions; and triers of felons in corporations may be men worth 40*l.* in goods, though they have no freehold. Jurors in the torn ſhall have 20*s.* a-year freehold, or 26*s.* 8*d.* copyhold. Any perſon whatſoever is capable of being put upon the jury in a court-leet, and upon the coroner's jury. The qualifications of jurors, with regard to eſtate, depend upon a variety of ſtatutes. But by the laſt ſtatute 3 Geo. II. c. 25. any leaſe-holder for the term of 500 years abſolute, or for any term determinable upon life or lives, of the clear yearly value of 20*l per annum*, over and above the rent reſerved, is qualified to ſerve upon juries. By the common law every grand-juryman ought to be a freeman (1 Hawk. 255); and a freeholder (2 H. H. 155.) But in Yorkſhire, they ought to have 80*l.* a-year, freehold or copyhold. (7 & 8 W. c. 32.) Perſons excuſed from ſerving on juries are thoſe that are ſick and decrepit; thoſe not commorant in the county, and men above ſeventy years old, by 13 Edw. I. c. 38. and by 7 & 8 Will. III. c. 32 infants under twenty-one. This exemption is alſo extended, by divers ſtatutes, cuſtoms, and charters, to phyſicians, and other medical perſons, counſel, attornies, officers of the courts, and the like; all of whom, if impannelled, muſt ſhew their ſpecial exemptions. Diſſenting teachers, qualified under the toleration act, are exempted, and alſo quakers. Clergymen are alſo uſually excuſed; but if they are ſeiſed of land and tenements, they are ſtrictly liable to be impannelled in reſpect of their lay fees, unleſs they be in the ſervice of the king, or of ſome biſhop.

If, by means of challenges or other cauſe, a ſufficient number of unexceptionable jurors doth not appear at the trial, either party may pray a tales. When the legal number of twelve is obtained, they are then ſeparately ſworn, well and truly to try the iſſue between the parties, and a true verdict to give, according to the evidence; and hence they are denominated the *jury*, *jurata*, and jurors, *ſc. juratores.* Pleadings are then opened to them by counſel on that ſide which holds the affirmative of the queſtion in iſſue; the nature of the caſe, and the evidence intended to be produced are next laid before them by counſel alſo on the ſame ſide; and when their evidence is gone through, the advocate on the other ſide opens the adverſe caſe, and ſupports it by evidence; and then the party which began is heard by way of reply. See EVIDENCE.

As to ſuch evidence as the jury may have in their own conſciences, by their private knowledge of facts, it was an ancient doctrine, that this had as much right to ſway their judgment as the written or parol evidence which is delivered in court; and, therefore, it hath been often held, that though no proofs be produced on either ſide, yet the jury might bring in a verdict. But this doctrine was gradually exploded, when attaints began to be diſuſed, and new trials introduced in their ſtead. And if a juror knows any thing of the matter in iſſue, he may be ſworn as a witneſs, and give his evidence publicly in court. When the evidence on both ſides is gone through, the judge, in the preſence of the parties, the counſel, and all others, ſums up the whole to the jury; who, unleſs the caſe be very clear, withdraw from the bar to conſider of their verdict; and, in order to avoid intemperance and cauſeleſs delay, they are to be kept without meat, drink, fire, or candle, unleſs by permiſſion of the judge, till they are all unanimouſly agreed. And if they eat or drink, or have any eatables about them, without conſent of the court, and before verdict, it is finable; and if they do ſo at his charge for whom they afterwards find, it will ſet aſide the verdict. Alſo, if they ſpeak with either of the parties or their agents, after they are gone from the bar, or if they receive any freſh evidence in private, or if, to prevent diſputes, they caſt lots for whom they ſhall find, any of theſe circumſtances will entirely vitiate the verdict. And it has been held, that if the jurors do not agree in their verdict before the judges are about to leave the town, though they are not to be threatened or impriſoned, the judges are not bound to wait for them, but may carry them round the circuit from town to town in a cart. When they are all unanimouſly agreed, the jury return back to the bar; and before they deliver their verdict, the plaintiff is bound to appear in court, by himſelf, attorney, or counſel, in order to anſwer the amercement, to which by the old law he is liable, in caſe he fails in his ſuit, as a puniſhment for his falſe claim; a form which is ſtill continued, though the amercement is diſuſed; and if the plaintiff does not appear, no verdict can be given, but the plaintiff is ſaid to be *non-ſuit*. But in caſe the plaintiff appears, the jury by their foreman deliver in their verdict. When the jury have delivered in their verdict, and it is recorded in court, they are then diſcharged. Such is the proceſs of trial by jury in civil caſes; a trial which, beſides the other vaſt advantages which attend it, is as expeditious and cheap, as it is convenient, equitable, and certain. On theſe accounts, ſays judge Blackſtone, "the trial by jury ever has been, and I truſt ever will be, looked upon as the glory of the Engliſh law." It is "the moſt tranſcendent privilege which any ſubject can enjoy, or wiſh for, that he cannot be affected either in his property, his liberty, or his perſon, but by the unanimous conſent of 12 of his neighbours and equals. A conſtitution, that I may venture to affirm, has, under Providence, ſecured the juſt liberties of this nation for a long ſucceſſion of ages, and therefore a celebrated French writer (Monteſquieu), who concludes, that becauſe Rome, Sparta, and Carthage, have loſt their liberties, therefore thoſe of England muſt in time periſh, ſhould have recollected, that Rome, Sparta, and Carthage, at the time when their liberties were loſt, were ſtrangers to the trial by jury." This trial by jury, which is the grand bulwark of our liberties, as Engliſhmen, is ſecured to us by the great charter, 9 Hen. III. c 19. The antiquity and excellence of this trial, for the ſettling of civil property, have been already briefly ſtated. But if it has ſo great advantage in regulating civil property, how much muſt that advantage be heightened, when it is applied to criminal caſes! "In times of difficulty and danger," as Blackſtone has well obſerved, "more is to be apprehended from the violence and partiality of judges appointed by the crown, in ſuits between the king and the ſubject, than in diſputes between one individual and another, to ſettle the metes and boundaries of private property. Our law has therefore wiſely placed this ſtrong and twofold barrier, of a preſentment and a trial by jury, between the liberties of the people, and the prerogative of the crown."—"The founders of the

Engliſh law have with excellent forecaſt contrived, that no man ſhould be called to anſwer to the king for any capital crime, unleſs upon the preparatory accuſation of 12 or more of his fellow-ſubjects, the grand jury; and that the truth of every accuſation, whether preferred in the ſhape of indictment, information, or appeal, ſhould afterwards be confirmed by the unanimous ſuffrage of 12 of his equals and neighbours, indifferently choſen, and ſuperior to all ſuſpicion. So that the liberties of England cannot but ſubſiſt, ſo long as this *palladium* remains ſacred and inviolate: not only from all open attacks, (which none will be ſo hardy as to make), but alſo from all ſecret machinations, which may ſap and undermine it; by introducing new and arbitrary methods of trial, by juſtices of the peace, commiſſioners of the revenue, and courts of conſcience. And however *convenient* theſe may appear at firſt, (as, doubtleſs, all arbitrary powers, well executed, are the moſt *convenient*,) yet let it be again remembered, that delays, and little inconveniences in the forms of juſtice, are the price that all free nations muſt pay for their liberty in more ſubſtantial matters; that theſe inroads upon this ſacred bulwark of the nation are fundamentally oppoſite to the ſpirit of our conſtitution; and that, though begun in trifles, the precedent may gradually increaſe and ſpread, to the utter diſuſe of juries in queſtions of the moſt momentous concern."

In criminal caſes, it is provided by the equity and lenity of the Engliſh laws, that no man ſhould be called to anſwer for any capital crime, unleſs, as we have already ſtated, upon the preparatory accuſation of twelve or more of his fellow-ſubjects, called the *grand* jury. This jury conſiders all bills of indictment againſt criminals preferred to the court, which they either approve or find, by writing upon them *billa vera*, or diſallow, by indorſing *ignoramus*, and generally conſiſts of gentlemen that are freeholders of ſuperior quality to thoſe who form the *petit* jury, who try the priſoners indicted by the other jury, and convict them by verdict.

When a priſoner, on his arraignment, has pleaded not guilty, and for his trial hath put himſelf upon the country, which country the jury are, the ſheriff of the county muſt return a panel of jurors that are freeholders, without juſt exception, and of the *viſne*, or neighbourhood, *i. e.* of the county where the fact is committed. If the proceedings are before the court of king's bench, there is a time allowed, between the arraignment and the trial, for a jury to be impanelled by a writ of *venire facias* to the ſheriff, as in civil cauſes; and the trial in caſe of a miſdemeſnor, is had at *niſi prius*, unleſs it be of ſuch conſequence as to merit a trial at bar; which is always invariably had, when the priſoner is tried for any capital offence. But, before commiſſioners of *oyer and terminer*, and gaol delivery, the ſheriff, by virtue of a general precept, directed to him beforehand, returns to the court a panel of forty-eight jurors, to try all felons that may be called upon their trial at that ſeſſion; and, therefore, it is uſual to try all felons immediately, or ſoon after their arraignment. But perſons indicted of ſmaller miſdemeſnors, uſually give ſecurity to the court to appear, for trial at the next aſſizes or ſeſſion. See INDICTMENT.

When the trial is called on, the jurors are to be ſworn, as they appear to the number of twelve, unleſs they are challenged by the party. (See CHALLENGE, & *ſupra*.) *Tales* may be awarded as in civil cauſes, till the number of twelve is ſworn, "well and truly to try, and true deliverance make, between our ſovereign lord the king, and the priſoner whom they have in charge; and a true verdict to give, according to the evidence." When the jury is ſworn, if it be a cauſe of any conſequence, the indictment is uſually opened, and the evidence ſtated by the counſel for the crown, or proſecution. But it is a ſettled rule at common law (inconſiſtent, indeed, with the humane treatment of priſoners by the Engliſh laws, but palliated by the declaration of law, that the judge ſhall be counſel for the priſoner, *i. e.* ſhall ſee that the proceedings againſt him are legal and ſtrictly regular) that no counſel ſhall be allowed a priſoner upon his trial, upon the general iſſue, in any capital crime, unleſs ſome point of law ſhould ariſe proper to be debated. (2 Hawk. P.C. 400.) However, the judges never ſcruple to allow a priſoner counſel to ſtand by him at the bar, and inſtruct him what queſtions to aſk, or even to aſk queſtions for him, with reſpect to matters of fact; for as to matters of law, ariſing on the trial, they are entitled to the aſſiſtance of counſel. When the evidence on both ſides is cloſed, the jury cannot be diſcharged, (unleſs in caſes of evident neceſſity,) till they have given in their verdict; but are to conſider of it and deliver it in, with the ſame forms as upon civil cauſes; only that they cannot, in a criminal caſe, give a privy verdict. (2 Hal. P. C. 300. 2 Hawk. P. C. 439.) But an open verdict may be either general, guilty or not guilty; or ſpecial, ſetting forth all the circumſtances of the caſe, and praying the judgment of the court, whether, for inſtance, on the facts ſtated, it be murder, manſlaughter, or no crime at all. (See VERDICT and JURORS.) If the jury find the priſoner not guilty, he is then for ever diſcharged of the accuſation, except he be appealed of felony within the time limited by law. (See APPEAL.) And upon ſuch his acquittal, or diſcharge for want of proſecution, he ſhall be immediately ſet at large, without payment of any fee to the gaoler. (Stat. 14 Geo. III. c. 20.) But if they find him guilty, he is ſaid to be *convicted* of the crime whereof he ſtands indicted. On a conviction for any felony, in general, the reaſonable expences of proſecution are, by ſtat. 25 Geo. II. cap. 36. and 18 Geo III. c. 19. to be allowed to the proſecutor out of the county ſtock, if he petitions the judge for that purpoſe; and if he be poor, a compenſation for his trouble and loſs of time; and by 27 Geo. II. cap. 3. explained by ſtat. 18 Geo. III. c. 19. poor perſons bound over to give evidence are likewiſe entitled to be paid their charges, as well without conviction as with it. Moreover, on a conviction of larceny in particular, the proſecutor ſhall have reſtitution of his goods, by 21 Hen. VIII. cap. 11. which enacts, that if any perſon be convicted of larceny by the evidence of the party robbed, he ſhall have full reſtitution of his money, goods, and chattels; or the value of them out of the offender's goods, if he has any, by a writ to be granted by the juſtices; and this writ ſhall reach the ſtolen goods, though the property of them is transferred to another by ſale in open market. (1 Hal. P.C. 543.) Without ſuch writ of reſtitution, the party may peaceably retake his goods whereſoever he finds them. And if the felon be convicted and pardoned, or allowed his clergy, the party robbed may bring his action of trover againſt him for his goods, and recover a ſatisfaction in damages. Such are the proceedings and conſequences of a trial by jury in criminal caſes. See Blackſt. Comm. book iii. iv.

JURY, *Special*. Where it is conceived that an indifferent impartial jury will not be returned between party and party by the ſheriff, the court upon motion will order the ſheriff to attend the ſecondary of the king's bench, with his book of freeholders of the county; and the ſecondary, in the preſence of the attornies on both ſides, is to ſtrike a jury. And when a cauſe of conſequence is to be tried at the bar, the court of king's bench, on motion and aſſidavit made, will make a rule for the ſecondary to name forty-eight freeholders; and each party is to ſtrike out twelve, one at a time, the plaintiff, or his attorney, beginning firſt; and from the remainder the jury for the trial are to be drawn. This is called a *ſpecial* jury.

By the ſtat. 3 Geo. II. cap. 25. either party is entitled upon motion to have a ſpecial jury ſtruck upon the trial of any iſſue, as well at the aſſizes as at bar; he paying the extraordinary expence, unleſs the judge's writ certify, in purſuance of the ſtat. 24 Geo. II. cap. 18. that the cauſe required ſuch ſpecial jury. And no perſon ſerving on a ſpecial jury ſhall be allowed more than the ſum which the judge ſhall think reaſonable, not exceeding one guinea, except in caſes where a view is directed. When any ſpecial jury ſhall be ordered by rule of the court of Weſtminſter, in any cauſe ariſing in any city, &c. the jury is to be taken out of liſts, or books of perſons qualified, which ſhall be produced by the ſheriffs, &c. before the proper officer. The ſame indulgence is granted both to merchants and foreigners; for where two merchants are plaintiff and defendant, a jury of merchants may be returned to try the iſſue between them; and if either of the parties in the ſuit be an alien, the jury, at the deſire of the party, is to be compoſed of half foreigners and half Engliſh.

JURIES, *Clerk of the.* See CLERK.

JURY *of Matrons.* See MATRONS.

JURY-MAST, an appellation given by ſeamen to a temporary or occaſional maſt, patched up of yards, or other pieces of timber, and ſet up in the room of a true maſt, which has been loſt in a fight, or by a ſtorm.

JURZEC, in *Geography*, a town of Lithuania, in the palatinate of Minſk; 20 miles N. of Rohaczow.

JUS, and JURA. See LAW, RIGHT, &c.

JUS *accreſcendi*, in *Law*, is the right of ſurvivorſhip between joint-tenants.

JUS *ad rem*, is an inchoate and imperfect right, ſuch as a parſon promoted to a living acquires by nomination and inſtitution; in contradiſtinction to the *jus in re*, or complete and full right, by corporal poſſeſſion.

JUS *Anglorum*, denotes the law and cuſtoms of the Weſt Saxons, in the time of the heptarchy, by which the people were for a long time governed, and which were preferred before all others.

JUS *coronæ*, *rights of the crown*, is part of the law of England, which differs in many things from the general law concerning the ſubject. Coke on Litt.

The king may purchaſe lands to him and his heirs, but he is ſeiſed thereof in *jure coronæ*; and all the lands and poſſeſſions, whereof the king is thus ſeiſed, ſhall follow the crown in deſcents, &c. See PREROGATIVE.

JUS *curialitatis Angliæ*. See COURTESY.

JUS *duplicatum*. See RIGHT.

JUS *fiduciarium*, in the *Roman Law*, a right in truſt for which there was a remedy in conſcience.

JUS *gentium*, is the law by which kingdoms, and ſociety in general, are governed.

JUS *gladii* is mentioned in our Latin authors, and the Norman laws, where it ſignifies a ſupreme juriſdiction. Camd. And hence it is, that at the creation of an earl, he is ſaid to be *gladio ſuccinctus*, to ſignify that he had a juriſdiction over the county of which he was made earl. See PLEAS *of the Sword*.

JUS *imaginum* was the foundation of civil nobility among the Romans, and denoted having the image of one anceſtor at leaſt, who had borne ſome curule office.

JUS *legitimum*, in the *Roman Law*, a legal right which was remedied by the ordinary courſe of law.

JUS *patronatus*, is a commiſſion granted by the biſhop to ſome perſons to enquire who is the rightful patron of a church. If two patrons preſent their clerks, the biſhop ſhall determine who ſhall be admitted by right of patronage, &c. or commiſſion of enquiry by ſix clergymen and ſix laymen, living near the church; who are to enquire on articles as a jury, whether the church is void? who preſented laſt? who is the rightful patron? &c. But if coparceners ſeverally preſent their clerks, the biſhop is not obliged to award a *jus patronatus*, becauſe they preſent under one title; and are not in like caſes, where two patrons preſent under ſeveral titles. The awarding a *jus patronatus* is not of neceſſity, but at the pleaſure of the ordinary, for his better information who hath the right of patronage: for if he will at his peril take notice of the right, he may admit the clerk of either of the patrons, without a *jus patronatus*.

JUS *precarium*, in the *Roman Law*, a right in courteſy, for which the remedy was only by intreaty or requeſt.

JUS *quale*. See QUALE *jus*.

JUS *togæ*. See TOGA.

JUSKPOUR, in *Geography*, a circar of Hindooſtan, in the country of Oriſſa, bounded on the N. by Surgooja, on the E. by a part of Bahar, on the S. by the circars of Gangpour and Ruttunpour, and on the W. by Ruttunpour. The capital is Odeypour.

JUSOFIE, a town of Arabia, in the province of Hadsjar, on the S. coaſt of the Perſian gulf. N. lat. 25° 34'. E. long. 50° 30'.

JUSQUIAMUS, in *Botany*, a name uſed by ſome authors for the hyoſcyamus, or henbane.

JUSSAUHA, in *Geography*, a town of Hindooſtan, in Moultan; 14 miles W. of Toulomba.

JUSSEY, a town of France, in the department of the Upper Saone, and chief place of a canton, in the diſtrict of Veſoul, ſituated on the Amance; 15 miles N.W. of Veſoul. The place contains 3033, and the canton 14,776 inhabitants, on a territory of 227½ kiliometres, in 22 communes. N. lat. 47° 49'. E. long 5° 59'.

JUSSIÆA, in *Botany*, ſo named by Linnæus, (who, as it appears by his Tour in Lapland, v. 1. 284, had at firſt deſtined for this purpoſe the plant he afterwards called *Sibbaldia*,) in honour of the two illuſtrious brothers Antony and Bernard de Juſſieu. The former was profeſſor of botany at Paris, and wrote numerous papers in the Memoirs of the academy, being alſo the editor of the work of Barrelier. He was born at Lyons in 1686, and died at Paris, where he practiſed medicine, in 1758, aged 72. His brother Bernard, a firſt rate botaniſt, who, as Haller obſerves, was deterred by exceſs of modeſty from giving his ideas to the world, was one of the firſt who laboured at a natural ſyſtem of arrangement. His nephew, the preſent A. L. de Juſſieu, has given us a plan of his method, according to which the garden of Trianon was arranged in 1759, and which in fact laid the foundation of his own celebrated work, publiſhed in 1789. Bernard de Juſſieu was demonſtrator of botany at the Jardin du Roi, and died in 1777, aged 70. A third brother, Joſeph, travelled to South America as a ſurgeon, and ſent home dried ſpecimens of many curious plants.—Linn. Gen. 215. Schreb. 292. Willd. Sp. Pl. v. 2. 574. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 63. Juſſ. 319. Lamarck. Illuſtr. t. 280. Gærtn. t. 31.—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Calycanthemæ*, Linn. *Onagræ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, in five, (ſometimes but four,) ovate, acute, permanent ſegments. *Cor.* of five, (ſometimes but four,) roundiſh, ſpreading, ſeſſile, equal petals. *Stam.* Filaments ten, (ſometimes eight,) very ſhort, thread-ſhaped; anthers roundiſh. *Piſt.* Germen oblong, priſmatic, inferior; ſtyle thread-ſhaped; ſtigma capitate, flat, marked with five ſtreaks. *Peric.* Capſule oblong, angular, of four or five cells, burſting at the angles, crowned with the calyx. *Seeds* numerous, ſmall, ſmooth, and poliſhed, diſpoſed in rows upon the angles of the central column, which are oppoſite to the partitions, the latter originating from the centre of each valve. See GÆRTNER.

Eſſ. Ch. Calyx ſuperior, of four or five leaves. Petals four or five, equal. Capſule of four or five cells, oblong, burſting at the angles; partitions from the middle of the valves. Seeds numerous, minute.

Obſ. Gærtner aſſerts the difference between this genus and *Œnothera* to be merely factitious and imaginary. In our opinion the permanent, leafy, equal calyx, deſtitute of a tube, and the ſmooth, round, not angular nor ſpongy, ſeeds, are ſufficient to mark *Juſſiæa*, not to mention the undivided ſtigma, which in this tribe is perhaps of no great moment.—As to its place in the Linnæan ſyſtem we are leſs decided, and think Lamarck moſt correct in removing it to *Octandria*.

The greater number of the ſpecies are natives of the warmer parts of America; a few are found in the Eaſt Indies, or in Guinea. Linnæus defines five in his *Species Plantarum;* Willdenow has twelve.

1. J. *repens*, Linn. Sp. Pl. 555, (Nir-carambu; Rheede Hort. Mal. v. 2. 99. t. 51.)—Stem creeping. Leaves obovate, obtuſe. Flowers five-cleft. Calyx-leaves lanceolate.—This is truly an Eaſt Indian ſpecies, growing in watery places, and throwing out from its procumbent branched *ſtem*, large tufted fibrous perennial *roots*. The herbage is ſmooth. *Leaves* alternate, ſtalked, obovate, entire, veiny, obtuſe, often emarginate, an inch or more in length. *Flowers* on ſolitary, ſimple, axillary ſtalks, ſhorter than the leaves, but the ripe *fruit* and ſtalk together are about as long as each leaf. Segments of the *calyx* five, lanceolate, narrow, acute, entire. *Petals* five, roundiſh, whitiſh, with orange-coloured claws.—J. *adſcendens*, Linn. Mant. 69, appears to be the very ſame plant, deſcribed from a ſpecimen, whereas J. *repens* was originally taken up from books.

2. J. *inclinata*. Linn. Suppl. 235, (J. erecta; Amoen. Acad. v. 8. 256.)—Stem aſcending. Leaves obovate, obtuſe. Flowers four-cleft. Calyx-leaves elliptical, broad.—Sent from Surinam by Dalberg, being a part of the collection preſerved in ſpirits, which king Guſtavus III. gave Linnæus. The latter at firſt miſtook this ſpecies for a totally different one, *erecta*. It is more akin to *repens*, but larger, and the above ſpecific character ſufficiently marks it. The very broad *calyx-leaves* are remarkable.

3. J. *peruviana*. Linn. Sp. Pl. 555. (Onagra laurifolia, flore amplo pentapetalo; Feuill. Peruv. 716. t. 9, not 11.)—Stem erect. Leaves elliptic-lanceolate, acute, roughiſh. Flowers four or five-cleft. Calyx-leaves ovate, pointed, toothed.—Gathered by Feuillée about the ſides of rivers in the plain of Lima. He reports that the natives highly eſteem the bruiſed leaves, as a cooling application to diſpel tumours. Mutis ſent Linnæus a ſpecimen from Mexico, which anſwers preciſely to Feuillée's plant, except the *flowers* being four-cleft, upon which we lay no ſtreſs. The toothed *calyx* in our's is remarkable. The *petals* are large and yellow. *Leaves* roughiſh with ſhort, rigid, ſcattered hairs; their under ſide pale.

4. J. *hirta*. Willd. n. 6. (Œnothera hirta; Linn. Sp. Pl. 491. Onagra fruteſcens et hirſuta, nerii folio, flore magno luteo; Plum. Ic. 167. t. 174. f. 2.)—Stem erect, hairy. Leaves elliptic-lanceolate, acute; hairy beneath. Flowers four-cleft. Calyx-leaves ovate, pointed, entire.—Known to us only by Plumier's figure, who gathered it in ſome part of South America. If that figure be exact, the entire *calyx*, and more hairy herbage, diſtinguiſh it from the laſt. Willdenow has properly followed Swartz and Vahl in removing it from *Œnothera*.

5. J. *pubeſcens*. Linn. Sp. Pl. 555. Loefl. It. 282. n. 205.—Stem upright, hairy. Leaves oblong. Flowers five or ſix-cleft. Calyx-leaves lanceolate, pointed, hairy beneath.—Gathered by Loefling in South America. We have an unnamed ſpecimen which anſwers well enough to the ſhort accounts of this ſpecies given by authors. Of the ſynonym of Sloane we do not preſume to judge with certainty, but it appears to belong to *J. peruviana*. The *ſtem* of our plant is erect, clothed with looſe, ſpreading, white hairs, as are alſo the *leaves* more or leſs, the long ſlender *germen*, and backs of the *calyx-leaves*. The latter are ſix in every flower we have examined, lanceolate, taper-pointed, wavy, ſcarcely crenate, very ſmooth above. *Petals* ſix, white or yellowiſh. *Leaves* linear-lanceolate, near two inches long, on ſhort hairy ſtalks.

6. J. *ſuffruticoſa*. Linn. Sp. Pl. 555. (Cattu-carambu; Rheede Hort. Mal. v. 2. 97. t. 50.)—Stem erect, much branched. Leaves lanceolate, downy. Flowers four-cleft. Calyx-leaves ovate, downy beneath.—Native of the Eaſt Indies, flowering during the rainy ſeaſon. The whole plant, two or three feet high, is uſually clothed with denſe ſoft pubeſcence, though occaſionally nearly ſmooth. *Leaves* numerous, lanceolate, almoſt ſeſſile, about two inches long. *Fruit* nearly as long. The ovate four-leaved *calyx*, downy, not hairy, beneath, eſſentially diſtinguiſhes it from the laſt. Linnæus adopted this ſpecies from books; and though he had ſpecimens, never rightly determined them.

7. J. *octovalvis*. Swartz. Obſ. 142. (Œnothera octovalvis; Jacq. Amer. 102. t. 70. Linn. Sp. Pl. 492. Onagra foliis perſicariæ anguſtioribus, flore magno luteo; Plum. Ic. 168. t. 175. f. 1.)—Stem erect. Leaves lanceolate, downy. Flowers four-cleft. Calyx-leaves ovate. Capſule of eight valves. Native of wet places in the Weſt Indies. This ſeems to be the plant incorrectly figured by Merian, Inſ. Surin. t. 39. There is great difficulty in diſtinguiſhing it ſpecifically from the laſt, as we have ſeen no ſpecimen, but we have no doubt of their being different. The preſent is ſaid to be an annual plant. The *petals* are yellow, and inverſely heart-ſhaped.

8. J. *erecta*. Linn. Sp. Pl. 556. Swartz. Obſ. 173. (Onagra foliis perſicæ amplioribus, parvo flore luteo; Plum. Ic. 168. t. 175. f. 2. Carambu; Rheede Hort. Mal. v. 2. 95. t. 49.)—Stem erect. Leaves lanceolate, ſmooth. Flowers four-cleft, ſeſſile. Calyx-leaves lanceolate.—Native of marſhy places in both Indies. The *root* is ſaid to be annual. Whole plant ſmooth or nearly ſo. *Leaves* two or three inches long, ſtalked, lanceolate, pointed. *Flowers* ſmall, yellow, axillary, ſeſſile. *Calyx-leaves* ſlightly downy and three-ribbed beneath. *Fruit* obovate, not an inch long, the membranous ſides, between the ribs, becoming torn to let out the ſeeds.

9. J. *acuminata*. Swartz. Ind. Occ. v. 2. 745.—Nearly erect, ſmooth. Leaves lanceolate, broad, tapering at each end. Flowers four-cleft, nearly ſeſſile.—In low ground in the ſouth part of Jamaica, but rare. *Swartz*. This differs from the laſt in the ſingularly taper-pointed *leaves*, and in the *ſtem* being decumbent at its baſe.—The *calyx-leaves*, moreover, are deſcribed as ſomewhat ovate.

10. J. *tenella*. Burm. Ind. 103. t. 34. f. 2.—Erect, ſmooth. Leaves lanceolate, oppoſite. Flowers five-cleft, nearly ſeſſile.—Native of Java. A ſmall plant much branched. *Leaves* (according to Burmann) oppoſite, an inch long. The Camaranbaya of Marcgrave, 30, f. 1, which he quotes, is more like *J. octovalvis*.

11. J. *linearis*. Willd. n. 3.—Leaves linear, ſeſſile,

hiſpid. Flowers four-cleft.—Native of Guinea. *Stem* erect, branched, ſmooth, ſtriated, round, clothed with ſcattered hairs at the top. *Leaves* two inches or more in length, bluntiſh, ſeſſile, alternate, ſcarcely veiny, rough with minute, rigid, upright hairs. *Flowers* ſeſſile, axillary. *Germen* hiſpid.

12. J. *linifolia.* Vahl. Eclog. v. 2. 32. Willd. n. 4. Leaves and calyx-leaves linear-lanceolate, ſmooth. Flowers ſeſſile, four-cleft.—Native of South America. *Stem* herbaceous, erect, ſlender, ſmooth, branched, angular. *Leaves* nearly ſeſſile, ſcarcely an inch long, narrow, tapering at each end. *Flowers* axillary. *Leaves* of the calyx four, lanceolate, tapering, about one-fourth of an inch long. *Capſule* an inch long, ſlender, round and ſmooth. *Vahl.* S.

JUST, the meaſured can or cup out of which the monks uſed to drink their liquor. It appears from the Monaſticon, that the monks of Eveſham Abbey were allowed two juſts of beer every day; and we are informed by William of Malmſbury, that thoſe of Glaſtonbury, about the time of the Conqueſt, had their juſts filled with hydromel or mead on great feſtival days.

Just, a ſportive kind of combat on horſeback; man againſt man, armed with lances.

The word is by ſome derived from the French *jouſte*, of the Latin *juxta*, becauſe the combatants fought near one another. Salmaſius derives it from the modern Greek *Zouſtra*, or rather τζȣςρα; which is uſed in this ſenſe by Nicephorus Gregoas. Others derive it from *juſta*, which, in the corrupt age of the Latin tongue, was uſed for this exerciſe, becauſe it was ſuppoſed a more juſt and equal combat than the tournament.

Anciently, juſts and tournaments made a part of the entertainment at all ſolemn feaſts and rejoicings. The Spaniards borrowed theſe exerciſes from the Moors, and called them *juego de cannas*, *reed* or *cane-play*. Some take them to be the ſame with *ludus Trojanus*, anciently practiſed by the youth of Rome.

The Turks uſe them ſtill, and call them *lancing the gerid*.

The difference between juſts and tournaments conſiſts in this, that the latter is the genus, of which the former is only a ſpecies. Tournaments included all kinds of military ſports and engagements, which were made out of gallantry and diverſion. Juſts were thoſe particular combats where the parties were near each other, and engaged with lance and ſword; add, that the tournament was frequently performed by a number of cavaliers, who fought in a body; the juſt was a ſingle combat of one man againſt another. Though the juſts were uſually made in tournaments, after a general rencounter of all the cavaliers, yet they were ſometimes ſingly, and independent of any tournament.

He who appeared for the firſt time at a juſt, forfeited his helm, or caſque, unleſs he had forfeited before at a tournament.

Just *Appui*. See Appui.

Just, in *Biography*, a graceful and pleaſing compoſer of ſhort and eaſy progreſſive leſſons for beginners on the harpſichord or pianoforte, in Holland, about 30 years ago.

Just, *St.*, in *Geography*, a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Clermont; 9 miles N. of Clermont. The place contains 823, and the canton 10,620 inhabitants, on a territory of 202½ kiliometres, in 22 communes.—Alſo, a town of France, in the department of the Marne; 10 miles S.S.E. of Sezanne.—Alſo, a town of France, in the department of the Aveiron; 6 miles S.S.E. of Sauveterre.

Just *en Chevalet, St.*, a town of France, in the department of the Loire, and chief place of a canton, in the diſtrict of Roanne; 12 miles S.W. of Roanne. The place contains 2346, and the canton 9149 inhabitants, on a territory of 217½ kiliometres, in 8 communes.

JUSTABAS, a town of South America, in the province of Tucuman; 45 miles N.W. of St. Fernando.

JUSTELL, Christopher, in *Biography*, was born at Paris in 1580. Having laid a good foundation in elementary learning at ſchool and at college, he applied his maturer ſtudies to eccleſiaſtical hiſtory, and became the author of many learned works. He died at the age of 69 in the year 1649. His principal pieces are, "Codex Canonum Eccleſiæ Univerſæ à concilio Calchedonenſi et Juſtiniano Imp. Confirmatus Gr. et Lat.;" "Codex Canonum Eccleſiaſticorum Dionyſii Exigui," &c.; "Codex Canonum Eccleſiæ Africanæ, Gr. et Lat.;" "Bibliotheca Juris Canonici Veteris;" "A Genealogical Hiſtory of the Houſe of Auvergne," &c. Juſtell was ſuppoſed to be better acquainted with the civil hiſtory and antiquities of the middle age than any perſon of his time. He kept up a correſpondence with moſt of the literary characters of his time, among whom were archbiſhop Uſher and ſir Henry Spelman.

JUSTICE, in a general ſenſe, or *univerſal* juſtice, comprehends the whole duty of man to God, to his neighbour, and to himſelf. In this latitude the term "righteouſneſs" often occurs in ſcripture. Cicero was not ignorant (De Nat. Deor. l. i. § 41.) that juſtice expreſſes more than the performance of the duties owing to our fellow-creatures; for according to his ſtatement, "Eſt enim pietas juſtitia adverſum Deos," *i. e.* Piety is juſtice towards the gods.

Justice, *Juſtitia*, in a more reſtricted ſenſe, and conſidered as a ſocial virtue, denotes a conſtant deſire, or inclination, to give every one his due; or a habit by which the mind is diſpoſed and determined to give every man his own. Accordingly juſtice has a neceſſary reſpect to the perſons and rights of others. As there is a twofold right (ſee Right), there is alſo a correſpondent diſtinction of juſtice. A right is either perfect or imperfect. A *perfect* right is that which perſons have to things properly their own, the rendering of which is the payment of a debt, rather than the conferring of a favour: a right which human laws, as well as divine, generally allow men to challenge, and aſſiſt them to recover. I am not obliged to every one who does not rob or murder me. Thus alſo, the making of a promiſe may be free, but the performance of it is not ſo. An *imperfect* right detracts nothing from the kindneſs, reſpect, and good will of thoſe who give to others what they can only claim by virtue of ſuch a right; but leaves to ſuch actions their full luſtre and merit. Notwithſtanding any ſuch right, men are obliged to their benefactors for doing what they could not have been conſtrained to do, and which demonſtrate the goodneſs and generoſity of their temper; being an act of juſtice, ſo as at the ſame time to have the nature of a gift. The offices of civility, gratitude, and charity reſt on this foundation. Juſtice, grounded on this diſtinction of right, is diſtinguiſhed into *ſimple* and *mixed*; or, according to Puffendorf, *univerſal* and *particular*; or, according to Grotius, *expletory* and *attributive*. By *ſimple* juſtice, we may underſtand juſtice in the ſtricteſt ſenſe of the term, of which Cicero ſays (De Offic. l. iii. c. 6.), "Hæc una virtus omnium eſt domina et regina virtutum;" *i. e.* "It is the miſtreſs and queen of all the other virtues." By *mixed* juſtice, we may underſtand that which has other virtues joined with it, as humanity, liberality, and the like. Thus Cicero ſays (De Offic. l. i.

c. 7, 8.), "Juſtitiæ conjuncta eſt beneficientia:" Beneficence is connected with juſtice. And again, "Injuſtitiæ duo genera," &c. There are two kinds of injuſtice, one of thoſe who do an injury to others; another with which they are chargeable, who neglect to vindicate and defend the injured, when it is in their power. To the ſame purpoſe Antoninus ſays (περι Σεαυτȣ, l. ix. c. 5.), "A man may be unjuſt not only by *doing*, but *neglecting* to do ſomething." Theſe philoſophical writers ſeem evidently to have thought, that the duties of humanity are parts of juſtice properly ſo called. *Simple* juſtice we have already defined, agreeable to the accurate definition of it in the civil law. "Juſtitia eſt conſtans et perpetua voluntas jus ſuum cuique tribuendi:" *i. e.* Juſtice is a conſtant and prevailing will, or diſpoſition, to render to every one his due.

Juſtice doth not derive its being from fear, as is affirmed by Mr. Hobbes, who ſuppoſes mankind in their natural ſtate to have a licence uncircumſcribed by any other bounds, beſides their own natural force. This licence they are induced to exchange for a more limited right in ſociety, to prevent that war of every one with every one, which would be the conſequence of every one's inſiſting upon his natural rights. "According to this hypotheſis," as Dr. Cudworth well obſerves (Intellect. Syſtem), "juſtice and civil government are plainly things not good in themſelves, nor deſirable (being a hindrance of liberty, and nothing but ſhackles and fetters), but by accident only, as neceſſary evils. They are leſſer evils ſubmitted to purely for the ſake of avoiding a greater. Hence it inevitably follows, that all men muſt be ακοντες δικαιοι, unwillingly juſt, or not with a full and perfect, but mixed will only." The true principles of juſtice are ſuch as theſe: It is reaſonable that *his* will, who is the common father of mankind, ſhould be the meaſure of their behaviour one towards another. It can never be thought a thing pleaſing to God, who has originally the ſame affection for one as for another, that one man, by fraud or violence, ſhould uſurp dominion over another, or any way moleſt or hinder him. Beſides, this would introduce confuſion into his works, the glory of which is their order and harmony. "If it be the diſpoſition of mankind," ſays Cicero (De Offic. l. iii. § 5.), that every one for his own advantage ſhould oppreſs and rob his neighbour, it is neceſſary that ſociety, which is the moſt natural ſtate of mankind, be entirely diſſolved. Juſt as in the human body, the whole muſt be weakened and deſtroyed, if every member could have this perſuaſion, and act upon it; that it ſhould flouriſh by drawing to itſelf the ſtrength and nouriſhment of the member neareſt to it." Thus from that original and univerſal ſociety to which all mankind belong, neceſſarily flow obligations to mutual juſtice; and Mr. Hobbes's ſtate of war appears to contradict the very firſt view of human nature. But beſides this general ſociety, particular civil ſocieties have, by the direction of nature, been erected in ſeveral parts of the world. The Author of nature has formed his rational creatures with a ſtrong bent and inclination to combine into bodies politic. It is inclination, therefore, which makes men ſeek ſociety, not the bare proſpect of benefiting themſelves by it; to ſatisfy nature more than to defend themſelves from violence. When ſocieties are formed, though juſtice be neceſſary to make them flouriſh, and hence we infer the will of the great governor of the world; yet in the nature of things, the obligation to juſtice is antecedent to any ſociety whatſoever. From the inclination to ſociety with which God hath made man, we infer his will to be, that juſtice ſhould be cultivated, which is neceſſary to the ſupport of ſociety; but civil ſociety is not the original of juſtice. Another principle of juſtice is, that the good of the whole is to be preferred before the good of any one part. Is it good, pleaſing to a moſt benevolent creator, and conſequently deſerving the approbation and concurrence of every rational agent, that *this* or *that* man ſhould be happy? It is much better that a greater number, and beſt of all that all ſhould be ſo. But how can all men be made happy, without a conſtant regard to the rules of juſtice. Biſhop Cumberland (De Legibus Naturæ, cap. i. § 23.) not only reſolves juſtice, with the ſeveral duties annexed to it, into this principle, but even the right of ſelf-preſervation. Farther, it is altogether reaſonable, that we ſhould, or ſhould not do to another, what we would, or would not that he ſhould do unto us. Every man is agreed to think every other man unjuſt, who deprives him of any good thing which he lawfully enjoys. We ſhould therefore conſider, that others may reaſonably expect of us, whatever we may reaſonably demand from them. Moreover, all men have their rights and properties. He that is born to leaſt, is born with a right to life, liberty, and ſafety. If there be right, there muſt be juſtice: theſe mutually ſuppoſe one another. Again, whatever is enjoyed or poſſeſſed by a moral agent, independently of another, may be uſed, enjoyed, and encouraged, without being ſubject to the controul of that other; provided that the poſſeſſor has not alienated or forfeited his right; and that he uſes it not to the prejudice of any other perſon. Upon this principle is founded the natural equality of mankind, that is, an equality of right. This equality ſubſiſts in all the eſſentials of being and happineſs, under all the changes of condition to which every man is liable. Let a man's condition be what it will, high or low, rich or poor, a prince or a ſubject, as he has an equal right to what he lawfully poſſeſſes, with that which any other man can have; ſo there are certain poſſeſſions, the right of which he cannot transfer to another; of which number are life, limbs, and liberty, both civil and religious: in all which reſpects, therefore, the meaneſt perſon, while innocent, is equal to the greateſt among men. Mr. Hobbes indeed (De Cive, l. i. c. 1. § 3.) proves the equality of mankind from the equal power they have of doing miſchief. M. Barbeyrac obſerves, that this equality may be called an equality purely phyſical; whereas it is a moral equality, or an equality of right, that muſt be laid as the foundation of juſtice. Puffendorf deduces this equality of mankind from the ſameneſs of nature; which ſeems to make it, as well as that of Mr. Hobbes, a phyſical equality. Of Mr. Godwin's ſentiments concerning the ſubject under preſent diſcuſſion, we ſhall probably have occaſion to give ſome account under the articles POLITICS, SOCIETY, and VIRTUE.

Having briefly ſtated the great principles of juſtice, we ſhall now proceed to the diviſion of it. According to Ariſtotle, juſtice is *univerſal* or *particular*. *Univerſal* juſtice conſiſts in the obſervance of the laws, which extend to all the actions of mankind capable of good or evil, and thus comprehends all the virtues. Hence aroſe the common ſaying, "Εν δε δικαιοσυνη συλληβδην πασ᾽ Αρετη εστι," that is, all virtue is included in righteouſneſs. *Particular* juſtice reſpects the *rights* of other men, and conſiſts in the obſervance of equality, or in challenging no more than our own; and in giving to others what is theirs. Particular, or ſimple juſtice is either *diſtributive* or *commutative*. *Diſtributive* juſtice is concerned in the diſtribution of honour, money, or whatever elſe is to be divided among the members of a ſociety, for in all theſe there is room for equality or inequality; and therefore to diſtribute as we ought is a part of juſtice. In other words, it is concerned in matters of government, and of beneficence; and is either remuneratory, or punitive: it obſerves an equality in dealing rewards and puniſhments, according to each man's condition and merit; for as actions are either good or evil, for the good, rewards muſt be aſſigned; and for the evil, puniſhments; and herein a geometrical proportion is obſerved. *Commutative* juſtice ſuperintends the management and diſpoſal of ſuch things as enter into compacts and agreements; or it is converſant in matters of commerce, and in the equal commutation, or changing, of things; and proceeds according to arithmetical equality, without any regard to perſons and circumſtances. To which we may add *legal* juſtice, that which reſides in the ſtate, or monarch, by whoſe power and authority the effects of commutative and diſtributive juſtice are frequently ſuperſeded, or ſuſpended; as in a dearth of corn, if a perſon that has a ſtock by him will not ſell it, it ſhall be taken from him; and the like.

Dr. More diſtributes juſtice into *ethical, economical,* and *political;* the firſt conſiders all mankind as on a level; the ſecond regards them as aſſociated into families under the ſeveral relations of huſband and wife, parents and children, maſters and ſervants; and the third comprehends them as united into public ſtates, and obliged to certain duties, either as magiſtrates or people.

The precepts of juſtice, ſays the civil law, are theſe, *viz.* "honeſté vivere, alterum non lædere, ſuum cuique tribuere;" that is, to live honeſtly, to injure no one, and to render to all their due. The two laſt precepts belong to ſtrict juſtice, and theſe may accordingly furniſh a diſtinction of juſtice into *negative* and *poſitive*. *Negative* juſtice denotes every man's right to exemption from injurious actions; and *poſitive* juſtice comprehends the performance of all thoſe actions, which by contract, or any other way, are due to him. Some diſtinguiſh between "injuſtitia" and "injuria." Injuſtice is oppoſed to juſtice in general, whether negative or poſitive; an injury to negative juſtice alone. A perſon may be injured in his mind or ſoul, his body, his name, his relations, and his eſtate. (See INJURY.) *Poſitive* juſtice is the rendering to all their dues; and things may be due by a natural or an acquired right. (See RIGHT and PROPERTY.) On the ſubject of this article, ſee Grove's Syſtem of Moral Philoſophy, vol. ii. and the authors to whom he refers.

JUSTICE, *Hand of.* See HAND.

JUSTICE, *Officers of.* See OFFICERS.

JUSTICE *Poetical.* See POETICAL.

JUSTITIAM, *Temperamentum ad.* See TEMPERAMENTUM.

JUSTICE, *Juſtitiarius,* is likewiſe an officer appointed by the king or commonwealth, to do right by way of judgment.

He is called *juſtice,* not *judge;* anciently *juſtitia,* not *juſtitiarius,* becauſe he has his authority by deputation, as delegate to the king, and not *jure magiſtratus;* ſo that he cannot depute any other in his ſtead, the juſtice of the foreſt only excepted.

Of theſe juſtices we have various kinds in England; *viz.*

JUSTICE *of the King's Bench, Chief,* is the capital juſtice of Great Britain, and is a lord by his office. His buſineſs is chiefly to hear and determine all pleas of the crown; that is, ſuch as concern offences againſt the crown, dignity, and peace of the king; as treaſons, felonies, &c.

This officer was formerly not only chief juſtice, but alſo chief baron of the exchequer, and maſter of the court of wards. He uſually ſat in the king's palace, and there executed that office, formerly performed *per comitem palatii;* he determined in that palace all the differences happening between the barons and other great men.

He had the prerogative of being vicegerent of the kingdom, whenever the king went beyond ſea, and was uſually choſen to that office out of the prime nobility; but his power was reduced by king Richard I. and king Edward I. His office is now divided, and his title changed from *capitalis Angliæ juſtitiarius,* to *capitalis juſtitiarius ad placita, coram rege tenenda,* or *capitalis juſtitiarius banci regii.* See COURT *of king's bench.*

JUSTICE *of the Common Pleas, Chief,* he who, with his aſſiſtants, hears and determines all cauſes at the common law, that is to ſay, all civil cauſes, between common perſons, as well perſonal as real; and he is alſo a lord by his office. See COURT *of Common Pleas.*

JUSTICE *of the Foreſt,* is a lord by his office, who has power and authority to determine offences committed in the king's foreſts, &c. which are not to be determined by any other court, or juſtice.

Of theſe there are two; whereof one has juriſdiction over all the foreſts on this ſide Trent, and the other beyond it.

By many ancient records, it appears to be a place of great honour and authority, and is never beſtowed but on ſome perſon of great diſtinction. The court where this juſtice ſits, is called the *juſtice ſeat of the foreſt,* held once every three years, of which 40 days' notice ought to be given, for hearing and determining all treſpaſſes within the foreſt, and all claims of franchiſes, liberties, and privileges, and all pleas and cauſes whatſoever therein ariſing. (4 Inſt. 291.) This court may fine and impriſon for offences within the foreſt (4 Inſt. 313.), it being a court of record; and therefore a writ of error lies from hence to the court of king's bench. The laſt court of juſtice ſeat of any note was that held in the reign of Charles I. before the earl of Holland. After the Reſtoration another was held, for form ſake, before the earl of Oxford; but ſince the Revolution in 1688, the foreſt laws have fallen into total diſuſe, to the great advantage of the ſubject.

This is the only juſtice who may appoint a deputy: he is alſo called *juſtice in eyre of the foreſt.*

JUSTICES *of Aſſize,* were ſuch as were wont, by ſpecial commiſſion, to be ſent into this or that county, to take aſſiſes, for the eaſe of the ſubjects.

For whereas theſe actions paſs always by jury, ſo many men might not, without great damage and charge, be brought up to London; and therefore juſtices, for this purpoſe, by commiſſions particularly authorized, were ſent down to them.

Theſe continue to paſs the circuit, by two and two, twice every year, through all England, except the four northern counties, where they go only once, diſpatching their ſeveral buſineſſes by ſeveral commiſſions; for they have one commiſſion to take aſſiſes, another to deliver gaols, and another of oyer and terminer. In London and Middleſex a court of general gaol-delivery is held eight times in the year.

All the juſtices of peace of any county wherein the aſſiſes are held, are bound by law to attend them, or elſe are liable to a fine, in order to return recognizances, &c. and to aſſiſt the judges in ſuch matters as lie within their knowledge and juriſdiction, and in which ſome of them have been probably concerned, by way of previous examination. See ASSISES and JURY.

JUSTICES *in Eyre, juſticiarii itinerantes,* or *errantes,* were thoſe who were anciently ſent with commiſſion into divers counties, to hear ſuch cauſes eſpecially as were termed *pleas of the crown;* and that for the eaſe of the ſubject, who muſt elſe have been hurried to the courts of Weſtminſter if the cauſe were too high for the county courts.

According to ſome, theſe juſtices were ſent once in ſeven years; but others will have them to have been ſent oftener. Camden ſays, they were inſtituted in the reign of king Henry II. A. D. 1184; but they appear to be of an older date.

They were ſomewhat like our juſtices of aſſiſe at this day; though for authority, and manner of proceeding, very different.

JUSTICES *of Gaol-delivery*, thoſe commiſſioned to hear and determine cauſes appertaining to ſuch as, for any offence, are caſt into priſon.

Juſtices of gaol-delivery are empowered by the common law to proceed upon indictments of felony, treſpaſs, &c. and to order execution or reprieve; and they have power to diſcharge ſuch priſoners as upon their trials ſhall be acquitted; alſo all ſuch againſt whom on proclamation made, no evidence appears to indict; which juſtices of oyer and terminer, &c. may not do. (2 Hawk. 24, 25.) But theſe juſtices have nothing to do with any perſon, not in the cuſtody of the priſon, except in ſome ſpecial caſes; as if ſome of the accomplices to a felony may be in ſuch priſon, and ſome of them out of it, the juſtices may receive an appeal againſt thoſe who are out of the priſon as well as thoſe who are in it; which appeal after the trial of ſuch priſoners, ſhall be removed into B. R. and proceſs iſſue from them againſt the reſt. But if thoſe out of priſon be omitted in the appeal, they can never be put into any other; becauſe there can be but one appeal for one felony.

In this way the gaols are cleared, and all offenders tried, puniſhed, or delivered, twice in every year.

Their commiſſion is now turned over to the juſtices of aſſiſe. See GAOL-*delivery*.

JUSTICES *of Niſi Prius*, are now the ſame with juſtices of aſſiſe. It is a common adjournment of a cauſe in the common pleas, to put it off to ſuch a day, *Niſi prius juſtitiarii venerint ad eas partes ad capiendas aſſiſas:* from which clauſe of adjournment they are called *juſtices of niſi prius*, as well as *juſtices of aſſiſe*, on account of the writ and actions they have to deal in. See NISI *Prius*, and JURY.

JUSTICES *of Oyer and Terminer*, were juſtices deputed on ſome ſpecial occaſions to hear and determine particular cauſes.

The commiſſion of oyer and terminer is directed to certain perſons, upon any inſurrection, heinous demeanour, or treſpaſs committed, who muſt firſt enquire, by means of the grand jury or inqueſt, before they are empowered to hear and determine by the help of the petit jury. It was formerly held, that no judge or other lawyer could act in the commiſſion of oyer and terminer, or in that of gaol-delivery, within the county where he was born or inhabited; but it was thought proper by 12 Geo. II. cap. 27, to allow any man to be a juſtice of oyer and terminer and general gaol-delivery, within any county of England.

JUSTICES *of the Peace*, are perſons of intereſt and credit, appointed by the king's commiſſion to keep the peace of the county where they live.

Of theſe, ſome, for ſpecial reſpect, are made of the quorum, ſo as no buſineſs of importance may be diſpatched without the preſence, or aſſent, of them, or one of them. Now the practice is to advance almoſt all of them to that dignity, naming them all over again in the *quorum* clauſe except perhaps only ſome inconſiderable perſon for the ſake of propriety; and no exception is now allowable, for not expreſſing in the form of the warrants, &c. that the juſtice who iſſued them is of the *quorum*. Whenever any juſtice intends to act under this commiſſion, he ſues out a writ of "dedimus poteſtatem" from the clerk of the crown in chancery, empowering certain perſons therein named, to adminiſter the uſual oaths to him; which done he is at liberty to act. Every juſtice of peace hath a ſeparate power, and his office is to call before him, examine, iſſue warrants for apprehending, and commit to priſon, all thieves, murderers, wandering rogues; thoſe that hold conſpiracies, riots, and almoſt all delinquents which may occaſion the breach of the peace, and quiet of the ſubject; to commit to priſon ſuch as cannot find bail, and to ſee them brought forth in due time to trial; and bind over the proſecutors to the aſſiſes. And if they neglect to certify examinations and informations to the next gaol-delivery, or do not bind over proſecutors, they ſhall be fined. A juſtice may commit a perſon that doth a felony in his own view, without warrant; but if on the information of another, he muſt make a warrant under hand and ſeal for that purpoſe. If a complaint and oath be made before a juſtice of goods ſtolen, and the informer, ſuſpecting that they are in a particular houſe, ſhews the cauſe of his ſuſpicion, the juſtice may grant a warrant to the conſtable, &c. to ſearch in the place ſuſpected, to ſeize the goods and perſon in whoſe cuſtody they are found, and bring them before him or ſome other juſtice. The ſearch on theſe warrants ought to be in the day-time, and doors may be broke open by conſtables to take the goods. Juſtices of peace may make and perſuade an agreement in petty quarrels and breaches of the peace, where the king is not entitled to a fine, though they may not compound offences, or take money for making agreements. A juſtice hath a diſcretionary power of binding to the good behaviour, and may require a recognizance, with a great penalty, of one, for his keeping of the peace, where the party bound is a dangerous perſon, and likely to break the peace, and do much miſchief; and for default of ſureties, he may be committed to gaol. But a man giving ſecurity for keeping the peace in the king's bench or chancery, may have a *ſuperſedeas* to the juſtices in the country not to take ſecurity; and alſo by giving ſurety of the peace to any other juſtice. If one make an aſſault upon a juſtice of peace, he may apprehend the offender and commit him to gaol till he finds ſureties for the peace; and a juſtice may record a forcible entry on his own poſſeſſion: in other caſes he cannot judge in his own cauſe. Contempts againſt juſtices are puniſhable by indictment and fine at the ſeſſions. Juſtices ſhall not be regularly puniſhed for any thing done by them in ſeſſions as judges; and if a juſtice be tried for any thing done in his office, he may plead the general iſſue, and give the ſpecial matter in evidence: and if a verdict is given for him, or the plaintiff be non-ſuited, he ſhall have double coſts; and ſuch action ſhall only be laid in the county where the offence was committed. (7 Jac. cap. 5. 21 Jac. cap. 12.) But if they are guilty of any miſdemeanor in office, information lies againſt them in the king's bench, where they ſhall be puniſhed by fine and impriſonment: and all perſons who recover a verdict againſt a juſtice, for any wilful or malicious injury, are entitled to double coſts. By 24 Geo. II. cap. 44. no writ ſhall be ſued out againſt any juſtice of peace, for any thing done by him in the execution of his office, until notice in writing ſhall be delivered to him one month before the ſuing out of the ſame, containing the cauſe of action, &c. within which month he may tender amends; and if the tender be found ſufficient, he ſhall have a verdict, &c. Nor ſhall any action be brought againſt a juſtice for any thing done in the execution of his office, unleſs commenced within ſix months after the act committed.

A juſtice is to exerciſe his authority only within the county where he is appointed by his commiſſion, not in any city which is a county of itſelf, or town corporate, having their proper juſtices, &c. but in other towns and liberties he may. The power and office of juſtices terminate in ſix months after the demiſe of the crown (1 Ann. cap. 8.), by an expreſs writ of diſcharge under the great ſeal, by writ of *ſuperſedeas*, by a new commiſſion, by the acceſſion of the office of ſheriff or coroner.

If the ſame juſtice, whoſe office ceaſes on the demiſe of the crown, be put in commiſſion by the ſucceſſor, he ſhall not be obliged to ſue out a new *dedimus*, or to ſwear to his qualification afreſh (ſtat. 1 Geo. III. c. 13.); nor, by reaſon of any new commiſſion, to take the oaths more than once in the ſame reign. In caſe of a *ſuperſedeas*, the power of the juſtices may be revived again by another writ, called a *procedendo*. Formerly it was thought, that if a man was named in any commiſſion of the peace, and had afterwards a new dignity conferred upon him, that this determined his office; as he no longer anſwered the deſcription of the commiſſion; but now it is provided (ſtat. 1 Edw. VI. c. 7.), that, notwithſtanding a new title of dignity, the juſtice on whom it is conferred, ſhall ſtill continue a juſtice. For a further account of the duty of juſtices, ſee Quarter *ſeſſions*.

The original of juſtices of the peace is referred to the fourth year of Edward III. They were firſt called *conſervators*, or *wardens of the peace*, elected by the county, upon a writ directed to the ſheriff; but the power of appointing them was transferred by ſtatutes from the people to the king; and under this appellation appointed by 1 Edw. III. cap. 16. Afterwards the ſtatute of 34 Edw. III. cap. 1. gave them the power of trying felonies, and then they acquired the appellation of juſtices. They are appointed by the king's ſpecial commiſſion under the great ſeal, the form of which was ſettled by all the judges, A.D. 1590; this appoints them all, jointly and ſeverally, to keep the peace, and any two or more of them to inquire and determine felonies, and other miſdemeanors; and the king may appoint as many as he ſhall think fit in every county in England and Wales, though they are generally made at the diſcretion of the lord chancellor, by the king's leave. At firſt the number of juſtices was not above two or three in a county. (18 Edw. III. cap. 2.) Then it was provided by 34 Edw. III. cap. 1. that one lord, and three or four of the moſt worthy men in the county, with ſome learned in the law, ſhould be made juſtices in every county. The number, which gradually increaſed through the ambition of private perſons, was afterwards reſtrained firſt to ſix, and then to eight, in every county, by 12 Ric. II. cap. 10. and 14 Ric. II. cap. 11. But their number has greatly increaſed ſince their firſt inſtitution. As to their qualifications, the ſtatutes juſt cited direct them to be of the beſt reputation and moſt worthy men in the county; and the ſtat. 13 Ric. II. cap. 7. orders them to be of the moſt ſufficient knights, eſquires, and gentlemen of the law; and by 2 Hen. V. ſtat. 1. cap. 4. and ſtat. 2. cap. 1. they muſt be reſident in their ſeveral counties. And by 18 Hen. VI. cap. 11. no juſtice was to be put in commiſſion, if he had not lands to the value of 20*l. per annum.* It is now enacted by 5 Geo. II. cap. 11. that every juſtice, with ſome exceptions, ſhall have 100*l. per annum*, clear of all deductions; of which he muſt make oath by 18 Geo. II. cap. 20. And if he acts without ſuch qualification, he ſhall forfeit 100*l.* It is alſo provided by 5 Geo. II. that no practiſing attorney, ſolicitor, or proctor, ſhall be capable of acting as a juſtice of the peace

Justices *of peace within liberties*, are juſtices of the peace who have the ſame authority in cities, or other corporate towns, as the others have in counties; and their power is the ſame; only that theſe have the aſſiſe of ale and beer, wood and victuals, &c. Juſtices of cities and corporations are not within the qualification act, 5 Geo. II. cap. 18.

Justice-*ſeat.* See Justice *of the Foreſt.*

JUSTICIA, in *Botany*, ſo named by Houſton, in compliment to his countryman James Juſtice, eſq. F. R. S. a clerk of ſeſſion, ſaid by Miller to have been a great lover and encourager of gardening and botany. He publiſhed, in 1764, an 8vo. volume, called the Britiſh Gardener's Director, but, if we are not miſtaken, he derives more honour from this fine and extenſive genus, than he confers upon it.—Linn. Gen. 12. Schreb. 17. Willd. Sp. Pl. v. 1. 79. Mart. Mill. Dict. v. 2. Houſt. Rel. t. 1. Vahl. Enum. v. 1. 108. Ait. Hort. Kew. ed. 2. v. 1. 35. Brown. Prodr. Nov. Holl. v. 1. 475. Juſſ. 104. Lamarck. Illuſtr. t. 12. Gærtn. t. 54. (Adhatoda; Tourn. Inſt. t. 79. Dianthera; Linn. Gen. 13. Schreb. 17. Mart. Mill. Dict. v. 2. Juſſ. 104. Gærtn. t. 51.)—Claſs and order, *Diandria Monogynia.* Nat. Ord. *Perſonatæ*, Linn. *Acanthi*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, in five deep, acute, erect, equal, narrow ſegments. *Cor.* of one petal, ringent; tube ſwelling; limb in two very unequal lips, the upper oblong, notched, the lower in three diviſions. *Stam.* Filaments two, awl-ſhaped, hidden beneath the upper lip; anthers erect, of two cells, which are ſometimes more or leſs diſtant or unequal. *Piſt.* Germen ſuperior, turbinate; ſtyle thread-ſhaped, as long as the ſtamens, and parallel to them; ſtigma ſimple. *Peric.* Capſule oblong, obtuſe, contracted at the baſe, of two cells and two elaſtic valves, the partition contrary to, and fixed in the middle of, each valve. *Seeds* two in each cell, roundiſh, each ſubtended by a ſpinous proceſs.

Eſſ. Ch. Calyx in five deep equal ſegments. Corolla ringent; its lower lip three cleft. Capſule of two elaſtic valves and two cells; partition from the centre of each valve. Seeds two in each cell, ſubtended by ſpines.

The 14th edition of Syſt. Veg. contains but 30 ſpecies of *Juſticia*, and ſeven of *Dianthera*, which latter genus, differing only in having the two lobes of its anthers a little diſtant from each other, is now, by the agreement of all botaniſts, united to the former. Vahl, in his *Enumeratio*, has 148, including Andrews's *lucida*, v. 2. 400, Andr. Repoſ. t. 313, but excluding five ſpecies ſeparated by Vahl as a genus by themſelves, called *Elytraria*. Mr. Brown, who has paid more critical attention to this tribe than any botaniſt with whom we are acquainted, has ſeparated from *Juſticia* his own *Hypoeſtes* (ſee that article); as well as his *Nelſonia*; keeping diſtinct alſo the Linnæan *Eranthemum*, characterized by having a ſalver-ſhaped, nearly equal, corolla, which appears a very ſufficient character. He ſuggeſts that the remaining ſuppoſed *Juſticiæ* ought to be further divided, by modifications of character taken from their anthers, corolla, capſule, and even infloreſcence.

We are well aware that the generic characters above given will not apply throughout to all the plants referred to this genus by Linnæus and his followers, eſpecially what concerns the form or diviſions of the corolla. In ſome indeed the calyx has but four ſegments, inſtead of five, though even that mark, according to Mr. Brown, is not ſtrictly without exception. Willdenow, though he includes *Dianthera*, has but 89 *Juſticiæ*. Thoſe of this author, and of Vahl, which are deſcribed with a double calyx, chiefly belong to *Hypoeſtes*.—*J. pulcherrima*, Linn. Suppl. 84. Vahl. n. 26. Jacq. Ic. Rar. t. 204; with *J. ſcabra*, Vahl. n. 27; and *criſtata*, Jacq. Hort. Schoenbr. v. 3. 38. t. 320, Mr. Brown unites into a new genus, *Aphelandra*, characterized by an unequal calyx, in five deep ſegments, and four ſtamens, bearing anthers of one cell each. Theſe are very handſome ſhrubs, with denſe ſpikes of long ſcarlet flowers; all natives of South America.

Examples of what are at preſent conſidered as *Juſticiæ* are

J. coccinea. Aublet. Guian. v. 1. 10. t. 3. Sm. Ic. Pict. t. 8. Curt. Mag. t. 432.—Spikes terminal. Leaves and bracteas elliptical, acute. Upper lip of the corolla lanceolate, reflexed.—Native of Cayenne. A tall *ſhrub*, which flowers in our ſtoves in winter, but not unleſs it be of a conſiderable ſize. The *leaves* are a ſpan long. *Flowers* of a rich ſcarlet, even more ſplendid than thoſe of the *Aphelandra* juſt named, which at firſt ſight they greatly reſemble. So do alſo thoſe of *J. lucida* above-mentioned. See Curt. Mag. t. 1014.

J. nitida. Jacq. Amer. 5. Vahl. Enum. n. 45. Andr. Repoſ. t. 570.—Cluſters terminal, ſomewhat branched. Flowers whorled. Calyx ſmooth. Leaves ſtalked, lanceolate, ſomewhat elliptical, pointed at each end.—Native of the Weſt Indies. The *leaves* are ſmooth and ſhining. *Flowers* white, the under lip dotted with pink.

J. naſuta. Linn. Sp. Pl. 23. Curt. Mag. t. 325.—Leaves elliptical, entire. Flower-ſtalks axillary, forked. Upper lip of the corolla linear, very narrow.—Found in the Eaſt Indies. It thrives in our ſtoves, flowering almoſt all the year through. The *flowers* are conſpicuous for their whiteneſs, and for the great breadth of the lower lip, whoſe baſe is dotted with crimſon, while the upper is extremely narrow.

J. furcata. Jacq. Hort. Schoenbr. v. 1. 2. t. 3. Vahl. Enum. n. 89. (J. peruviana; Cavan. Ic. v. 1. 17. t. 28. Curt. Mag. t. 430.)—Downy. Axillary flowers ſeſſile and nearly ſolitary; terminal ones ternate. Leaves ovate, or ſomewhat lanceolate.—Native of Peru, from whence it was brought to Spain, and from thence by the marchioneſs of Bute to England. It increaſes plentifully by ſeed in the ſtove, and is a ſhrubby plant, with copious not inelegant purpliſh *flowers*, whoſe palate is ſpeckled with white.

J. Adhatoda. Linn. Sp. Pl. 20. Curt. Mag. t. 861.—Spikes oppoſite, axillary, ſtalked. Bracteas ovate, acute, ribbed. Corolla ſomewhat cloſed.—Native of Ceylon, an old green-houſe plant in Europe, and Tournefort's original ſpecies. It is commonly called the Malabar nut, a name not very appropriate. The ſhrub is handſome and umbrageous, with large ovate *leaves*. The *flowers* are white, their palate veined with purple, which is much concealed by their cloſed or ringent form. They are but rarely produced in England.

J. orchioides. Linn. Suppl. 85. Venten. Malmais. t. 51.—Leaves ſeſſile, lanceolate. Stalks axillary, ſolitary, one or two-flowered. Corolla ſomewhat cloſed.—Native of the Cape of Good Hope. It is kept in the green-houſe at Kew, flowering in autumn. This is a rigid ſhrub, with ſmall crowded, harſh *leaves*. The *flowers*, not very unlike the laſt in form, are white with a reddiſh tinge about the palate, and grow, ſolitary or in pairs, on axillary ſtalks, longer than the leaves.

Justicia, in *Gardening*, comprizes plants of the ſhrubby and herbaceous kinds, of which the ſpecies moſtly cultivated are, chickweed-leaved juſticia (J. ſexangularis); the ſcorpion-tail Vera Cruz juſticia (J. ſcorpioides); the long-ſpiked juſticia (J. ecbolium); the Malabar nut (J. adhatoda); and the ſnap-tree (J. hyſſopifolia).

Method of Culture.—Theſe plants may be increaſed, ſome of them by ſeeds, and the others by layers and cuttings; but the latter modes are moſtly practiſed, as the ſeeds are obtained with difficulty.

Where the ſeeds are capable of being procured, they may be ſown in ſmall pots filled with light freſh earth, in the early ſpring, being plunged in a hot-bed of bark, watering the mould of the pots moderately, when it becomes dry. As they often remain long before the plants appear, the pots ſhould not be diſturbed, but be kept in the hot-bed. When the plants appear, freſh air ſhould be admitted in mild weather, and ſlight waterings given; and when they have attained a few inches in growth, they ſhould be removed into ſeparate pots filled with freſh earth, re-plunging them in the hot-bed, watering and ſhading them till they have taken freſh root; air being then freely admitted, and as the ſeaſon grows warm, due waterings being given. As they advance in growth, they ſhould be placed in larger pots, taking care not to overpot them, keeping them conſtantly in the hot-bed.

The layers ſhould be laid down in the early ſpring, in pots filled with light earth, a little water being given at the time.

The cuttings may be made from the young ſhoots, and planted in pots filled with the ſame ſort of earth, in the later ſpring or ſummer months, giving them a little water, and plunging them in the hot-bed of bark in the ſtove, due ſhade being given.

When the plants have become perfectly rooted, they may be taken off, or removed into ſeparate pots, keeping them conſtantly in the ſtove or green-houſe, according as they are more or leſs hardy. The two firſt ſorts are the moſt hardy; the others ſucceeding beſt in the hot-houſe or ſtove.

The two firſt afford ornament and variety among the other potted plants of the leſs tender ſorts, and the other among thoſe of the ſtove kinds.

JUSTICIAR, in our *Old Laws*, an officer inſtituted by William the Conqueror, as the chief officer of ſtate, and who principally determined all pleas civil and criminal. He was called in Latin *capitalis juſticiarius totius Angliæ.* See Justice.

JUSTICIARII, in *Church Hiſtory*, an appellation given to heretics who boaſt much of perfect righteouſneſs, and deſpiſe others; ſuch were the Phariſees among the Jews, and the Novatians and Donatiſts among the Chriſtians.

JUSTICIARIUS, Magister, a judge in the kingdom of Naples, who has ſupreme juriſdiction in all caſes of treaſon, and pleas of the crown, and finally determines all appeals. He has four aſſeſſors.

JUSTICIARY Court, in Scotland. The court of juſticiary has ſupreme juriſdiction in all criminal cauſes. It came in place of that of *juſtice-eyre*, or *juſtice-general*, which was laſt in the perſon of the earl of Argyle, who tranſacted for it with king Charles I. and was made juſtice-general of all the iſlands; which raiſing great debates between him and ſome hereditary ſheriffs there, the juriſdiction was taken away in 1672, and this court of juſticiary erected inſtead of it, conſiſting of a juſtice-general, alterable at the king's pleaſure; a juſtice-clerk and five other judges, who are likewiſe lords of the ſeſſion.

This court commonly ſits on Mondays, and has an ordinary clerk, who has his commiſſion from the juſtice-clerk. They have four ordinary macers and a doomſter appointed by the lords of ſeſſion.

The form of proceſs is this; the clerk raiſes a libel or indictment, by a bill paſſed by any of the lords of that court, at the inſtance of the purſuer againſt the defender or criminal, who is committed to priſon immediately after citation. When the party, witneſſes, and great aſſiſe, or jury of forty-five men, are cited, the day of appearance being come, fifteen of the great aſſiſe are choſen to be the aſſiſe upon the pannel, or priſoner at the bar. The aſſiſe ſits with the judges to hear the libel read, witneſſes examined, and the debates on both ſides, which is written verbatim in the adjournal books. The king's advocate pleads for the purſuer, being the king's cauſe, and other advocates for the panel. The debates being cloſed, the judges find the libel or indictment either *not relevant;* in which caſe they deſert the diet, and aſſoil or abſolve the party accuſed; or elſe they find the libel *relevant;* in which caſe the aſſiſe or jury of fifteen is removed into a cloſe room, none being allowed to be preſent with them; where they chooſe their own chancellor and clerk, and conſider the libel, depoſitions, and debates, and bring in their verdict of the panel ſealed, guilty or not guilty. If not guilty, the lords abſolve; if guilty they condemn, and order the ſentence of condemnation to be pronounced againſt the criminal by the mouth of the doomſter. It has been ſtrenuouſly maintained by ſome, and as ſtrenuouſly controverted by others, that an appeal lies from this court to the houſe of lords. The lords of juſticiary likewiſe go circuits twice a year, *viz.* in May and October, into the country, which is divided into three circuits, the ſouth-weſt, and north, where aſſiſes are held, and criminals tried, as mentioned above.

JUSTICIES, in *Law*, a writ directed to the ſheriff in ſome ſpecial caſes, by virtue of which he may hold plea of debt in his county-court for a large ſum; whereas otherwiſe, by his ordinary power, he is limited to ſums under forty ſhillings. The freeholders of the county are the real judges in this court, and the ſheriff is the miniſterial officer.

JUSTIFIABLE Homicide. See Homicide.

JUSTIFICATION, in *Law*, a ſpecial plea in bar, which ſignifies a maintaining or ſhewing a ſufficient reaſon in court, why the defendant did what he is called to anſwer. Pleas in juſtification muſt ſet forth ſome ſpecial matter: thus, on being ſued for a treſpaſs, a perſon may juſtify it by proving that the land is his own freehold; that he entered a houſe in order to apprehend a felon; or by virtue of a warrant, to levy a forfeiture, or in order to take a diſtreſs; in an aſſault, that he did it out of neceſſity; and, in an action of ſlander, that the plaintiff is really as bad a man as the defendant ſaid he was.

Justification, or *Juſtifying*, among *Letter Founders*. See *Letter* Foundery.

Among *Printers*, it denotes the proper adjuſtment of the lines and pages.

Justification, in *Theology*, that act of grace which renders a man juſt or righteous in the ſight of God, and places him in a ſtate of ſalvation.

The Romaniſts and reformed are extremely divided about the doctrine of juſtification; the latter contending for juſtification by faith alone, and the former by good works.

In the 11th article of the church of England it is declared that "We are accounted righteous before God, only for the merit of our Lord and Saviour Jeſus Chriſt, by faith, &c." By the faith, which in ſeveral paſſages of ſcripture is ſaid to juſtify and ſave, ſays a commentator on the thirty-nine articles (ſee Elem. of Chriſtian Theology, by the lord biſhop of Lincoln) we are to underſtand that lively "faith which worketh by love;" which purifieth the heart, and which keepeth the commandments of God: But though by theſe acts of obedience we demonſtrate that we truly and firmly believe the divine authority of Chriſt and his doctrines, yet this faith is not ſo meritorious in its own nature as to entitle us to the reward of eternal life: it juſtifies us only by being the condition upon which it has pleaſed our Almighty Father to offer us ſalvation. Our juſtification is not to be attributed to the inherent efficacy of faith, but to the mercy of God, and merits of Chriſt, from which that efficacy is derived. On the contrary, the Papiſts aſſert, that men's inherent righteouſneſs is the meritorious cauſe of their juſtification, and that good works "ad vitam æternam conſequendam veré promereri." (Cave. Trid. de Bon. Op. c. 12.) Some other divines maintain, that as, on the one hand, our ſins were imputed to Chriſt, ſo on the other, we are juſtified by the imputation of Chriſt's righteouſneſs to us; *i. e.* we, though guilty, on complying with the goſpel, are finally treated by God as righteous perſons (*i. e.* as if we had never offended him at all, or had ourſelves ſatisfied the demands of his law for ſuch offences), out of regard to what Chriſt has done or ſuffered, whereas we ſhould not otherwiſe have been ſo treated. Others again, who diſapprove both the term imputation and the ſentiment which it implies, repreſent faith in Chriſt and the goſpel as the principle or ſpring of thoſe virtues or of that character which renders men fit objects of mercy, and of thoſe promiſes of pardon, favour, and eternal life, which flow originally from the grace of God, and which are communicated to mankind by the mediation of Jeſus Chriſt. For the manner in which the doctrines of St. Paul and of St. James, with regard to juſtification, are rendered conſiſtent with each other, ſee the article Faith. Dr. Whitby repreſents faith as conſiſting merely in an aſſent to the goſpel as true; and ſays, that upon declaring that aſſent, a man was juſtified from all paſt ſins, without good works; but that good works were neceſſary in order to *continue* in a juſtified ſtate. A notion much reſembling this has been advanced and largely illuſtrated by Dr. Taylor, in his "Key to the Apoſtolical Writings," prefixed to his Commentary on the epiſtle to the Romans, and included in a "Collection of Tracts," publiſhed by Dr. Watſon, biſhop of Landaff, for the uſe of ſtudents in the univerſities, and the younger clergy. (See Faith.) This learned divine endeavours to eſtabliſh a "double juſtification," or ſalvation, for which, he thinks, we have the cleareſt ſcriptural evidence. The *firſt*, or fundamental juſtification, relates to the heathen ſtate of us gentile Chriſtians, and conſiſts in the remiſſion of ſins, and in our being admitted, upon our faith, into the kingdom and covenant of God; when, with regard to our gentile ſtate, we were obnoxious to wrath, and deſerving of condemnation. This is of "free grace, without works." For how wicked ſoever any Heathen had been, or *now* has been, upon profeſſion of faith in Chriſt, his former wickedneſs neither was, nor is, any bar to his admittance into the kingdom of God, nor to an intereſt in its privileges and bleſſings. Nay further, our preſent common ſalvation, or juſtification, is ſo of grace, and reaches ſo far, that in caſe any profeſſed Chriſtian has lived diſagreeably to the rules of the goſpel; yet, upon his repentance and return to God, his intereſt in the divine grace and the pardon of ſin ſtands good, notwithſtanding his former evil life. This our author calls the "firſt juſtification," or ſalvation, by which we are inveſted in all the preſent privileges of the goſpel; and in reference to which we are ſaid in ſcripture to be *called, elected, ſaved, juſtified, waſhed, ſanctified, born again, born of God,* &c. The firſt juſtification, however, does not terminate in itſelf, but is in order to another, which we may call "*final* juſtification," or ſalvation. This relates to, and ſuppoſes, our Chriſtian ſtate; and conſiſts in our being actually qualified for, and being put in poſſeſſion of, eternal life, after we have duly improved our *firſt* juſtification, or our Chriſtian privileges, by patient continuance in well-doing, to the end, under all trials and temptation. By works, ſays our author, excluded by St. Paul from juſtification or ſalvation, he doth not mean any *ceremonial* works, or *ritual* obſervances of the Moſaic conſtitution (ſee Titus, iii. 5.) ; but all acts of obedience properly *moral*. Moreover, by *works*, or *works of law*, excluded from juſtification, the apoſtle doth not always mean only ſinleſs, perfect obedience. The *works* excluded from juſtification are any kind of obedience, perfect or imperfect, which may be ſuppoſed a reaſon for God's beſtowing the privileges and honours of the goſpel upon the heathen world. Thoſe privileges and honours were beſtowed out of pure mercy and goodneſs, without regard to the foregoing good or bad works of the heathen world. The *works*, which are excluded from juſtification, refer to the prior ſtate of Chriſtians, and to their *firſt* juſtification ; when they were taken into the church or kingdom of God, and had their *paſt ſins* forgiven them. This *firſt* juſtification was not of works, it was of mere grace, according to the counſel and purpoſe of God's own will, without regard to what the Heathen had been before his converſion. But after converſion, when a man is become a Chriſtian, and with regard to *final* juſtification, works are expreſsly required. Nevertheleſs, works of righteouſneſs are ſo inſiſted upon in our Chriſtian ſtate, now that we are taken into the kingdom of God, that if any Chriſtian ſhould neglect the performance of them, there is ſtill room, in *this life*, for repentance. For our Lord and his apoſtles not only called men to repentance, in order to their *firſt* juſtification ; but the apoſtles, and our lord after his aſcenſion, exhort wicked Chriſtians, ſuch as were members of the goſpel church, to repentance, in order to their *final* juſtification. 2 Cor. xii. 21. Rev. ii. 5, 16. iii. 3, 19.

JUSTIFYING Bail, in *Law*. See Bail *above*.

Justifying *Grace*. See Grace.

JUSTIN I., in *Biography*, emperor of the Eaſt, a native of Dacia, was born about the year 450, and was brought up to the mean occupation of keeping of cattle. Poſſeſſing a ſtrength and ſtature which he thought were likely to recommend him, he left the buſineſs of a paſtoral life, and obtained a place among the guards of the emperor Leo. He roſe by degrees in the ſervice, till at length, in 518, he poſſeſſed, at the death of Anaſtaſius, the important office of præfect-prætorio ; and by the application of timely bribes, he ſtepped on to the vacant throne, and apparently with the unanimous conſent of the military, the clergy, and the people. The eunuch Amantius, who would gladly have raiſed one of his own friends to the high office, was, for a real or pretended conſpiracy, with ſome of his aſſociates, puniſhed with exile or death. The Gothic chief Vitalian, who had revolted againſt Anaſtaſius, and remained at the head of a powerful army, was decoyed into the palace, and aſſaſſinated at a royal banquet. Juſtin, to whom the epithet of *elder* is given, to diſtinguiſh him from another emperor of the ſame name and family, was ſixty-eight years of age when he was inveſted with the imperial purple ; and though without any advantages of education, he was preſerved from expoſing his incapacity, by his good ſenſe in following the direction of able ſtateſmen, whom he had the diſcernment to ſelect, and the wiſdom to confide in. At this time, ſays the hiſtorian, the world beheld two contemporary monarchs, Theodoric and himſelf, who were even deſtitute of the knowledge of the alphabet ; but the commanding genius of the Goth rendered him reſpectable amidſt all his ignorance ; and Juſtin, conſcious of his deficiencies, relied on the diligence of his queſtor Proclus, and the talents of his nephew Juſtinian, whom the emperor had brought from the ſolitudes of Dacia, and educated as his future heir. The chief events of this reign were the perſecution of the Arians, advances towards a reconciliation with the Roman ſee, and the commencement of a war with the king of Perſia. He aſſociated Juſtinian as his colleague in the empire in 527, and ſoon after died, in the ninth year of his reign. An earthquake, which almoſt ruined Antioch and ſeveral other cities in the Eaſt, was a calamity which greatly affected the emperor. He is ſaid to have laid aſide the imperial robes, clothed himſelf in ſackcloth, and paſſed ſeveral days in faſting and prayer, to avoid the divine judgments. His piety was not ſurpaſſed by his humanity ; and he diſplayed much benevolence in relieving thoſe who had ſuffered by and ſurvived the terrible diſaſter. Gibbon. Univer. Hiſt.

Justin II., emperor of the Eaſt, nephew and ſucceſſor of Juſtinian, aſcended the throne in 565. The choice of the ſenate and people was ſanctified by the benediction of the patriarch, who placed the diadem on his head, which was the firſt time the ceremony had been performed by a prieſt. As his predeceſſor had given great offence by aboliſhing the office of conſul, the new emperor reſtored it in his own perſon, almoſt as ſoon as he came to the throne. On this occaſion, he diſtributed large ſums of money among the people, and immediately diſcharged the debts, and corrected the abuſes of his late uncle. The popularity acquired by this commencement of Juſtin's reign was ſoon forfeited by inſtances of cruelty and avarice, which were imputed to the inſtigation of the empreſs Sophia. He cauſed his relation Juſtin, who had a military command on the banks of the Danube, to be ſtrangled ; and he put to death ſome of his ſenators, from a ſuſpicion of their being diſaffected. He made war againſt Perſia ; but being defeated at the head of a numerous army, he was obliged to ſue for peace. Soon after this, Juſtin was ſeized with a diſorder, which affected his intellects, and rendered him incapable of government. By the advice of his empreſs, he raiſed to the rank of Cæſar, in the year 574, a Thracian named Tiberius, who had obtained, by his abilities, the office of poſt-captain of the guards. The ceremony of his elevation was performed in the portico of the palace, in the preſence of the patriarch and the ſenate. On this occaſion Juſtin made a long ſpeech, which his flatterers imputed to divine inſpiration, in which he recommended his ſucceſſor to love his people as himſelf ; to cultivate the affections, and maintain the diſcipline of the army ; to protect the fortunes of the rich, and to relieve the neceſſities of the poor : and he concluded with a prayer, that the God of heaven and earth would infuſe into his heart to do whatever he himſelf had neglected or forgotten. The four laſt years of his life were ſpent in retirement ; and his choice was juſtified by the filial reverence and gratitude of Tiberius. Juſtin died October 5th, 578.

Justin, a Latin hiſtorian, is ſuppoſed to have flouriſhed in the ſecond century, under Antoninus Pius. His hiſtory, which is uſed in our ſchools as an elegant compendium for young people, is an abridgment of that of Trogus Pompeius, in forty-four books, which has been long loſt. The narration of Juſtin is clear, his reflections are ſenſible, though obvious, and his ſtyle is ſometimes eloquent. The hiſtory comprehends what relates to the Aſſyrian, Perſian, Grecian, Macedonian, and Roman empires. The beſt editions are thoſe by Gronovius, Hearne, and Barbou. The Delphin edition is much in uſe.

Justin, *St.*, in *Geography*, a town of France, in the department of the Landes ; 27 miles W. of Condom.

JUSTINGEN, a town and capital of a lordſhip, purchaſed in 1751 by the duke of Wirtemberg ; 16 miles N.N.E. of Buchau.

JUSTINIAN I., in *Biography*, emperor of the Eaſt, was born of an obſcure race in Dacia, whence, as we have ſeen in the article JUSTIN I., he was brought, and educated with a view of ſucceeding to the empire. Juſtinian was, during the life of his uncle, made partner in the imperial throne; and upon the death of Juſtin, became its ſole poſſeſſor, being at that period, A.D. 527, in the forty-fifth year of his age. Immediately upon his elevation, he ſolemnly eſpouſed Theodora, an actreſs, who in early youth had followed a courſe of proſtitution, and who gained ſo complete an aſcendancy over the mind of the emperor, as to be aſſociated with him on the throne. He began his reign by a violent perſecution of heretics and ſectaries, and he regarded himſelf as a great theologian. His reign was, however, memorable for many important tranſactions, military and civil; and he carried his arms with ſucceſs againſt his enemies, for which he was chiefly indebted to Beliſarius his great general, who alſo preſerved him from a formidable conſpiracy. (See the article BELISARIUS.) The legiſlative labours of Juſtinian are what have conferred the chief celebrity on his name. The reformation of the Roman juriſprudence occupied the attention of the emperor from his firſt poſſeſſion of the ſupreme power. The perſon to whom he principally confided this arduous taſk was Tribonian, an eminent lawyer of various and extenſive attainments. By his cares, and thoſe of nine perſons aſſociated with him, the new code of Juſtinian was completed in the year 529. This publication was followed in 533 by that of the Pandects or Digeſt, a compilation of the deciſions and opinions of former civilians; and of the Inſtitutes, an elementary treatiſe of the Roman law for the uſe of ſtudents. A new edition of the Code, in 534, made a conſiderable addition to the emperor's own laws; and his Edicts and Novels complete the vaſt edifice of juriſprudence, reared by the legiſlative ſpirit which diſtinguiſhed his reign. Another remarkable trait in this emperor's character was his paſſion for building. His piety was diſplayed in numerous churches, and other buildings dedicated to religion, of which the celebrated church of Sancta Sophia at Conſtantinople, now ſubſiſting as the principal moſque of the Turkiſh empire, atteſts the magnificence of his deſigns. Bridges, aqueducts, high-roads, and hoſpitals, were among his works of public utility, by which every province of the empire was benefited. His works of peace were frequently interrupted by wars, which agitated the empire during almoſt the whole of this reign; but in 558, a peace upon honourable terms put an end to the long conteſts between the Roman and Perſian empires. The rejoicings on this event were diſturbed by a dreadful earthquake, which overthrew many ſtately edifices, with a great loſs of lives. Juſtinian, broken down with cares and old age, died in November 565, in the thirty-ninth year of his reign, and the eighty-third of his age. Among other diſtinguiſhed events of this reign, the introduction of the ſilk-worm into the Greek empire, by means of two Perſian monks, who went as miſſionaries to China, ought not to be omitted. The increaſing jealouſies, and the heavy burdens which Juſtinian impoſed upon his ſubjects, had, ſome time before his death, deſtroyed all attachment to his perſon; and he who, in many reſpects, deſerved the title of the laſt Roman emperor, left the ſtage unlamented and unhonoured. Gibbon. Univer. Hiſt.

JUSTINIAN II., emperor of the Eaſt, ſucceeded his father Conſtantine Pogonatus in 685, being then only ſixteen years of age. He was naturally of a violent temper; and his love of war induced him to break a treaty which he had made with the Saracens, and renew hoſtilities againſt them. He recovered ſeveral provinces from his enemies, and made an extravagant peace with them; but his exactions, cruelties, and debaucheries, tarniſhed the glory of his arms, and rendered him an object of hatred to all. He formed a deſign of deſtroying all the inhabitants of Conſtantinople: but Leontius, a celebrated commander, attempted the deliverance of his country. He was ſucceſsful; dethroned the emperor, and ſeized him and his miniſters without reſiſtance. Juſtinian's life was ſpared, but he was ſentenced to be baniſhed, and to ſuffer the amputation of his noſe: hence he was named by the Greeks "Rhinotmetus." In 704 he, by the aſſiſtance of the Bulgarians, regained his ſeat, when he revenged himſelf upon his enemies. The firſt victims were Leontius and Tiberius, who had ſucceſſively filled the throne during the interval of his baniſhment. Theſe were dragged in triumph through the city, and then placed in chains beneath his throne, whence he beheld the ſpectacles, with a foot upon each of their necks, whilſt the inconſtant people ſhouted, "Thou ſhalt trample on the aſp and baſiliſk." They were then led to execution. So many perſons were, on this occaſion, the victims of his fury, that it is ſaid whole provinces were almoſt depopulated by the multitude of his executions. Juſtinian died by the hands of aſſaſſins in 711; and ſuch was the hatred which he had every where inſpired, that his young ſon Tiberius, whom his grandmother had placed in a ſanctuary, was dragged from the altar, and murdered before her eyes. Thus the race of Heraclius was extinguiſhed, after a reign of one hundred years. Univer. Hiſt. Gibbon.

JUSTIZA, a magiſtrate of Arragon, whoſe office bore ſome reſemblance to that of the ephori in ancient Sparta. He acted as the guardian of the people, and the comptroller of the prince. His perſon was ſacred, and his juriſdiction unbounded. He was the ſupreme interpreter of the laws. Not only inferior judges, but the kings themſelves, were bound to conſult him in every doubtful caſe, and to receive his reſponſes with implicit deference. An appeal lay to him from the royal judges, as well as from thoſe appointed by the barons within their reſpective territories. Even when no appeal was made to him, he could interpoſe by his own authority, prohibit the ordinary judge to proceed, take immediate cognizance of the cauſe himſelf, and remove the party accuſed to the "Manifeſtation," or priſon of the ſtate, to which no perſon had acceſs but by his permiſſion. His power was exerted with no leſs vigour and effect in ſuperintending the adminiſtration of government, than in regulating the courſe of juſtice. It was his prerogative to inſpect the conduct of the king, to review all the royal proclamations and patents, and to declare whether or not they were agreeable to the law, and fit to be executed. He, by his ſole authority, could exclude any of the king's miniſters from the conduct of affairs, and call them to anſwer for their mal-adminiſtration. The juſtiza himſelf was accountable only to the Cortes for the execution of his high office. By a law enacted in the Cortes, A.D. 1442, it was ordained that the juſtiza ſhould continue in office during life, and ſhould not be removed from it, unleſs by the authority of the Cortes. This officer was appointed by the king; but to prevent his becoming a dependent and tool of the crown, inſtead of the guardian of the people, it was determined that he ſhould retain his office during life. He was ſelected from perſons of the ſecond claſs, or cavalleros, anſwering nearly to gentlemen or commoners in Great Britain, and not from the ricoſhombres or noblemen, that he might check the domineering and oppreſſive ſpirit of the nobles, as well as ſet bounds to the power of the monarch; and that he himſelf might be accountable for the manner in which he executed his truſt, and liable to rigorous puniſhment: whereas the ricoſhombres were not ſubject to capital puniſhment. For contracting his power, ſeventeen perſons were choſen by lot in each meeting of the Cortes; and theſe formed a tribunal, called the court of inquiſition into the office of juſtiza. This court met at three ſtated times in the year; and to this court the juſtiza and his deputies were reſponſible for their conduct. The members of the court paſſed ſentence by ballot; and they might puniſh by degradation, confiſcation of goods, or even with death. The law which erected this court, and regulated the forms of its precedence, was enacted A.D. 1461. Robertſon's Hiſt. of Charles V., vol. i.

JUSTNESS, the exactneſs or regularity of any thing.

Juſtneſs is chiefly uſed in ſpeaking of thought, language, and ſentiments. The juſtneſs of a thought conſiſts in a certain preciſion or accuracy, by which every part of it is perfectly true, and pertinent to the ſubject.

Juſtneſs of language conſiſts in uſing proper and well choſen terms; in not ſaying either too much, or too little.

M. De Mere, who has written on juſtneſs of mind, diſtinguiſhes two kinds of juſtneſs; the one ariſing from taſte and genius; the other from good ſenſe, or right reaſon. There are no certain rules to be laid down for the former, *viz.* to ſhew the beauty and exactneſs in the turn, or choice of a thought; the latter conſiſts in the juſt relation which things have to one another.

JUTE, in *Manufactures*, is a remarkably ſtrong vegetable fibre, the produce of the Eaſt Indies, which Dr. William Roxburgh has fully deſcribed, and its uſes, in the Tranſactions of the Society of Arts, vol. xxii. p. 372.

JUTERBOCK, in *Geography*, a town of Germany, in the principality of Querfurt, with two fauxbourgs, ſituated on the Angerbach; 16 miles N. E. of Wittenburg. N. lat. 52°. E. long. 13° 2′.

JUTES, in *Ancient Hiſtory*, a tribe of the Getæ, the conquerors of ſo many countries, inhabited the extremity of the Cimbric Cherſoneſus, which from them is ſtill called *Jutland;* which ſee.

JUTHIA, Odia, or *Siam*, in *Geography*, a town of Aſia, capital of the kingdom of Siam, and reſidence of the king, ſituated on a large iſland in the river Menan, at the diſtance of ſome leagues from the ſea. The royal palace is large and beautiful, and the pagodas are numerous. The Dutch have a factory here, and many merchants from different countries come to trade. In 1766, this town was taken by the Birmans. N. lat. 14° 18′. E. long. 100° 52′.

JUTLAND, a peninſula of Europe, in the kingdom of Denmark, formerly called "Cimbria," and the "Cherſoneſus Cimbricus," bounded on the E. by the Scaggerak, the Little Belt, and the Baltic; on the S. by the duchy of Holſtein, and on the W. and N. by the Northern ſea; about 200 miles long, and 95 broad. It is generally divided into North Jutland, more eſpecially called Jutland, and South Jutland, more generally called the "duchy of Sleſwick;" which ſee.

Jutland, or *North Jutland*, is bounded on all ſides by the ſea, except towards the ſouth, where its boundary is the duchy of Sleſwick; it is about 150 miles long, and from 60 to 80 broad. Of all the territories belonging to Denmark, it is the largeſt and yields the greateſt revenue. The middle part conſiſts of heaths and moors, intermixed with few ſpots of arable land; but theſe afford good paſture for oxen, ſheep, and goats. The other parts, of greater extent, are very fertile, and yield a great quantity of grain, which is annually exported to Sweden, Norway, and Holland. The inhabitants derive alſo conſiderable ſums from their oxen, horſes, and hogs. Hence Jutland is commonly called "the land of bacon and rye bread." This country is alſo plentifully ſupplied with all kinds of freſh water and ſea fiſh. On the eaſt ſide it has fine woods of oak, beech, fir, &c. but on the weſt ſide the inhabitants are obliged to uſe heath and turf for fuel. Jutland abounds with game. The air is keen and cold, eſpecially towards the North ſea. The inhabitants are vigorous, robuſt, and reſolute; and ſeem to have gained a greater degree of freedom than the other inhabitants of Denmark. Many of the Jutlanders have freeholds, for which they pay a ſmall acknowledgment to the lord of the manor and the public taxes. The Daniſh language is ſpoken in Jutland with a particular accent, and with leſs purity than in the other provinces. The only place in which the exerciſe of any religion, beſides Lutheraniſm, is tolerated, is Fredericia. North Jutland is compoſed of four dioceſes, or governments; each of which has its biſhop and general-governor; and they derive their names from thoſe of their chief cities, *viz.* Aalborg, Wiborg, Arrhuus, and Ripen. The population of theſe four dioceſes is ſtated by Mr. Coxe at 358,136 perſons. Jutland ſupplies tripoly and fuller's earth, beſides ſome alum and vitriol.

JUTRAM, a town of Hindooſtan, in Guzerat, on the gulf of Cambay; 16 miles N.W. of Amood.

JUTTARA, a town of Hindooſtan, in the circar of Cicacole; 10 miles N. of Viſigapatam.

JUTTY Head. See Jetty *Head.*

JUTWAR, in *Geography*, a ſmall circar of Hindooſtan, in Guzerat, on the left bank of the Puddar, a little above the gulf of Cutch; about 25 miles long, and 16 broad.

JUVANTIA, in *Medicine*, literally ſignifying *aiding* things, and generally contraſted with *lædentia*, or *hurtful* things, is a term applicable to every agent or circumſtance which contributes to alleviate a diſeaſe, as the word *lædentia* ſignifies every thing which can increaſe the ſymptoms of a diſorder, or prevent its progreſs towards amendment; but the terms are principally uſed to denote thoſe things, which poſſeſs a minor degree of influence on the animal economy, and cannot be claſſed among the actual remedies or cauſes of diſeaſe. Whence the common precept of medical writers, to attend to the *juvantia* and *lædentia*, at the ſame time that the active remedies for any diſeaſe are employed.

JUVELSKOI, in *Geography*, a town of Ruſſia, in the government of Tobolſk. N. lat. 63° 40′. E. long. 61° 14′.

JUVENAL, Decius Junius Juvenalis, in *Biography*, a celebrated Roman poet, who was born at Aquinum, in Italy. He came early to Rome, and paſſed much of his life in the purſuits of the bar, after which he applied himſelf to write ſatires, ſixteen of which are ſtill extant, and very highly prized. They ſtand pre-eminent in the claſs of thoſe which employ warm ſerious invective, and make vice rather than folly their object. He wrote with acrimony againſt all his adverſaries: he is far more correct than his contemporaries, which has been attributed to his judgment and experience, being far advanced in life when he wrote his ſatires. He appears to have been a lover of virtue, though his language and deſcriptions are ſometimes very groſs: many of his maxims of morality are delivered with great force and dignity; as a poet he has more animation than taſte. He has with reaſon been called the laſt of the Roman poets, for after him poetry decayed, and nothing more claims attention as a perfect poetical compoſition. The beſt editions of this poet are thoſe by Caſaubon, of Hawkey, and of Grævius cum notis variorum. The Delphin edition is much uſed, as are the Aldine and Glaſgow editions.

JUVENALIA, or Juvenales *ludi*, games, exerciſes of body, and combats, inſtituted by Nero the firſt time his beard was ſhaved.

They were celebrated in private houſes, and even the women had a ſhare in them: probably they were the ſame with what were otherwiſe called *Neroniana*.

JUVENCUS, Caius Vettius Aquilinus, in *Biography*, one of the earlieſt Chriſtian poets, was a prieſt of a noble family in Spain, and flouriſhed in the fourth century. He wrote a poem on the life of Chriſt, taken from the goſpel of St. Matthew. It was compoſed about the year 329. It has been frequently reprinted, and may be found in Mattaire's "Corpus Poetarum;" and in the "Bibliotheque des Pères." Gen. Biog.

JUVENIEC, in *Geography*, a town of Poland, in the palatinate of Wilna; 70 miles E. of Lida.

JUVENTAS, in *Mythology*, the goddeſs who preſided over youth among the Romans. This goddeſs was long honoured in the Capitol, where Servius Tullius erected her ſtatue. Near the chapel of Minerva there was the altar of Juventas, and upon this altar a picture of Proſerpine. The Greeks called the goddeſs of youth Hebe; but it has been generally ſuppoſed that this was not the ſame with the Roman Juventas.

JUVIGNY, in *Geography*, a town of France, in the department of the Channel, and chief place of a canton, in the diſtrict of Mortain; four miles N. W. of Mortain. The place contains 632, and the canton 5603 inhabitants, on a territory of 100 kiliometres, in nine communes. Alſo, a town of France, in the department of the Marne; nine miles N.W. of Chalons-ſur-Maone.—Alſo, a town of France, in the department of the Orne, and chief place of a canton, in the diſtrict of Domfront. The place contains 1945, and the canton 11,126 inhabitants, on a territory of 207½ kiliometres, in 13 communes.

IVY, in *Botany*, &c. (See HEDERA.) The ivy is a ſmall well-known creeping or climbing kind of plant. From its property of ſpreading rapidly over a ſurface, it has been recommended as proper for protecting the faces of earthen dikes, and other ſimilar fences, as by this means they are preſerved from mouldering down and being deſtroyed.

Ivy, in the *Materia Medica*. The leaves of ivy are ſeldom uſed inwardly, but outwardly they are applied to iſſues, to keep them cool, and free from inflammation, as alſo to ſcabs, ſores, and ſcald heads. Mr. Boyle, in his uſe of Experimental Philoſophy, commends a large doſe of the full ripe berries as a remedy againſt the plague; and it is ſaid, that in the London plague, the powder of them was given in vinegar, or white wine, with ſucceſs; and they have been recommended in ſmall doſes, as alexipharmic and ſudorific. Schroder ſays, they purge upward and downward. The gum of ivy is ſomewhat cauſtic, and commended to take away ſpots and freckles out of the face. This reſinous juice, exuding from the ſtalks of ivy, has been recommended as corroborant and reſolvent, in cachexies and uterine obſtructions; but has been rarely uſed, except as an ingredient in plaſters; nor does it appear to poſſeſs any virtues which common reſin has not in an equal degree.

Ivy-*reſin* is brought from Perſia, and ſome other of the hot countries, where alone it is to be found in any conſiderable quantity. Mr. Ray, indeed, mentions ſome of it having been found on ivies in Worceſterſhire, and other authors in other parts of Europe; but theſe are only ſingular inſtances of what may happen, our ſhops being obliged to be ſupplied from the Eaſt.

The ancient Greeks were acquainted with this reſin, which they called *lachryma hederæ*, as ſome alſo do to this day. It is ſaid to be emollient and detergent, and to make a noble balſam for freſh wounds; but is never uſed by us with theſe intentions. The Perſians eſteem it much as an aſtringent.

Ivy, *Ground*, in *Botany* and the *Materia Medica*. See GLECHOMA.

Ivy-*tree of America*. See KALMIA.

Ivy, *Petrified*. See PETRIFACTION.

Ivy, *Virginian*. See MOONSEED.

JUXON, William, in *Biography*, was born at Chicheſter, but received his education at Merchant Taylors' ſchool, London, from whence he was removed to St. John's college, Oxford, of which he was made a fellow in 1598, and in 1621, he was elected preſident. In 1627, he was promoted to the deanery of Worceſter, and in 1633, appointed clerk of the cloſet to the king, and in the following year he obtained, through the intereſt of archbiſhop Laud, the biſhopric of London; and ſhortly after he was appointed lord high treaſurer. This laſt promotion gave general offence. His birth and character were deemed too obſcure for a man raiſed to one of the higheſt offices of the crown; nevertheleſs, his conduct in that ſtation was irreproachable. In the rebellion he ſuffered the loſs, not only of his eccleſiaſtical revenues, but of a great part of his temporal eſtate. In 1648, he attended the king upon the ſcaffold, after which he was taken into cuſtody with a view of forcing him to reveal any ſecrets with which his majeſty had entruſted him; but his prudence, integrity, and honour, were ſuperior to every art exerciſed upon him. At the reſtoration he was made archbiſhop of Canterbury. He died in 1663, at the age of 81, and was buried in St. John's college-chapel, Oxford. He was a perſon of great integrity, mildneſs, and humanity, and endowed with an excellent underſtanding. Wood. Hume.

JUXTAPOSITION, is uſed by philoſophers to denote that ſpecies of growth, which is performed by the appoſition of new matter to the ſurface, or outſide, of old.

In which ſenſe, it ſtands oppoſed to intuſ-ſuſception; where the growth of a body is performed by the reception of a juice within it, diffuſed through its canals. See NUTRITION.

JUZCUR, in *Geography*, a town of Africa, in the kingdom of Fez, on the coaſt of the Mediterranean; 15 miles W. of Mezemba.

JUZENNECOURT, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Chaumont; ſix miles N.W. of Chaumont The place contains 243, and the canton 6435 inhabitants, on a territory of 272½ kiliometres, in 24 communes.

IWAMI, or SEKISJU, a province of Japan.

IWANCZOWICZA, a town of Lithuania, in the palatinate of Novogrodek; 52 miles S.S.W. of Novogrodek.

IWANGROD, a town of Poland, in the palatinate of Braclaw; 60 miles E.S.E of Braclaw.

IWATA, a town of Japan, in the iſland of Niphon: 100 miles W. of Jedo.

IWETPOUR, a town of Bengal; 15 miles E. of Geragot

IWIE, a town of Lithuania, in the palatinate of Wilna; 24 miles E. of Lida.

IWNICA, a town of Poland, in the palatinate of Kiev; 60 miles W S W of Kiev.

IXIA, in *Botany*, ἰξία, the Greek name of the Miſſeltoe, or *Viſcum album*. It does not appear why Linnæus adopted it for the preſent genus.—Linn. Gen. 26. Schreb. 35. Willd. Sp. Pl. v. 1. 195. Vahl. Enum. v. 2. 40. Thunb. Diſſ. n. 8. Ait. Hort. Kew. ed. 2. v. 1. 86. Ker. in Ann of Bot. v. 1. 226. Curt. Mag. p. 1013. Mart. Mill. Dict.

v. 2.

t. 2. Juſſ. 58. Lamarck. Illuſtr. t. 31.—Claſs and order, *Triandria Monogynia.* Nat. Ord. *Enſatæ,* Linn. *Irides,* Juſſ.

Gen. Ch. *Cal.* Spatha inferior, ſhorter than the corolla, of two oblong permanent valves; the outermoſt enfolding the inner one. *Cor.* of one petal, ſuperior; tube thread-ſhaped, ſlender, erect, ſcarcely dilated upwards; limb regular, divided to its very baſe into ſix, nearly equal, ſpreading, flattiſh ſegments. *Stam.* Filaments three, inſerted into the mouth of the tube, decurrent, much ſhorter than the limb; anthers oblong, ſomewhat curved. *Piſt.* Germen roundiſh, ſomewhat triangular; ſtyle thread-ſhaped, erect; ſtigmas three, linear, recurved, ſpreading. *Peric.* Capſule roundiſh-ovate, membranous, tumid, of three cells and three valves. *Seeds* numerous, globoſe.

Eſſ. Ch. Spatha of two valves. Corolla with a ſlender tube, and regular limb. Stigmas three, narrow, recurved. Capſule ovate, ſomewhat globoſe. Seeds globoſe.

An extenſive genus of bulbous Cape plants in Linnæus, Willdenow, and Vahl, from which Mr. Ker has, generally we think very happily, ſeparated ſeveral genera, all agreeing with it in the regular corolla, by which they are all in common diſtinguiſhed from *Gladiolus* (ſee that article); but differing from it, as well as among themſelves, in other particulars. See ARISTEA, GEISSORRHIZA, and HESPERANTHA.—As we have given a view of all the certain ſpecies of *Gladiolus,* we deem it neceſſary to do the ſame by *Ixia,* of which Mr. Ker reckons up 15 ſpecies. In its old ſtate the genus ſtands in Willdenow with 47 ſpecies, and in Vahl with 56, beſides ſix reckoned by the latter doubtful, adopted from Burmann.

Section 1. *Limb leſs ſpreading, tube ſhorter, ſpatha larger, as well as more thin and membranous, than in the reſt.*

1. I. *pendula.* Thunb. Diſſ. n. 16. Linn. Suppl. 91.—Flowers ſomewhat bell-ſhaped, pendulous. Branches of the panicle capillary, drooping. Spatha longer than the tube.—Gathered at the Cape of Good Hope, in watery places, in November, by Thunberg, who deſcribes it as the talleſt and moſt ornamental of its genus, with large, pendulous, fleſh-coloured *flowers,* the ſegments of which, in his ſpecimen given to Linnæus, are above an inch long, while the tube is not half ſo much. We know no figure of this ſpecies, nor is it in the gardens.

2. I. *capillaris.* Thunb. n. 12. t. 2. f. 2. Linn. Suppl. 92. Ker in Curt. Mag. t. 570? Flowers ſomewhat bell-ſhaped. Spatha equal to the tube. Leaves linear.—Native, like all the reſt, of the Cape of Good Hope, flowering in our green-houſes chiefly in the ſpring. Mr. Ker quotes under this *I. lancea,* Jacq. Ic. Rar. t. 281. If this be right, it varies in the breadth of its *leaves,* as well as in having ſometimes only one flower on a ſtalk, ſometimes ſeveral. They are of a pale roſe or fleſh colour. The *bulb* is curiouſly reticulated.

3. I. *aulica.* Ait. Hort. Kew. ed. 1. v. 1. 57. ed. 2. v. 1. 86. (I. capillaris γ; Ker in Curt. Mag. t. 1013.)—Flowers nearly ſalver-ſhaped, crowded. Spatha half as long as the tube. Leaves oblong, many-ribbed.—Sent by Mr Maſſon to Kew garden in 1774. Mr. Ker eſteems it a variety of the preceding, but the characters we have given ſeem to diſtinguiſh it. The *flowers* are much more expanded, and larger, of a full roſe-colour, and the *leaves* very much broader.

Section 2. *Tube ſlender, conſiderably longer than the ſpatha; limb widely ſpreading.*

4. I. *ariſtata.* Thunb. Diſſ. n. 15. Ker in Curt. Mag. t. 589.—Spike ſomewhat level-topped. Spatha about one-fourth the length of the tube, ſharply toothed. Limb ſalver-ſhaped. Stamens nearly equal to the ſtyle.—The *leaves* are broad and ſword-ſhaped, with many ribs, and a cartilaginous though narrow edge. *Stem* round, ſometimes branched. *Flowers* numerous, ſomewhat corymboſe, roſe-coloured with a white orifice, inodorous, their limb quite flat. The *ſpatha* has much of the character of Mr. Ker's genus *Sparaxis.* This ſpecies requires a conſtant ſupply of water, eſpecially when about flowering.

5. I. *patens.* Ait. Hort. Kew. ed. 1. v. 1. 59. ed. 2. v. 1. 86. Ker in Curt. Mag. t. 522. Redout. Liliac. t. 140. (I. filiformis; Venten. Jard. de Cels, t. 48. Redout. Liliac. t. 30. I. ariſtata; Schneev. Ic. t. 32.)—Spike cylindrical. Tube very ſlender; limb widely ſpreading, ſomewhat reflexed. Filaments erect and cloſe together.—The *leaves* of this very handſome ſpecies are ſword-ſhaped. *Stem* ſlender, erect and rigid. *Flowers* more or leſs numerous, in a cylindrical ſpike, rarely branched, their colour a vivid crimſon or carmine, ſometimes varying to a lighter vermilion hue. The ſegments of the limb are often much reflexed, and they vary in length, but are uſually elliptical, and each near an inch long. The eye, or orifice of the tube, is often green bordered with white.

6. I. *flexuoſa.* Linn. Sp. Pl. 51. Ker in Curt. Mag. t. 624. (I. polyſtachya; Redout. Liliac. t. 126. I. capitata, var. ſtellata; Andr. Repoſ. t. 232.)—β. I. flexuoſa; Curt. Mag. t. 127.—Stem branched, racemoſe. Tube ſlender, ſlightly dilated upward; limb ſomewhat contracted, its ſegments elliptical, concave, ſpreading. Filaments cloſe together.—The *leaves* are linear, graſſy. *Stem* ſlender, not quite erect, branched for the moſt part, each branch bearing a ſhortiſh cluſter of pale roſe-coloured, moſtly ſtriped, fragrant *flowers,* half the ſize of the laſt, their orifice moſtly yellow, their ſegments not expanded into a ſalver-ſhape, each of them moreover being concave. Sometimes the flowers are of a pale or dull violet-colour.

7. I. *conica.* Saliſ. Hort. 36. Ker in Curt. Mag. t. 539. Redout. Liliac. t. 138. (I. capitata, var. fl. aurantio; Andr. Repoſ. t. 50. I. fuſco-citrina; Redout. Liliac. t. 86.)—Stem ſimple. Cluſter denſe. Limb ſpreading, twice as long as the tube. Style longer than the filaments.—The *leaves* are linear and graſſy. *Flowers* in a *thyrſus,* or denſe cluſter, as large as thoſe of I. *patens,* but leſs expanded, of a rich orange, ſometimes a lemon-colour, with a brown and yellow eye, inodorous. The *ſtyle* continues undivided above the baſe of the *anthers.*—This is one of the moſt ſplendid of the genus.

8. I. *monadelpha.* Ait. Hort. Kew. ed. 2. v. 1. 87. Ker in Curt. Mag. t. 607. (I. columnaris; Andr. Repoſ. t. 203. 211. 213. 250. Galaxiæ ixiæflora; Redout. Liliac. t. 41.)—Cluſter corymboſe. Flowers ſalver-ſhaped. Filaments united into a tube. Remarkable for its perfectly monadelphous *ſtamens.* The *leaves* are ſword-ſhaped. *Flowers* ſcentleſs, rather large, not numerous, in a ſhort corymboſe cluſter; their tube about equal in length to the limb, which is flat, uſually light blue or purple, rarely yellow, always diſtinguiſhed by a broad browniſh, or greeniſh, central ſtain, or eye.

9. I. *columellaris.* Ait. Hort. Kew. ed. 2. v. 1. 88. Ker in Curt. Mag. t. 650. (I. columnaris, var. anguſtifolia; Andr. Repoſ. t. 392.) Cluſter corymboſe. Flowers nearly ſalver-ſhaped. Filaments united at their baſe.—Differs from the laſt in the *ſtamens* being united at their baſe only, the *flowers* ſcented like woodruff or new hay, not quite ſo horizontally expanded, opening in the morning and cloſing at noon, and produced in Auguſt inſtead of the ſpring. Their colour is purpliſh, the eye richly variegated with broad circles of black and red. The *leaves* are graſſy.

10. I. *maculata.* Thunb. Diſſ. n. 19. Linn. Syſt. Veg. ed. 14. 85. Mant. 320. Ker in Curt. Mag. t. 549. 789. 1285. Andr. Repoſ. t. 196. 256. Redout. Liliac. t. 137. Jacq. Hort. Schoenbr. v. 1. 9. t. 19—23. Schneev. Ic. t. 6. 25. (I. capitata; Andr. Repoſ. t. 23. 159. I. ſpicata, var. viridi-nigra; Andr. Repoſ. t. 29.)—Flowers nearly ſalver-ſhaped; tube capillary; limb ſtained at the baſe. Stigmas ſeparate as low as the tube. This common and ornamental ſpecies, figures of which are needleſsly multiplied by authors, is known by the broad dark ſtain in the centre of the *flower*, while it differs from the two laſt in having diſtinct filaments. The colour of the *corolla* ſports in every ſhade of crimſon, pale purple, orange, yellow, even to white; though, as Mr. Ker obſerves, ſome other ſpecies may poſſibly be confounded under Jacquin's numerous varieties. The moſt remarkable variety is the green, in t. 23. of that author, Curt. Mag. t. 549, Andr. t. 29, Schneev. t. 6. The *leaves* are linear-ſword-ſhaped. *Spike* or *cluſter* oblong, various in length, ſimple and almoſt always ſolitary. *Flowers* about as large as thoſe of our 5th and 7th ſpecies, their tube very ſlender, ſhorter than the limb, which is a little concave. *Style* encloſed in the tube; ſtigmas projecting.

11. I. *erecta.* Thunb. Diſſ. n. 18. Ker in Curt. Mag. t. 623. 1173. Jacq. Hort. Schoenbr. v. 1. 9. t. 18. (I. polyſtachia; Linn. Sp. Pl. 51. Andr. Repoſ. t. 155. I. dubia; Redout. Liliac. t. 64. Venten. Choix. t. 10.)—Corolla widely ſpreading; tube capillary; limb pale at the baſe. Stigmas ſeparate as low as the tube.—The *ſtem* ſometimes bears many ſpikes. The *flowers* are ſmaller than in the laſt, white or yellow, without any broad dark ſtain. They come late in the ſummer, and are inodorous. It is very difficult to find a good ſpecific character between plants ſo variable, and yet ſo much alike.

Section 3. *Style extended above the anthers. Bulb ſomewhat tuberous and deformed.*

12. I. *crateroides.* Ker in Curt. Mag. t. 594. Ait. Hort. Kew. ed. 2. v. 1. 89. (I. ſpecioſa; Andr. Repoſ. t. 186.)—Corymb of two or three flowers. Limb of the corolla hemiſpherical; tube very ſhort. Style longer than the ſtamens.—Found at the Cape by Mr. Nevin. The *flowers* rarely ſo many as three on a ſtem, are large, concave, of a rich crimſon within, paler externally. Their ſtyle is ſo long as to extend nearly to the end of the anthers before the ſtigmas branch off.

Section 4. *Anthers ſhort. Stigmas cloven.*

13. I. *retuſa.* Saliſ. Hort. 35. Ait. Hort. Kew. ed. 2. v. 1. 89. (I. polyſtachya; Jacq. Ic. Rar. t. 275. Ker in Curt. Mag. t. 629. Andr. Repoſ. t. 128.)—Tube of the flower twice as long as the ſpatha; ſegments of the limb elliptic-oblong. Stigmas cloven and gaping.—This, being often branched, has been taken for the *polyſtachia* of Linnæus, a name now laid aſide, as cauſing only confuſion. That we have retained is indeed not unexceptionable, the ſegments of the corolla not being always abrupt. It is a tall ſlender ſpecies. *Flowers* ſmall, roſe-coloured, ſmelling like lily of the valley.

14. I. *ſcillaris.* Linn. Sp. Pl. 52. Ker in Curt. Mag. t. 542. Redout. Liliac. t. 127. (I. pentandra; Linn. Suppl. 92. Thunb. Diſſ. n. 22. I. reflexa; Andr. Repoſ. t. 14.)—Spatha as long as the tube. Segments of the limb ſpatulate, concave. Stigmas funnel ſhaped. Anthers deflexed.—That this is the real I. *ſcillaris* of Linnæus, not unaptly compared by him to *Scilla amoena*, appears from his herbarium; though Thunberg induced Linnæus the younger to call it *pentandra*, becauſe the ſtamens are ſometimes four or five, and led him to adopt his own *ſcillaris*, Diſſ. n. 14.—It differs from *retuſa* in the above characters, and has no ſcent. The *leaves* are broad, with many ribs. *Flowers* roſe-coloured, in a long ſpike.

15. I. *criſpa.* Linn. Suppl. 91. Thunb. Diſſ. n. 8. t. 2. f. 3. Ker in Curt. Mag. t. 599.—Leaves ſtrongly undulated. Stigmas funnel-ſhaped, deflexed.—A beautiful little ſpecies, on account of its curiouſly waved and criſped *leaves*. The *flowers* are roſe-coloured, inodorous; their ſegments obovate and concave.—Thunberg ſays they vary at the Cape to blue or white.

Ixia, in *Gardening*, contains plants of the herbaceous, bulbous, and tuberous-rooted perennial kinds; of which the ſpecies principally cultivated are, the crocus-leaved ixia (I. bulbocodium); the Chineſe ixia (I. chinenſis); the roſe-coloured ixia (I. roſea); the bulb-bearing ixia (I. bulbifera); the bearded ixia (I. ariſtata); the bending-ſtalked ixia (I. flexuoſa); the many-ſpiked ixia (I. polyſtachia); the ſpotted ixia (I. maculata); and the crocus-flowered ixia (I. crocata.)

The firſt of theſe ſpecies varies with white and yellow flowers; with purpliſh and yellow flowers; with blue and white flowers; with white flowers; and with variegated flowers.

The third ſort alſo varies with the three inner ſegments of the corolla yellow, and the three outer green; with the three inner white yellow, and the three outer greeniſh; with the three inner blue white, and the three outer greeniſh; with the three inner white, and the three outer green; with corollas wholly yellow, or wholly blue, or roſe-coloured, with a yellow baſe; and in the ſize of the flowers.

The fourth ſort likewiſe varies with the corolla purple, red and white, yellow; with the ſcape very ſhort and ſimple, higher and branched, and bulbiferous.

The fifth ſpecies varies with the ſegments of the borders of the corolla of a deep and elegant purple violet colour within, three of them of the ſame colour on the outſide, but the three others alternately of a pale dirty violet; one of theſe, with two on the ſide of it, has a double band in the throat, meeting at one end; and, according to Mr. Saliſbury, with whitiſh corollas, having a purple ſtar, violet-coloured and yellow. Alſo in the figures of Miller, with the corolla of a beautiful purple on the outſide, but white within, and the ſtem terminated by two or three flowers; with the ſtalk terminated by two large flowers; the outſide of a violet colour, edged with white, and the inſide pale blue; and with one flower, and the corolla of a moſt beautiful purple colour, both within and without.

The ſeventh kind varies with the corollas yellow and violet, of one colour.

And the ninth ſort varies with a ſhort, ſimple, five-flowered ſcape, and a dark ſpot above the windowed, or hyaline one; with a lofty, many-ſpiked, many-flowered ſcape; and with bright red flowers.

Method of Culture.—Theſe plants may be increaſed by ſeeds or off-ſets from the roots.

The ſeeds of ſuch ſorts as can be procured ſhould be ſown in pots filled with light earth in the ſpring, plunging them in a mild hot-bed. When the plants have attained ſome growth, they ſhould be removed into ſeparate pots of the ſame earth, being placed under the protection of a frame till they have taken root. They ſhould be placed during the winter in a hot-bed frame. They may afterwards be removed into warm borders, being protected from froſts in the winter, and a few retained in pots under the frame, or in a dry ſtove.

But they are three or four years in flowering when raiſed from ſeeds.

The common way is, therefore, to increaſe them by planting off-ſets from the roots, which are afforded in great plenty; the proper ſeaſon for this is in the early ſpring, before the ſhooting of the root, when the roots ſhould be removed, and the off-ſets taken from them and planted out.

The old roots ſhould not be removed oftener than every three years.

As ſoon as the ſtems and leaves decay to the roots in the borders in autumn, they ſhould be covered over with tan a few inches thick, to protect them from froſt, and the depredations of mice.

The hardy ſorts ſerve to adorn the borders in the open ground, and the other tender ſorts among other potted green-houſe plants that require protection in winter.

IXIA, in *Surgery*, a dilated vein; a varix.

IXO, in *Geography*, a town of Japan, in the iſland of Niphon; 65 miles E.N.E. of Meaco.

IXORA, in *Botany*, ſo named from *Ixora*, a Malabar idol, to whom its flowers are offered by the Indians in their ſolemn feſtivals.—Linn. Gen. 54. Schreb. 70. Willd. Sp. Pl. v. 1. 609. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 1. 244. Juſſ. 203. Lamarck Dict. v. 3. 343. Illuſtr. t. 66. Gærtn. t. 25, and t. 95.—Claſs and order, *Tetrandria Monogynia*. Nat. Ord. *Stellatæ*, Linn. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, four-cleft, very ſmall, erect, permanent. *Cor.* of one petal, funnel ſhaped; tube cylindrical, ſlender, very long; limb four-cleft, flat; ſegments various in ſhape. *Stam.* Filaments four, riſing above the mouth of the corolla, very ſhort, incurved; anthers oblong. *Piſt.* Germen inferior, roundiſh, ſtyle thread-ſhaped, the length of the tube; ſtigma cloven. *Peric.* Berry roundiſh, two-celled. *Seeds* ſolitary, convex on one ſide, angulated on the other.

Obſ. Gærtner has remarked that the partition of the fruit is perforated juſt above the centre, and that the ſeeds are never more than two in each berry, though the Hortus Malabaricus deſcribes three or four. Sufficient characters are wanting to diſtinguiſh this genus from *Pavetta*.

Eſſ. Ch. Calyx four-toothed, ſuperior. Corolla of one petal; tube long, thread-ſhaped; limb four-cleft, widely ſpreading. Stamens riſing above the mouth. Stigma cloven. Berry of two cells. Seeds ſolitary.

The ſpecies of this fine Indian genus have not been in general clearly underſtood. We ſhall attempt an explanation of them, with an account of ſome hitherto entirely nondeſcript.

1. I. *coccinea.* Linn. Sp. Pl. ed. 1. 110. Lamarck Dict. v. 3. 342. (Schetti; Rheede Hort. Mal. v. 2. 17. t. 13. Jaſminum flore tetrapetalo, Ixora Linnæi; Burm. Zeyl. 125. t. 57.)—Leaves elliptic-obovate, ſomewhat heart-ſhaped at the baſe, not longer than the corymb. Segments of the corolla ovate, acute, flat. Style but little extended beyond the tube. Native of ſandy and ſtony places on the coaſt of Malabar, bearing flowers and fruit all the year. A *ſhrub* the height of a man, with round, ſmooth, greyiſh, leafy branches. *Leaves* oppoſite, nearly ſeſſile, two inches or more in length, about one broad, more or leſs obovate, or ſomewhat elliptical, obtuſe, entire, ſmooth, often pointed; their baſe for the moſt part heart-ſhaped, but varying in breadth; their upper ſide poliſhed. *Stipulas* embracing the ſtem in pairs, within the leaves, and alternate with them, awl-ſhaped, longer than the footſtalks, broad and triangular at their baſe. *Corymb* terminal, repeatedly forked, denſe, of from ten to thirty inodorous flowers; the ſtalks ſmooth and ſhining, red, as well as the *calyx*, whoſe ſegments are ovate or triangular, their points a little ſpreading. Tube of the *corolla* an inch and half long, very ſlender; ſegments of the limb each about half an inch long, horizontally ſpreading, ovate or elliptical, pointed. The hue of the limb, according to Rheede, is a fleſh-colour, deeper on the inſide, at length turning yellow and paler; the tube of a coral red. *Stamens* very ſmall and red, with yellow *anthers*, burſting longitudinally at their inner ſide into two cells. *Style* very little extended beyond the tube, with a thick red *ſtigma*, of two elliptical lobes, cohering in the dried ſpecimen. *Berries* the ſize of a ſmall currant, reddiſh-brown, ſhining, ſweet and eatable.—We have never met with this ſpecies in any garden.

2. I. *flammea.* Saliſ. Hort. 62. (I. chinenſis; Lamarck Dict. v. 3. 344. I. coccinea; Curt. Mag. t. 169. Schneev. Ic. t. 1. Ait. Hort. Kew. ed. 2. v. 1. 244. Flamma ſylvarum peregrina; Rumph. Amb. v. 4. 107. t. 47.)—Leaves elliptic-lanceolate, bluntiſh, ſtalked; narrow at the baſe. Segments of the corolla orbicular, obtuſe, rather convex. Style extended to half the length of the limb.—Native of Java, according to Rumphius; as well as of China, from whence we have a ſpecimen. It is not rare in our ſtoves, where the ſplendour of its flame-coloured flowers cauſes it to be much admired. Lamarck has well diſtinguiſhed it from the above, and Mr. Saliſbury long ago made the ſame remark. The *leaves* are five or ſix inches long, contracted at each end, ſtanding on ſhort, thick footſtalks. *Corymb* almoſt globoſe, compoſed of 100 flowers, or more, whoſe tube is but half, or two-thirds, the length of the former, but rather leſs ſlender; the ſegments of the limb broad and round, very obtuſe, each not ¼th of an inch long. *Stamens* ſpreading. *Style* rather longer than in the foregoing, with red ſpreading lobes of the ſtigma, but theſe cohere after drying.

3. I. *longifolia.* (Flamma ſylvarum; Rumph. Amb. v. 4. 105. t. 46.)—Leaves ovato-lanceolate, taper-pointed. Segments of the corolla elliptical, ſharpiſh, reflexed.—Native of moſt iſlands in the Eaſt Indies, according to Rumphius. We have a ſpecimen from the late Mr. Chriſtopher Smith, gathered in Honimoa. Thoſe who attend to Rumphius's deſcription and figure of his *Flamma ſylvarum*, and conſider that all his figures are diminiſhed, muſt be aware that his plant can belong to neither of the foregoing ſpecies, for which it has been quoted indifferently. Our ſpecimen exactly anſwers to his account, and is undoubtedly a new ſpecies. The *leaves* are ſeven or eight inches long, and two or three broad, ovate at the baſe, tapering at the end to a very fine point. *Footſtalks* half an inch long, channelled. *Stipulas* much ſhorter than in either of the former. *Corymbs* from the boſoms of the two upper leaves, as well as terminal, much branched from their very bottom, repeatedly forked, conſiſting of innumerable *flowers*, whoſe tube is as long and ſlender as in the firſt ſpecies, and of a light red; but the ſegments of the limb rather ſmaller, elliptical, not ovate, ſpreading widely, and more or leſs reflexed. The *ſtamens* are very ſhort. *Style* but little prominent. Rumphius ſays the flowers are of a vermilion hue on their inſide, which becomes a blood colour as they grow old, whence ariſes their brilliant fiery aſpect, the origin of the name. The *berries* turn firſt purple and finally black.

4. I. *incarnata.* Roxb. MSS.—Leaves elliptical, ſeſſile. Segments of the corolla roundiſh, obtuſe, ſomewhat reflexed. Corymb above half as long as the leaves.—Native of the Eaſt Indies. Our ſpecimen was communicated by lord viſcount Valentia, who received it from Dr. Roxburgh with the above name. The *leaves* are two inches long, and one

broad, nearly or quite ſeſſile, elliptical, ſlightly pointed. *Stipulas* with a very broad ſhort baſe, and ſhort ſlender point. *Corymb* about two-thirds the length of the leaves, denſe, level-topped, many-flowered. *Tube* of the flowers above an inch long, very ſlender; *limb* ſmall, its ſegments ſhaped much like I. *flammea*, but rather leſs. *Style* projecting above half their length. By the name we preſume the flowers are fleſh-coloured. In a dried ſtate their tube looks reddiſh, the limb pale.

5. I. *arborea.* Roxb. MSS. (I. Pavetta; Andr. Repoſ. t. 78.)—Leaves elliptic-oblong, on ſhort ſtalks. Segments of the corolla linear, obtuſe, reflexed, one-third the length of the tube. Corymb denſe, half as long as the leaves.—Native of the Eaſt Indies. It flowered in the dowager lady de Clifford's ſtove in the autumn of 1799, as Mr. Andrews mentions, but his name is altogether founded in error. The *leaves* are three or four inches long, and above one broad, coriaceous, widely ſpreading, on ſhort thick ſtalks; their baſe ſlightly heart-ſhaped. *Flowers* innumerable, dirty-white, ſmall, fragrant, in very denſe corymbs, whoſe ſtalks are a little downy; their tube is ſcarcely half an inch long, ſegments of the limb one-third as much, linear-oblong, recurved or reflexed, as are alſo the *anthers*. The *ſtyle* projects in ſome degree; the *ſtigma* is large and green, cloven, but not ſpreading.

6. I. *barbata.* Roxb. MSS.—Leaves elliptic-oblong, pointed, ſtalked. Segments of the corolla obovate, obtuſe, reflexed, denſely bearded at their baſe. Corymb ſpreading, equal to the leaves.—Brought by lord viſcount Valentia from the Eaſt Indies. The *leaves* are five or ſix inches long, two or more in breadth, with blunt points. *Footſtalks* half an inch long. *Corymbs* three at the end of the branch, equal, many-flowered, looſe and ſpreading, about as long as the leaves, and very broad. Tube of the flowers an inch and a quarter in length, ſlender at the baſe, but rather ſwelling upwards; *limb* reflexed, its ſegment $\frac{1}{4}$th of an inch long, obovate, obtuſe, twiſted in the bud, revolute when dry, denſely bearded at their baſe only, about the orifice of the tube, with longiſh white hairs. The colour of the *flowers* ſeems to be reddiſh.

7. I. *undulata.* Roxb. MSS.—Leaves ovate, pointed, ſtalked. Segments of the corolla oblong, reflexed, ſmooth, half as long as the tube. Corymbs numerous, denſe, panicled.—For this alſo we are obliged to lord Valentia, who received it, with the two laſt, from Dr. Roxburgh. The *leaves,* about four or five inches long, are of a broad ovate figure, tapering to a point; their edges wavy. *Footſtalks* above half an inch long. *Panicles* terminal, longer than the leaves, repeatedly forked, ſpreading, each branch terminating in a denſe many-flowered corymb. The *tube* is about half an inch long, not very ſlender, reddiſh; *limb* and *ſtamens* half that length, reflexed. *Style* projecting to the extent of the limb.

8. *I. laxiflora.*—Leaves elliptic-oblong. Segments of the corolla ſpreading, convex, bearded on their upper ſurface. Panicle corymboſe, lax, widely ſpreading, longer than the leaves. Gathered at Sierra Leone, by Dr. Adam Afzelius, to whom we are obliged for a ſpecimen, and the publication of whoſe rich diſcoveries is much to be deſired, though he himſelf has hitherto been unable to attain that object. We wiſh to ſecure his fame, not to encroach upon it. The *leaves* of this ſpecies are two or three inches long, and rather above an inch wide, all ſomewhat pointed; the uppermoſt rounded at the baſe, and quite ſeſſile; the reſt tapering down into a winged foot-ſtalk. *Stipulas* with ſhort points. *Panicles* terminal, ſolitary, ſtalked, nearly twice as long as the leaves, many-flowered, repeatedly branched and divaricated, ſlender and lax. *Calyx* tubular, with very ſhort rounded teeth. *Tube* of the corolla an inch long, very ſlender, ſlightly ſwelling upwards; ſegments of the *limb* one-third as long, obovate with a ſmall recurved point; their edges reflexed, their diſk hairy half way along the middle from the baſe. *Stamens* very ſhort. *Style* projecting almoſt the length of the limb, with long, nearly linear, ſtigmas. We have no account of the colour of the *flowers.* In the dried ſpecimen they are dark brown, with a purpliſh tinge.

9. I. *parviflora.* Vahl. Symb. v. 3. 11. t. 52. Ait. Hort. Kew. ed. 2. v. 1. 244.—Leaves nearly ſeſſile, lanceolate-oblong. Corymbs denſe, panicled. Segments of the corolla elliptical, reflexed, one-fourth the length of the tube.—Native of the Eaſt Indies. We have a ſpecimen ſent by Koenig to Linnæus, which was never deſcribed, but we have no doubt of its being Vahl's plant. The *leaves* in our's are two or three inches long, or more, lanceolate inclining to obovate, coriaceous, reticulated with veins. *Footſtalks* thick and very ſhort. *Stipulas* broad and ſhort, with a rigid ſtraight point. *Panicle* rather longer than the leaves, erect, ſtraight, branched from the bottom; the branches downy, each bearing a denſe corymb of red *flowers,* whoſe tube is about half an inch long, not very ſlender, and whoſe limb is ſcarcely one-fourth that length, its ſegments elliptical, and ſmooth.

10. I. *alba.* Linn. Sp. Pl. ed. 1. 244. (Bem-ſchetti; Rheede Hort. Mal. v. 2. 19. t. 14.)—Leaves elliptic-lanceolate, pointed, ſtalked. Panicle corymboſe, ſtalked, of few flowers. Segments of the corolla ovato-lanceolate, acute, about half as long as the tube.—Native of the Eaſt Indies. This ſpecies ſtands on the authority of the *Hortus Malabaricus,* whence Linnæus adopted it, for there is no ſpecimen in his herbarium, and the ſynonym of Plukenet, t. 109. f. 2, ſurely belongs to our firſt ſpecies of all. Miller is ſaid in Hort. Kew. to have cultivated *I. alba* before 1768, but we have never been able to ſatisfy ourſelves concerning this ſpecies in any garden. A ſpecimen in fruit from profeſſor David Van Royen, of what he had from Thunberg under this name, agrees tolerably with Rheede's figure, though the fruit being globoſe, or rather depreſſed, not elliptical, is an exception, neither is our ſaid fruit didymous, like Gærtner's t. 95. Rheede contraſts his plants with the true *I. coccinea,* his *Schetti,* t. 13, juſtly ſaying that the *leaves* are rather longer, more pointed at the end, and contracted at the baſe. The *flowers* are white or yellowiſh, with a reddiſh tube. *Stamens* longiſh and ſlender. *Style* prominent. *Fruit* more oblong than round, pale green or yellowiſh.

11. I. *americana.* Linn. Am. Acad. v. 5. 393; excluding the ſynonym of Plumier. Sp. Pl. ed. 2. 160; excluding the ſyn. of Browne. (Peteſia, N° 1; Brown. Jam. 145. t. 2. f. 3.)—Leaves elliptical, pointed at each end, on long downy footſtalks. Panicles axillary, downy; their branches cymoſe.—Gathered by Dr. P. Browne near the waterfall is Mammee river in Jamaica. His own ſpecimen is before us, ſhewing how much Linnæus has confuſed the hiſtory of this plant, by a miſquotation of ſynonyms that belong to *Coffea occidentalis,* hence leading Lamarck to ſuppoſe theſe two very diſtinct ſhrubs might be one and the ſame. We are not however by any means of opinion that the preſent is a real *Ixora,* but till its fruit be better known, the queſtion cannot be decided. Dr. Swartz appears not to have touched upon it. The *leaves* grow by threes, on ſtalks about an inch and half long, half their own length. The *flowers* are very ſmall, ſhort, thick, and downy, truly cymoſe, at the ends of long forked panicles.

12. I? *multiflora.* Swartz. Ind. Occ. v. 1. 240. Willd.

n. 6.—“ Leaves lanceolate-ovate, cluſtered. Flower-ſtalks aggregate, ſingle-flowered, very ſhort. Berries with one ſeed.”—Native of Jamaica. A ſtill more doubtful *Ixora* than the laſt, or rather a *ſhrub* of a diſtinct genus. Dr. Wright, to whom we are obliged for a ſpecimen, obſerves that “ the *ſtamens* are in the bottom of the *corolla ;* the *berry* white, ſmall, ſweet, with a ſingle compreſſed ſeed.”—The ſmall box-like *leaves*, and denſe tufts of *flowers* from lateral buds, are quite foreign to this genus, as is the ſwelling tube of the *corolla*.

I. *faſciculata*, Sw. Prodr. 30, is now by that author himſelf removed to *Chomelia*, Fl. Ind. Occ. v. 1. 238.

How far the *Pavetta* of authors, or any of the ſpecies ranged under it, may be referable to *Ixora*, we are not at preſent competent to determine, but we are well aſſured that their generic characters require inveſtigation. S.

Ixora, in *Gardening*, comprehends plants of the ſhrubby, flowering, exotic kinds, of which the ſpecies moſtly cultivated are, the ſcarlet ixora (I. coccinea) ; and the white ixora (I. alba).

Method of Culture.—Theſe plants may be increaſed by ſeeds, when they can be procured from the countries where they grow naturally, as they do not perfect them in this climate. They ſhould be ſown in ſmall pots as ſoon as they arrive, and be plunged into a hot-bed when they arrive in the autumn or winter ſeaſons, the pots being plunged in the tan-bed in the ſtove ; but when they come in the ſpring, it is beſt to plunge them in a tan-bed under frames. The ſeeds ſometimes come up in about ſix weeks, if they are quite freſh ; otherwiſe they lie in the ground four or five months, or longer. The earth ſhould therefore not be thrown out of the pots till there are no hopes of their growing. When the plants come up, and are fit to remove, they ſhould be each planted in a ſeparate ſmall pot, filled with light earth, being preſerved in the green-houſe or ſtove.

They may alſo be increaſed by cuttings, which ſhould be planted during the ſummer months, in ſmall pots, and plunged into a moderate hot-bed, covering them cloſe either with bell or hand glaſſes, to exclude the external air, ſhading them from the ſun in the heat of the day, until they have put out good roots, when they ſhould be parted, and each put into a ſeparate pot, treating them as the ſeedling plants. Mr. Curtis thinks it probable, that theſe plants are leſs tender than is ſuppoſed.

They afford variety among other ſtove or green-houſe plants.

IXWORTH, in *Geography*, a town of England, in the county of Suffolk, with a weekly market on Friday ; 78 miles N.N.E. of London.

IYAR, in *Chronology*, the ſecond month of the eccleſiaſtical Jewiſh year, anſwering to part of our April and May.

JYENAGUR, or Joinagur, called alſo *Jyepour* and *Jaepour*, in *Geography*, a circar or province of Hindooſtan, ſituated S. of the Mewat. The capital of this circar is Jaepour or Jaynagur; 70 miles E.N.E. of Agimere. N. lat. 26° 58′. E. long. 26° 9′. The raja of Jaepour, called Jeſſing, has erected two obſervatories, one in his newly built capital of Jaepour, which is about a league from Umbeer, or Ambeer, the ancient capital, the other in one of the ſuburbs of Delhi. At the former obſervatory father Claud Boudier, at the rajah's requeſt, made ſome obſervations in 1732 ; and probably, by the aſſiſtance of the ſame rajah, at Agra and Delhi.

JYEPOUR, a town of Hindooſtan, in the circar of Cattack : 16 miles N.E. of Cattack.

JYTEPOUR, a town of Hindooſtan, in Bundelcund ; 18 miles N.E. of Chatterpour.

JYVASKYLA, a town of Sweden, in the government of Waſa ; 120 miles S.E. of Waſa.

IZENDICK, a town of France, in the department of the Scheldt, and chief place of a canton, in the diſtrict of L'Ecluſe. The place contains 1121, and the canton 5001 inhabitants, on a territory of 112½ kiliometres, in five communes.

IZER, a town of Africa, in the weſtern part of the country of Berdoa.

IZIGINSK, a town of Ruſſia, in the government of Irkutſk, on the river Izigin, about 15 miles from its mouth. It is defended by an encloſure of paliſades, and wooden baſtions, erected in piles at the four angles. Theſe baſtions are provided with cannon, and a variety of military ſtores. The governor's houſe is defended by a conſtant guard. The houſes are conſtructed of wood, low, and having a regular front. The number of inhabitants is about 5 or 600, who are either merchants, or in the ſervice of government. The commerce conſiſts of furs, and the ſkins of rein deer. N. lat. 63° 10′. E. long. 159° 14′.

IZIUK, a town of Ruſſia, in the government of Toboliſk, on the Irtiſch ; 240 miles E.S.E. of Toboliſk.

IZIUM, a town of Ruſſia, in the government of Charkov, on the river Donetz ; 64 miles S.E. of Charkov.

IZQUITENANGO, a town of Mexico, in the province of Chiapa.

IZTICHUILOTLI, in *Natural Hiſtory*, the American name of a ſtone found in New Spain, and ſome other places ; it is very hard, of a beautiful black, and takes a fine poliſh. The Americans are very fond of it as a gem, and wear it by way of ornament.

De Laet mentions an American ſtone in his poſſeſſion, which was cut by the Indians into a flat oval plate, and was of a beautiful black, but with two round ſpots of a ſilvery white. He ſuppoſes this to have been the uterinus lapis, and probably it was either that ſtone, or of the ſpecies here mentioned.

IZTICPASO-QUERZALIZTLI, the name given by the natives of ſome parts of America, to a ſtone famous for its virtues in curing colic, and many other diſeaſes, externally applied. It is of a beautiful green colour, and is by Ximenes ſuppoſed a coarſe ſpecies of emerald ; but is more properly a very fine kind of lapis nephriticus, of a pale green colour, very hard, and more pellucid than the other ſpecies of that ſtone, but yet always ſhewing that greaſy look on being poliſhed, which characterizes all the nephritic ſtones. It is uſually found in large maſſes, and the Indians cut it into flat pieces, which they apply to the navel in the colic, and in other diſeaſes to the part affected, and ſuppoſe it has great power in promoting a diſcharge of the noxious humours.

IZTLI, the American name of a ſpecies of ſtone, of which the natives made their weapons of war, &c. before they knew the uſe of iron. It is called by De Laet and other authors, lapis novacularum.

K.

K, A double conſonant, and the tenth letter of the alphabet.

This conſonant has the ſound of hard *c*, and is uſed before *e* and *i*, where, according to the Engliſh analogy, *c* would be ſoft; as in the words *kept*, *king:* at the end of words it is not much uſed, except after *c*, and chiefly in monoſyllables, as *clock*, *back*, &c. It is now properly omitted in many other words, as *muſic*, *public*, &c. It is alſo uſed between a vowel and the ſilent *e* final, as *cloke*, *broke*, &c. It likewiſe ends a word after a diphthong, as *look*, *break*, &c. In the preſent pronunciation, *k* is ſilent before *n*, as *knee*, *knell.* It is never doubled; but *c* is uſed before it, to ſhorten the vowel by a double conſonant, as *cŏckle*, *pĭckle.*

K is borrowed from the Greek *kappa*, and was but little uſed among the Latins. Priſcian looked on it as a ſuperfluous letter, and ſays it was never to be uſed except in words borrowed from the Greek. Dauſquius, after Sallus, obſerves, that it was unknown to the ancient Romans. Indeed we ſeldom find it in any Latin authors, excepting in the word *kalendæ*, where it ſometimes ſtands in lieu of a *c*. Carthage, however, is frequently ſpelt on medals with a K: SALVIS AVG. ET CAES. FEL. KART. and ſometimes the letter K alone ſtood for *Carthage.*—M. Berger has obſerved, that a capital K, on the reverſe of the medals of the emperors of Conſtantinople, ſignified KONSTANTINUS; and on the Greek medals he will have it to ſignify ΚΟΙΛΗ ΣΥΡΙΑ, Cœleſyria.

Quintilian tells us, that in his time ſome people had a miſtaken notion, that wherever the letter *c* and *a* occurred at the beginning of a word, *k* ought to be uſed inſtead of the *c*. See C.

Lipſius obſerves, that K was a ſtigma, anciently marked on the foreheads of criminals with a red-hot iron.

The letter K has various ſignifications in old charters and diplomas; for inſtance KR. ſtood for *chorus*, K.R.C. for *cara civitas*, KRM. for *carmen*. KR. AM. N. *carus amicus noſter*. KS. *chaos*. K.T. *capite tonſus*, &c.

The French never uſe the letter *k*, excepting in a few terms of art, and proper names borrowed from other countries. Ablancourt, in his dialogue of the letters, brings in *k* complaining, that he has been often in a fair way to be baniſhed out of the French alphabet, and confined to the countries of the North.

K is alſo a numeral letter, ſignifying 250, according to the verſe:

> " K quoque ducentos et quinquaginta tenebit."

When it had a ſtroke at top, $\overline{\text{K}}$, it ſtood for 250,000.

K, on the French coinage, denotes money coined at Bourdeaux.

The letter K is the initial of no muſical term; and as moſt of the muſical technica are derived from the Italian, in which language K has no admiſſion, the Greek *kappa*, and the hard *c* being ſupplied by *che*, this letter will chiefly occur in German words, and proper names.

KAABA. See CAABA.

KAADE, in *Geography*, a town of Arabia Felix, in the province of Yemen; 12 miles N. of Taas.

KAALING, in *Ornithology*, the name of a ſpecies of ſtarling, common in China, and not unfrequent in the Philippine iſlands. It is black; but its eyes, legs, and beak are yellow. It is eaſily kept tame, and may be taught both to ſing and talk. It eats rice and inſects in its wild ſtate; but when kept in a cage, will feed very heartily on bread, and all kinds of fruit.

KAARTA, in *Geography*, a conſiderable ſtate of Africa, bounded on the N. by Ludamar, on the E. by Bambarra, on the S. by Fooladoo and Manding, and on the W. by Kaſſon and Fooladoo; about 200 miles long and 80 broad. Its capital was formerly a large and populous town, called Kemmoo; which has been ſince deſtroyed. The ſovereign of Kaarta received Mr. Park with great kindneſs; and major Houghton was the only European whom he had ever before ſeen. The language of the country ſeemed to Mr. Park to be formed of a mixture of the Mandingo and Sera-Woolli; but the Mandingo was generally underſtood. N. lat. 13° 10′ to 15°. W. long. 5° 10′ to 8° 20′.

KAAT's KILL, or CATSKILL, a ſmall, but thriving place in America, in Green county, and ſtate of New York, on a creek of the ſame name, W. of Hudſon's river; 5 miles S. of Hudſon city, and 125 N. of New York. In its vicinity are Kaat's Kill mountains, which are the firſt part of a chain of mountains, called the Alleghany, or Appalachian mountains. The townſhip of this name contains 2468 inhabitants.

KAAU-BOERHAAVE, ABRAHAM, in *Biography*. See BOERHAAVE, ABRAHAM KAAU.

KAAWI, in *Geography*, a town of Sweden, in the government of Kuopio; 22 miles E.N.E. of Kuopio.

KAB, in the *Jewiſh Antiquity*. See CAB.

KABALA, in *Geography*, a town of Perſia, in the province of Schirvan; 36 miles S.S.W. of Scamachie.

KABANI, in the *Oriental Offices*, a perſon who ſupplies the place of what we call the notary public. All obligations that are valid are drawn by him; and he is likewiſe the public weigh-maſter, and every thing of conſequence ought to be weighed before him.

KABANSKOI, in *Geography*, a town of Ruſſia, in the government of Irkutſk; 28 miles W.N.W. of Verchnei-Udinſk.

KABARDA, a town of Ruſſia, in the government of Caucaſus; 32 miles E. of Ekaterinograd.

KABASSI, a town of European Turkey, in the province of Albania; 24 miles N. of Aleſſio.

KABASSON, in *Zoology*. See DASYPUS *Unicinctus*.

KABBA, in *Geography*, a town of Africa, in the kingdom of Bambarra, ſeated on the Niger; 10 miles N.E. of Sego. It is ſituated, ſays Mr. Park, in the midſt of a beautiful and highly cultivated country, bearing a conſiderable reſemblance to the central part of England, and abounding with the "ſhea" tree, the fruit of which produces the ſheatoulou, or tree-butter. The tree very much reſembles the American oak, and the root, from the kernel of which the butter is prepared, by boiling it in water, has ſomewhat the appearance of a Spaniſh olive. The butter produced by it, beſides the advantage of its keeping without ſalt, is, in Mr. Park's opinion, whiter, firmer, and of a richer flavour than the beſt butter he ever taſted made from cow's milk. The growth and preparation of this commodity ſeem to be among the firſt objects of African induſtry, in this and the neighbouring ſtates, and it conſtitutes a main article of their inland commerce.

KABBADE, or CABADE, the name of a military habit of the modern Greeks, which they wear under another garment.

KABBALA. See CABBALA.

KABBOS, in *Ichthyology*, the name of an Eaſt Indian fiſh of the Muſtela kind. It grows to about two feet long, has no ſcales, but feels ſmooth and ſoft like the eel, and is of a brown colour; the noſe or ſnout much paler than the reſt, and ſpotted with black. The head is obtuſe, and the eyes placed very near the extremity of it.

KABERAN, in *Geography*, a town of Perſia, in the province of Khoraſan; 45 miles E. of Meſchid.

KABESQUI, or CABESQUI, is the name of a piece of money, equal in value to five deniers and a *maille* of French, coined and current only in Perſia.

KABESTERA, in *Geography*, a diſtrict of Africa, on the Gold Coaſt.

KABIKI, a town of Japan, in the iſland of Niphon; 25 miles S.W. of Nigata.

KABIN, KHABIN, *Kebin*, or *Kubin*, a temporary kind of marriage, in uſe among the Mahometans.

The kabin is contracted before the cadi, in whoſe preſence the man eſpouſes the woman for a certain time, upon condition that if he quits her at the end of that term, ſhe ſhall be allowed a certain ſum of money.

Some authors ſay that the kabin is only permitted among the Perſians, and in the ſect of Ali; but others maintain that it is practiſed among the Turks.

KABIS, CHABIS, or *Gabbis*, in *Geography*, a town of Perſia, in the province of Kerman. N. lat. 31°. E. long. 57 50′.

KABOJA, a town of Japan, in the iſland of Niphon; 90 miles W. of Meaco.

KABRA, a town of Africa, in the kingdom of Tombuctoo, on the N. ſide of the Niger; 8 miles S.E. of Tombuctoo.

KABREND, a town of Perſia, in Farſiſtan; 38 leagues S. of Schiras.

KABROANG, one of the Silibabo iſlands, in the Eaſt Indian ſea, about 18 miles in circuit. N. lat. 3° 50′. E. long. 126° 30′.

KABRUA, a town of European Turkey, in Bulgaria; 16 miles S. of Ternova.

KACHAN, a town of Perſia, in the province of Irac; 35 leagues N. of Iſpahan.

KACHAO, a town of Africa, in the kingdom of Kambu, on the river San Domingo, about 50 miles from its mouth; ſurrounded with a rampart and paliſades, and defended by artillery and a Portugueſe garriſon. It has a pariſh church, and a convent of Capuchins. N. lat. 12° 6′. W. long. 16°.

KACHIRA, a diſtrict of the government of Tula, in Ruſſia, on the Occa.

KACHTAN, a diſtrict or territory of Arabia, in the province of Yemen. It is of ſmall extent, and lies among the mountains, about three days' journey northward from Nedſjeran. It is governed by a ſchieck.

KACIAZYN, a town of Lithuania, in the palatinate of Wilna; 36 miles N.E. of Wilna.

KACOVA, a town of Tranſylvania; 12 miles S. of Coloſvar.

KACUNDY, a town of Africa, in the country of the Foulahs, ſeated on the E. ſide of the river Nunez; not far from its opening into the Atlantic.

KADAN, or CAADAN, a town of Bohemia, in the circle of Saatz; 12 miles W. of Saatz. N. lat. 50 20′. E. long. 13° 16′.

KADAR, a town of Mingrelia; 16 miles N.N.E. of Anerghia.

KADANAKU, in *Gardening*, the name of a plant. See ALOE.

KADARI, or KADARITES. See CADARI.

KADELY, a town of Bengal; 8 miles N.W. of Ramgur.

KADEN, in *Geography*, a town of Ruſſian Lithuania, in Poleſia; 14 miles S. of Brzeſc.

KADEN-KAN, a town of Aſiatic Turkey, in Caramania; 28 miles W. of Cogni.

KADER, an iſland at the N.W. extremity of the Perſian gulf, formed between the ſtreams of the Euphrates and the Tigris.

KADESIA, a town in the Arabian Irak; 80 miles S.W. of Bagdad.

KADJANG, a town on the W. coaſt of the iſland of Celebes. S. lat. 6° 28′. E. long. 119° 50′.

KADIEI, or KADYI, a town and diſtrict of Ruſſia, in the government of Koſtroma; 68 miles E.N.E. of Koſtroma.

KADITTE, a town of Pruſſia, in the circle of Natangen; 23 miles S. of Brandenburg.

KADNIKOV, a town and diſtrict of Ruſſia, in the government of Vologda; 10 miles N.N.E. of Vologda.

KADOM, a town and diſtrict of Ruſſia, in the government of Tambov, or Tambof, on the river Mokcha; 108 miles N.N.E. of Tambov.

KADRAGUTA, a town of Hindooſtan, in the circar of Singboom; 40 miles S.E. of Doeſa.

KADROS, a town of Aſiatic Turkey, in Natolia; 28 miles E. of Amaſieh.

KADSINDA, a town of Japan, in the iſland of Niphon; 30 miles S.W. of Nambu.

KADZURIM, a town of Hindooſtan, in Bahar; 12 miles N.E. of Rotaſgur.

KÆADAS, καιαδας, among the Lacedæmonians, a dungeon for throwing their criminals into. It was of the ſame nature with the Athenian barathron, or orygma.

KÆKURIAGHAKA, in *Botany*, a name uſed by ſome authors for the tree which affords the gum elemi of the ſhops.

KÆMPFER, ENGELBERT, in *Biography*, a celebrated German phyſician and naturaliſt, was born, in the year 1651, at Lippe, in Weſtphalia. It appears that he was educated in Sweden, where, for ſome years, he cultivated with zeal and ſucceſs the ſeveral ſtudies of phyſic, natural philoſophy, and natural hiſtory. His great deſire for travelling made him ſeize with avidity an opportunity of accompanying the Swediſh ambaſſador Fabricius to Perſia; whom he attended in the capacity of ſecretary. He departed from Stockholm in 1683; ſpent a ſhort time at Moſcow, and then proceeded to Iſpahan, where he remained two years. His ardour in the purſuit of knowledge had ſo much increaſed during this period, that inſtead of returning with Fabricius, he obtained the appointment of chief ſurgeon to the Dutch Eaſt India company, in which capacity he had the full enjoyment of his wiſhes, for he penetrated as far as the kingdoms of Siam and Japan. The geography of theſe parts had been but very imperfectly known, till Kæmpfer's genius and induſtry ſupplied the deficiency, and the world is indebted to him, for having firſt given a correct idea of the ſituation of different places, which had before been inacceſſible to ſtrangers. On his return to Europe in 1694, he graduated at Leyden, and ſettled in his own country. Here he did not remain idle, but was conſtantly employed in the compoſition of ſeveral works, and in the practice of phyſic. He was appointed phyſician to his ſovereign, and terminated a uſeful life in the year 1716, aged 65. His inaugural diſſertation, publiſhed at Leyden in 1694, is intitled "Decas obſervationum exoticarum." Of this a copy is preſerved in Dr. Smith's library, but we have never met with any other. The ſubjects on which it treats are, 1, the *Agnus Scythicus*, or Borometz: 2, the bitterneſs of the Caſpian ſea: 3, of the native *Mumia*, or bitumen, of Perſia: 4, of the Torpedo, or electrical fiſh of the Perſian gulf: 5, of the drug called dragon's blood, produced by the fruit of a palm: 6, of the *Dracunculus* of the Perſians, a ſort of worm proceeding from a tumour in the ſkin: 7, on the *Andrum*, or endemic hydrocele of the Malabars: 8, on the *Perical*, or ulcer of the feet among the ſame people: 9, on the cure of the colic amongſt the Japaneſe by puncture with a needle: 10, on the *Moxa*, or actual cautery, of the ſame people and the Chineſe. Theſe ſubjects are, as Haller obſerves, all of them probably treated more fully in the great work of our author, publiſhed at Lemgow in 1712, entitled "Amoenitates Exoticæ," and ſo often quoted by Linnæus for its botany, as well as other authors for its authentic details, relating to the hiſtory and manners of Perſia, and other parts of the Eaſt. His hiſtory of Japan is well known by the Engliſh tranſlation in folio, and is extremely valued for its accuracy and fidelity. Kæmpfer was ſkilled in the uſe of the pencil, as the plates of his works teſtify. Some botanical drawings of his, made in Japan, are preſerved in the Britiſh Muſeum. Of theſe ſir Joſeph Banks, in 1791, liberally preſented the learned world with 59 folio engravings at his own expence. Many of the plants are ſtill undetermined by ſyſtematic botaniſts. Hall. Bibl. Bot. Kæmpf. Opera.

KÆMPFERIA, in *Botany*, named by Linnæus in commemoration of KÆMPFER, (ſee that article,) was ſelected for that purpoſe with the more propriety, becauſe of the excellent original account and figure given of the plant by this writer, in his valuable *Amoenitates Exoticæ*, 901.—Linn. Gen. 4. Schreb. 5. Willd. Sp. Pl. v. 1. 15. Mart. Mill. Dict. v. 3. Roſcoe Tr. of Linn. Soc. v. 8. 350. t. 20. f. 10. Dryandr. in Ait. Hort. Kew. ed. 2. v. 1. 7. Juſſ. 64. Lamarck Illuſtr. t. 1.—Claſs and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Linn. Roſcoe. *Cannæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, tubular, ſheathing, membranous, ſplitting on one ſide. *Cor.* of one petal; tube about as long as the calyx, cylindrical, erect; outer limb in three equal, ſpreading, linear, acute, involute ſegments; inner two-lipped, the upper lip of two oblong lobes, lower of one or two broader, rounded, ſpreading ones. *Stam.* Filament one, erect, oblong, flat, much ſhorter than the limb, extending much above the anther, and terminating in two ſpreading equal lobes; anther attached by its back to the middle of the filament, of two oblong, nearly marginal, rather diſtant lobes, meeting round the ſtyle, burſting at their outer edge. *Piſt.* Germen inferior, ſmall, roundiſh; ſtyle thread-ſhaped, embraced by the anther; ſtigma cup-ſhapped, concave, fringed, projecting a little beyond the anther. *Peric.* Capſule roundiſh, ſomewhat triangular, of three cells and three valves. *Seeds* ſeveral.

Eſſ. Ch. Anther two-lobed. Filament extending above the anther, two-lobed at the top. Outer limb of the corolla in three equal, linear, acute lobes; inner two-lipped.

1. K. *Galanga*. Galangale. Linn. Sp. Pl. 3. Hort. Cliff. 2. t. 3. Redout. Liliac. t. 144. Sims in Curt. Mag. t. 850. (Wanhom; Kæmpf. Amoen. Exot. 901. t. 902.)—Upper ſegments of the inner limb of the corolla obtuſe, ſlightly three-lobed; lower ones deeply ſeparated, undulated. Leaves depreſſed, broad-ovate, pale beneath.—Native of the Eaſt Indies. Kæmpfer met with it in Japan in a cultivated ſtate only. With us it is rare; kept in the ſtove, and flowering in July. The *root* is perennial, tuberous, throwing out elliptical ſtalked knobs, like the Peony. Theſe are fleſhy and white within, with a grateful and pungent aromatic flavour, which remains long after they are dried. They are ſtill uſed in the Eaſt for their ſtomachic and tonic properties, but are laid aſide in European practice. *Stem* none. *Leaves* ſeveral, ſheathing, ſpreading in a depreſſed poſition, three or four inches long, and nearly as broad, many-ribbed; dark-green, and ſmooth above; paler, glaucous and downy beneath. *Flowers* ſeveral, radical, ſeſſile, in the centre of the leaves, white, with two purple ſpots at the baſe of the lower or front lobes of the inner limb. We cannot help remarking the ſuperiority of Linnæus's fine engraved plate over any coloured one that has met our notice.

2. K. *rotunda*. Round-rooted Kæmpferia. Linn. Sp. Pl. 3. Sims in Curt. Mag. t. 920. Woodv. Med. Bot. t. 133. (K. longa; Jacq. Hort. Schoenbr. v. 3. 37. t. 317. Redout. Liliac. t. 49. Malan-kua; Rheede Hort. Mal. v. 11. 17. t. 9.)—Upper ſegments of the inner limb of the corolla acute, entire; lower ones deeply ſeparated, obovate. Leaves erect, elliptic-oblong, acute, coloured beneath.—Native of the Eaſt Indies. Mr. Miller is ſaid to have cultivated it in 1768, but the plants, now not unfrequent in the ſtoves of this country, all probably originated from what ſir George Yonge introduced in 1791. The knobs of the *roots*, rather leſs oblong than thoſe of the former, are pungent and aromatic. The *leaves* grow upright, and are a foot long, remarkable for the fine purple colour of their under ſide. The *flowers* appear early in the ſpring, before the leaves, with a few ſheathing green bracteas that grow likewiſe from the root. They are ſweet-ſcented, white, except the lower lip, which is of a light purple, prettily variegated.

3. K. *anguſtifolia*. Narrow-leaved Kæmpferia. Roſcoe Tr. of Linn. Soc. v. 8. 351.—Upper ſegments of the inner limb of the corolla linear, obtuſe; lower one emarginate. Leaves lanceolate, pale beneath.—Native of the Eaſt Indies, from whence it was introduced into the Kew garden in 1797 by ſir Joſeph Banks. It flowers in the ſtove, about March or April. Mr. Roſcoe examined it in the botanic garden at Liverpool, and all our knowledge of this ſpecies is comprized in the above definition.

4. K. *ovata*. Ovate Kæmpferia. Roſcoe, ibid. (Manjakua; Rheede Hort. Mal. v. 11. 19. t. 10.)—Lower ſegment of the inner limb of the corolla lanceolate, undivided. Leaves ovate.—All our knowledge of this plant is derived from the Hortus Malabaricus, from whence Mr. Roſcoe

adopted it, there being no doubt of the genus. It is there ſaid to be perennial, flowering in April and May. The *root* is a globoſe tuber, an inch in diameter, yellow internally, with concentric red and orange lines; of a very ſtrong taſte and ſmell, reſembling ginger and ſaffron. *Leaves* a foot long, elliptical, pointed, tapering down into ſheathing footſtalks, of a pleaſant ſcent and bitteriſh taſte. *Flowers* ſix or ſeven from the centre among the leaves, ſhort-lived, white with a tinge of red, their tube much longer than the limb. Rheede's figure diſplays the generic character ſufficiently well, and ſhews the lip, or lower ſegment of the inner limb to be undivided, ovate, acute, and wavy. *Seeds* rarely perfected. The *Curcuma rotunda* of Linnæus ſeems chiefly to depend on this ſynonym of Rheede. His herbarium throws no light upon the matter.

KÆMPFERIA *Rotunda*, in the *Materia Medica*. See ZEDOARY.

KAEN, in *Geography*, a town of Africa, and capital of a kingdom, on the banks of the river Gambia. N. lat. 13°.

KAFAR TUTHA, a town of Aſiatic Turkey, in the province of Diarbekir; 32 miles S.W. of Niſibin.

KAFER, a town of Perſia, in the province of Farſiſtan; 40 miles S. of Schiras.

KAFFABA, a town of Africa, and capital of a kingdom of the ſame name, in Soudan. N. lat. 11° 45′. W. long. 0° 12′.

KAFFERS, or rather KOUSSIS, a tribe of people who inhabit thoſe parts of Africa that lie to the north and eaſt of the colony of the Cape of Good Hope. Mr. Barrow has not been able to aſcertain how far the belt of country extends in width acroſs the ſouthern part of Africa, that is inhabited by the Kaffers; but the points on each coaſt to which they do not extend are ſufficiently determined. To the ſouthward of the Portugueſe ſettlement of Rio de la Goa, the natives are Kaffers, but appear to be a degenerated race. They are, however, *free;* nor has Portugueſe avarice yet dared to attempt to make them ſlaves. This is not the caſe to the northward. At Mozambique and Soffala, the black people are all negroes; not indeed the natives of the ſea-coaſt, but ſuch as are brought down from the interior as articles of trade. From Mozambique, they have now a direct communication acroſs the continent with their ſettlements of Congo, Loango, and Benguela, on the weſt coaſt, as appears from the information of a Portugueſe ſlave merchant, between which negro merchants are eſtabliſhed in different parts of the country. In the line of this route there are therefore no Kaffers. It further appears that another powerful tribe of the ſame nation, called "Baroloos," inhabit the country under the ſouthern tropic, nor are theſe the laſt to the northward. According to the account given of this people, they are of a kind and friendly diſpoſition; their town is ſo extenſive, that if a perſon ſet out in a morning from one extremity and travelled to the other, he would not be able to return before the following day; and contains many thouſand inhabitants; the people are very ingenious in carving of wood, and have furnaces for ſmelting both copper and iron: they are very rich in cattle, and their gardens and lands are better cultivated, and their dwellings much ſuperior to thoſe of *Leetakoo*, which ſee. The "Damaras" alſo, who poſſeſs the art of ſmelting copper from the ore, are inhabitants of the tropic; and they are complete Kaffers, differing in no reſpect from thoſe on the eaſtern coaſt. Mr. Barrow, therefore, ſuppoſes, that a line drawn from the 24th parallel of latitude on the E. coaſt to the 20th on the W., may nearly mark the boundary between the Kaffers and the Negroes.

An open and manly deportment, ſays Mr. Barrow, free from ſuſpicion, fear, or embarraſſment, ſeems to characterize the Kaffer chiefs. Though extremely good-humoured, benevolent, and hoſpitable, they are neither ſo pliant nor ſo paſſive as the Hottentot. Thoſe of the poorer claſs ſometimes ſeek for ſervice among the boors, and engage themſelves for ſo many moons in conſideration of ſo many head of cattle; but they never ſuffer themſelves to be duped out of their hire like the eaſy Hottentots. They are for the moſt part tall, upright, and well-made men; and in their ſtature and ſtrength they exhibit ſatisfactory evidence that animal food is by no means neceſſary to promote the growth of the human ſpecies, or to add ſtrength of fibre to the muſcular parts of the body. Milk in a curdled ſtate is the principal food of the Kaffers. To this they ſometimes add a few gramineous roots, berries of various kinds, the ſeeds of the "Strelitzia Reginæ," and the pith of a large palm, to which botaniſts have given the name of Zamia. They rarely kill any of their cattle, unleſs upon particular occaſions. They poſſeſs no other domeſtic animals to yield them food. In the whole Kaffer country they have neither ſheep nor goats, pigs nor poultry. They cultivate no kind of grain nor vegetables on this ſide of the Great Fiſh river, and very little on the other ſide; but the Kaffer tribes more to the weſtward, are very conſiderable horticulturiſts. The commiſſioners, ſent out by the Britiſh government in the year 1801, to endeavour to procure a ſupply of draught oxen, found extenſive fields of a ſpecies of Holcus near the city Leetakoo, the capital of a tribe of Kaffers, called "Booſhooanas," ſituated at the diſtance of 16 days' journey beyond the Orange river, in the direction of north-eaſt from the Cape. The women here, as well as among the eaſtern Kaffers, and indeed in all nations juſt emerged from a ſavage ſtate, went through all the hard labour and drudgery that were required for the ſupport of the family. They not only performed the taſk of breaking up the ground with a kind of hoe made of iron, and afterwards planted it; but they conſtructed their habitations, and collected the materials that were neceſſary. They reaped the grain, cleared it from the huſk, and laid it up in the granaries, which, with other earthen pots and wooden veſſels, were the work of their hands. The men prepare the ſkins and hides which ſerve for ſhoes, and make them up into cloaks for themſelves, their wives and children. They attend alſo the cattle, milk the cows, and hunt the antelopes and other game, with a weapon called the Haſſagai, which is uſed alſo in battle.

Mr. Barrow is of opinion, that the Kaffers were not the aborigines of the ſouthern angle of Africa; but that they might, perhaps, derive their origin from ſome of thoſe wandering tribes of Arabs known by the name of *Bedouins*. Their paſtoral habits and manners, their kind and friendly reception of ſtrangers, their tent-ſhaped houſes, the remains of Iſlamiſm diſcoverable in one of its ſtrongeſt features, the circumciſion of male children, univerſally practiſed among the Kaffer hordes, ſeem to indicate their Arabic origin and their affinity to the Bedouin tribes. Their countenance alſo is Arabic; the colour only differs, which in ſome tribes varies from deep bronze to jet black, but the latter is moſt generally the prevailing colour. Nor is it likely that they owe this colour to their connection with thoſe blacks that are uſually called negroes, as they have no reſemblance, in any part of the body, to the peculiar conformation of this race of human beings. To the Ethiopians or Abyſſinians they have a much cloſer reſemblance. Barrow's Travels in Southern Africa. See CAFFRARIA and DELAGOA *Bay*, under which latter article the reader is requeſted to ſubſtitute Kaffers for Kuffers, a typographical error.

KAFR Errizé, a town of Egypt, on the left bank of the Nile; 18 miles S. of Cairo.

Kafr *el Riſk*, a town of Egypt, on the left bank of the Nile; 3 miles N.E. of Atfieh.

KAGA, a town of Japan, on the N. W. coaſt of Niphon. N. lat. 57° 15′. E. long. 137° 40′.

KAGAN, a town of Ruſſia, between Aſtrachan and the Caſpian ſea; 10 miles S. of Aſtrachan.

KAGEROD, a town of Sweden, in the province of Skone; 12 miles S.E. of Helſingborg.

KAGNAS, a ſmall iſland in the gulf of Bothnia. N. lat. 64° 48′. E. long. 21° 7′.

KAGZEVAN, a town of Aſiatic Turkey, in the government of Erzerum. N. lat. 39° 35′. E. long. 43° 20′.

KAHAKAMAN, a ſmall iſland in the Eaſt Indian ſea, near the N. coaſt of Borneo. N. lat. 7° 21′. E. long. 117° 33′.

KAHEC, a town of Perſia, in Segeſtan; 37 miles S.W. of Dergaſp.

KAHEDE, a town of Africa, on the N. ſide of the Senegal. N. lat. 16° 8′. W. long. 11° 47′.

KAHEM, or Cajem, a town of Aſiatic Turkey, on the Euphrates; 50 miles W.S.W. of Ana.

KAHGON, a town of Bengal; 20 miles S. of Moorſhedabad.

KAHIASSCE, in the Turkiſh court, an officer of ſtate, anſwering to our maſter of the ceremonies.

KAHIRIA, in *Botany*, Forſk. Ægypt. Arab. 153. See Ethulia *conyzoides*.

KAHL, in *Geography*, a town of Germany, on a river of the ſame name, near the Maine; 4 miles S. of Hanau.

KAHLA, a town of Saxony, in the principality of Altenburg, on the Saal; 36 miles W. of Altenburg. N. lat. 50° 48′. E. long. 11° 27′.

KAHOKIA, a poſt-town of America, and chief town of St. Clair county, in the Indiana territory, containing 719 inhabitants.

KAHONE, a town of Africa, in the kingdom of Burſali. N. lat. 13° 56′. W. long. 16 8′.

KAHUN, a town of Perſia, in the province of Kerman; 36 miles S. W. of Sirgian.

KAHUNSILYA, or Kaonsalia, in *Hindoo Hiſtory*, was the wife of Daſaratha, to whom ſhe bore Rama, diſtinguiſhed by the epithet of Chandra, (meaning Lunarian,) from other heroes of the ſame name. See Rama.

KAI, in *Geography*, a town of Ruſſia, in the government of Viatka, on the Kama; 124 miles N.E. of Viatka.

KAJAAGA, or Gallam, as the French call it, a ſmall negro kingdom of Africa, which occupies the extremity of the navigable courſe of the Senegal, terminated in this place by the cataract of F'low. This country is bounded on the N. by the Senegal, on the S.E. by Bambouk, and on the W. by Bondou and Foota Torra. The reſidence of the king is at Maana, within a ſhort diſtance of the ruins of Fort St. Joſeph, where the French had formerly a ſmall factory. The air and climate are, according to Mr. Park, more pure and ſalubrious than at any of the ſettlements towards the coaſt; the face of the country is agreeably interſperſed with hills and vallies, and the windings of the Senegal, which deſcends from the rocky hills of the interior, render the ſcenery on its banks picturesque and beautiful. The natives are called Sera-Woollies, and ſeem to be pure negroes, without any Mooriſh admixture, and are naturally of a mild and docile diſpoſition. With regard to their colour, which is a jet-black, they are not to be diſtinguiſhed from the Jaloffs. They are much addicted to trade, and formerly carried on a conſiderable commerce with the French in gold and ſlaves: they are reckoned tolerably fair and juſt in their dealings, though Mr. Park loſt among them about one-half of his goods and apparel: they are much devoted to the acquiſition of wealth, and they derive conſiderable profit from the ſale of ſalt and cotton cloth in diſtant countries. Their language abounds much in gutturals, and is leſs harmonious than that of the Foulahs; it is, however, well worth acquiring by thoſe who have occaſion to travel through this part of the African continent; as it is very generally underſtood in the kingdoms of Kaſſon, Kaarta, Ludamar, and the northern parts of Bambarra. In all theſe countries the Sera-Woollies are the chief traders.

KAIDA, in *Botany*, Rheede Hort. Mal. v. 2. t. 1—S. See Pandanus.

KAIDERM, in *Geography*, a town of Perſia, in Segeſtan; 90 miles W. of Zareng.—Alſo, a town of Perſia, in the province of Khoraſan; 15 miles E. of Terſhiz.

KAI-FONG, or Cai-fong, a city of the firſt rank in China, the capital of Ho-nan, ſituated at the diſtance of two leagues from the river Hoang-ho. As the river is higher than the city, it is ſubject to inundations, for the prevention of which, ſtrong dykes have been raiſed which extend more than 30 leagues. On occaſion of a ſiege in 1642, by an army conſiſting of 100,000 rebels, the commander of the troops ſent to relieve it determined to drown the enemy by breaking down the large dyke of Hoang-ho; the ſtratagem ſucceeded, the city was overflowed, and 300,000 inhabitants periſhed. It has been rebuilt ſince this calamitous event, but in a ſtyle far inferior to that of its former magnificence. Its juriſdiction comprehends four cities of the ſecond claſs and 30 of the third.

KAIGOL, a town of Perſia, in the province of Khoraſan; 225 miles N. of Herat.

KAIGUEZ, a town of Aſiatic Turkey, on the S. coaſt of Natolia; 18 miles S. of Mogla. N. lat. 36° 50′. E. long. 28° 19′.

KAIGUM, a town of Hindooſtan, in the circar of Aurungabad; 30 miles S.W. of Aurungabad.

KAIHA, a town of Sweden, in the province of Tavaſtland; 60 miles N.N.E. of Jamſio.

KAJIPET, a town of Hindooſtan, in the circar of Cuddapa, on the Pennar; 20 miles S.E. of Cuddapa.

KAILAFUETUEVSKOI, a town of Ruſſia, in the government of Irkutſk, on the Argun; 160 miles S.S.E. of Nertchinſk.

KAILASA. Hindoo mythologiſts have aſſigned different places of reſort or habitation to their different deities: that of Siva is Kailaſa, ſometimes written Cailas, which is deſcribed as one of the three peaks of the wonderful mountain, Meru. (See Meru.) Here the gods, with their conſorts, animated with muſic, dancing, and ambroſia, called by the Hindoos amrita (ſee Kurmavatara), paſs their hours in banquets and happy dalliance, reminding us ſtrongly of the tales of our own claſſics; and appearing indeed to be the ſame ſtories under different names. This ſimilarity occurs in every page of Moor's Hindoo Pantheon, although the author in that work profeſſes to avoid the diſcuſſion of ſuch ſimilarities. (See Kaliya.) The following inſtance, from page 47, will farther illuſtrate this and the preſent article. "The compariſon between Siva and Jove runs parallel in many inſtances. In the capacity of avenger and deſtroyer Jove overthrew the Titans and giants whom Typhon, Briareus, &c. led againſt the god of Olympus, to whom an eagle brought *lightning* and *thunderbolts* during the warfare.

In a ſimilar conteſt between Siva and the Daityas, or children of Diti, who frequently rebelled againſt heaven, Brahma is ſaid to have preſented the god of deſtruction with fiery ſhafts. As the Olympian Jupiter fixed his court and held his councils on a lofty and brilliant mountain, ſo the appropriated ſeat of Mahadeva, whom the Saivas conſider as the chief of the deities, is mount Kailaſa, every ſplinter of whoſe rocks is an ineſtimable gem." Kailaſa is therefore the Olympus of Siva or Mahadeva. See SIVA.

KAIMACHAN, among the Turks. See CAIMACHAN.

KAIMENI, in *Geography*, a ſmall iſland in the Grecian Archipelago. N. lat. 36° 57'. E. long. 23° 26'.

KAIMOO, a town of Africa, in Bambarra, ſeated on the Niger. N. lat. 13° 56'. W. long. 3° 46'.

KAIMOW, a town of Hindooſtan, in Bundelcund; 12 miles N. of Chatterpour.

KAIN, a town of Perſia, in Coheſtan; 60 miles S.S.W. of Herat.

KAINER, a town of Perſian Armenia; 24 miles S.E. of Erivan.

KAINGERSKOI, a ſmall iſland in the North Pacific ocean, near the eaſt coaſt of Kamtſchatka, belonging to Ruſſia. N. lat. 53° 40'. E. long. 160°.

KAINSK, a town of Ruſſia, in the government of Tobolſk, on the Om. N. lat. 56° 55'. E. long. 77° 54'.

KAIRA, a town of Hindooſtan, in Guzerat; 10 miles S.S.W. of Mahmoodabad.

KAIRABAD, a town of Hindooſtan, and capital of a circar in Oude, to which it gives name. The circar is bounded on the N. by Thibet, on the E. by Bahraitch, on the S. by Lucknow, and on the W. by Rohilcund; and is about 80 miles long and from 50 to 76 broad. The town is 86 miles N.W. from Fyzabad. N. lat. 27° 30'. E. long. 81° 8'.

KAISARIEH, anciently *Mazaca* and *Cæſarea of Cappadocia*, a town of Aſiatic Turkey, in the province of Caramania, the capital of a Sangiakat, ſituated at the foot of a mountain, always covered with ſnow, about five or ſix miles in circumference; ſurrounded with walls and defended by a caſtle. This town is well peopled, and in each of the 180 diſtricts to which it is divided, it has a moſque or chapel. The Greeks have two churches, one of which is a Metropolitan, and the Armenians have three. The article which conſtitutes its principal trade is Morocco leather; 250 miles E.S.E. of Conſtantinople. N. lat. 38° 20'. E. long. 35° 18.

KAISENI, a town of Walachia, on the Ardgis; 25 miles N.W. of Buchareſt.

KAISERBERG, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the diſtrict of Colmar. The place contains 2428, and the canton 13,606 inhabitants, on a territory of 125 kiliometres, in 13 communes; 5 miles N.W. of Colmar.

KAISERSBERG, a town of the duchy of Stiria, having a caſtle on a hill; 5 miles S.W. of Leoben.

KAISERSECH, a town of France, in the department of the Rhine and Moſelle, and chief place of a canton, in the diſtrict of Coblentz; 12 miles W. of Coblentz. N. lat. 30° 18'. E. long. 7° 2'. The place contains 435, and the canton 2413 inhabitants, in 16 communes.

KAISERSLAUTERN, a town of France, and principal place of a diſtrict, in the department of Mont Tonnerre; 24 miles N.W. of Landau. N. lat. 49° 27'. E. long. 7° 47'. This town was ceded to France by the elector of Bavaria in 1802. The place contains 2363, and the canton 8640 inhabitants, in 21 communes.

KAI-TON-GI, a town of the iſland of Borneo; 60 miles S.S.E. of Negara.

KAJUC, a town of Aſia, in the country of Kharaſm; 23 miles N.W. of Samarcand.

KAKA-PAKSHA-DHARA, a name of Rama, in Hindoo hiſtory, and of other warriors, who had a habit of ſhaving their heads, leaving only the hair projecting over their ears, which was fancied to reſemble the wings of a crow. The name means *bearing-crow-wings*.

KAKA-TODDALI, in *Botany*, Rheede Hort. Mal. v. 5. 81. t. 41, is *Paullinia aſiatica* of Linnæus, diſtinguiſhed as a new genus by Juſſieu, under the uncouth name of *Toddalia*, and by Schreber under that of *Crantzia*. There having been another genus already given to profeſſor Crantz, Dr. Smith has called that of which we are ſpeaking *Scopolia*, Plant. Ic. under t. 34. See SCOPOLIA.

KAKATOES, in *Ornithology*. See PSITTACUS.

KAKBERG, in *Geography*, a town of Pruſſia, in the Friſch Nerung; 18 miles E.N.E. of Vogelſang.

KAKEGAVA, a town of Japan, in the iſland of Niphon; 95 miles S.W. of Jedo.

KAKELIK, in *Ornithology*, a ſpecies of *Tetrao*; which ſee.

KAKHET, or KAKHETTY, in *Geography*, the eaſtern part of the principality of Georgia, comprehending a part of the ancient Iberia, about 180 miles long and 90 broad. This ſtate, as well as Karduelia, borders northwards on the Kabarda, eaſtwards on Dagheſtan, ſouthwards on the Perſian Armenia, and weſtwards on Immeritia. This ſtate and Karduelia are under the ſole ſovereignty of a prince of the Kakhetian dynaſty. The reſidence is Teflis. The air is ſalubrious, but the country is thinly inhabited. The town Kaket, in this province, is ſituated near mount Caucaſus; 45 miles N N.E. of Teflis. See GEORGIA.

KAKI, a town of Japan, in the iſland of Niphon; 70 miles N. of Meaco.

KAKILAN, a town of Perſia, in the province of Segeſtan; 65 miles N. of Boſt.

KAKILE, in *Botany*, Broter. Luſit. v. 1. 498. See CAKILE, and BUNIAS, ſp. 12.

KAKKABBAN, in *Geography*, an iſland in the Eaſt Indian ſea, being one of the group called "Meratuba;" 40 miles from the E. coaſt of Borneo. N. lat. 2° 8'. E. long. 116° 50'.

KAKKAWATA, one of the Friendly iſlands.

KAKOPIT, in *Ornithology*. See CERTHIA *Amboinenſis*.

KAKOULI, in *Geography*, a town of Turkiſh Armenia; 23 miles E. of Baibourdi.

KAKURI, a town of Japan, in the iſland of Niphon; 85 miles N.E. of Meaco.

KAL, or KALA, in *Hindoo Mythology*, a name of Siva in his character of the *Deſtroyer*, in which he agrees with Saturn or Time, and is called alſo Maha-kala, *maha* being an epithet equivalent to *great*. Kali, or Maha-kali, is a name of his conſort Parvati, in one of her avenging or terrific characters, as ſhe appears in ſeveral of the plates of Moor's Hindoo Pantheon, wherein one of Kal is deſcribed as "Eternity, at the period of Maha-pra-laya, or grand conſummation of all things. In the original he, like his name, is *black*; he holds the roll of fate, and a ſcymitar to execute its deſtructive decrees. He devours man, his own offspring; towns, cities, "the great globe itſelf and all that it inherits"—the univerſe. The great perſonified powers of the Almighty, Brahma, Viſhna, and Siva, "alike await the inevitable doom:" they alſo "fall into the jaws of non-exiſtence." Kala will then, like Saturn, deſtroy himſelf, and nothing will remain but Brahm; the eternal one," p. 30. See KALI, KALPA, and MAHA-KALA.

KALAAT-EL-NEGUER, in *Geography*, a town of Aſiatic Turkey, in the province of Diarbekir; 25 miles S. of Bir.

KALADGIK, a town of Aſiatic Turkey, in Natolia; 8 miles S.E. of Kiangari.

KAL-AGNI-RUDRA, in *Hindoo Mythology*, a name of Siva, or rather three of his names combined. Kal is his name as Time, Agni as Fire, Rudra as Fate. See KAL, SIVA, and RUDRA.

KALANSHEE, in *Geography*, a town of Africa, in the country of Gonjah.

KALANTEKA, in *Hindoo Mythology*, is a name given to Yama, the judge of departed ſouls. (See YAMA.) It means the deſtroyer of Kal, or of Time, and is a perſonification of great boldneſs. See KAL.

KALATOE, in *Geography*, an iſland in the Eaſt Indian ſea, about 30 miles in circuit. S. lat. 7° 18′. E. long. 122° 15′.

KALATU SEFID, a town of Perſia, in Farſiſtan; 10 miles N. of Neubendjan.

KALBA, a town of Perſia, in the province of Mazanderan; 60 miles E. of Fehrabad.

KALBRA, or KELBRA, a town of Germany, in the principality of Schwarzburg-Rudolſtadt, on the Helm; 27 miles N. of Erfurt. N. lat. 51° 28′. E. long. 11° 4′.

KALCKREUTH, a town of Germany, in the territory of Nuremberg; 7 miles N. of Nuremberg.

KALCOBO, a ſmall iſland in the Eaſt Indian ſea. S. lat. 5° 20′. E. long. 117° 39′.

KALDEKIRCHEN, a town of France, in the department of the Roer; 8 miles N.N.E. of Ruremond.

KALDI, GEORGE, in *Biography*, a native of Hungary, was born in Tirnaw about the year 1572, and from his connections he might probably have attained to conſiderable preferment in the church, but he preferred enrolling himſelf in the ſociety of the Jeſuits. He was received into the order at Rome, and returning to his own country, he was baniſhed into Tranſylvania, with the other members of the ſociety, during the commotions which, at that time, agitated the kingdom. After this he diſcharged the duty of theological profeſſor in the univerſity of Olmutz, and filled ſome other important poſts in different places. His laſt retreat was to a college which he built at Preſburg, where he died, in the year 1634, at the age of ſixty-two. He was regarded as one of the moſt eloquent preachers in Hungary. He publiſhed a volume of ſermons at Preſburg in 1631, but he is chiefly celebrated, as an author, for having undertaken and completed a tranſlation of the bible from the Vulgate into the Hungarian tongue, which was printed at Vienna, in 1626.

KALDUROSAN, in *Geography*, a town of Walachia; 10 miles N.N.E. of Buchareſt.

KALE, WILLIAM, in *Biography*, a painter of ſtill life. In the catalogue of the gallery of the Louvre, at Paris, he is called *Kalf*, and there are two exquiſite works of his, uniting the merits of Rembrandt and Teniers. He was born at Amſterdam in 1630, and was a diſciple of Hendrick Pot, a portrait and hiſtorical painter; of whom he learned the practice of the art, but from whom he varied in the application of it; and applied his talents, which were very conſiderable, in a cloſe imitation of objects in ſtill life; which he compoſed with great beauty and effect. He poſſeſſed an eye informed with the power of Rembrandt's arrangements and contraſt of light and ſhade, and a hand, that managed the pencil with the neatneſs and correctneſs of Teniers: his pictures are therefore as agreeable perhaps as it is poſſible for the art to exhibit; when the kind of ſubjects which he choſe are repreſented. He died in 1693.

KALE, in *Botany*, &c. See BORECOLE, BRASSICA, and CRAMBE.

KALE, in *Agriculture*, the common name of a plant of the braſſica kind, which is occaſionally cultivated in the field for the uſe of live ſtock. There are ſeveral varieties of it in cultivation, which are all very hardy in their nature, riſe to a conſiderable height in the ſtem, and afford a large proportion of green food per acre. They are an excellent ſheep feed in the early ſpring months, as March and April, throwing out freſh ſprouts as the old ones become removed. The bite of ſheep is not by any means injurious to them; and they are capable of being fed off without hurdling, which is a very conſiderable advantage in moſt ſituations. See BORECOLE and BRASSICA.

KALE, in *Gardening*, the common name of a hardy tall growing plant of the cabbage kind; of which there are ſeveral varieties cultivated in gardens for winter and ſpring uſe, but the curled ſorts are probably the beſt for the table. They are capable of being had recourſe to for a conſiderable length of time, as they throw out ſprouts in great abundance, and are ready in thoſe ſevere parts of the winter ſeaſon when but few other greens can be procured, eſpecially in the more northern parts of the iſland. See BRASSICA and BORECOLE.

KALENBERG, in *Geography*, a general name given to a ridge of Auſtrian mountains, extending from near the ſource of the river Save, towards the Danube, about 9 Britiſh miles on the weſt of Vienna, where it is called Leopoldſberg; and ſuppoſed by Buſching to be the ancient Cetius. This ridge of Kalenberg was the weſtern boundary of Germany till about the year 1040, when it was removed E. to the river Leitha.

KALENDAR. See CALENDAR.

KALENDERI, in *Hindoo Mythology*, a daughter of Surya, or the Sun; ſpoken of alſo as a water nymph. She is one of the eight wives of *Kriſhna*, which ſee.

KALENDS. See CALENDS.

KALF, in *Geography*, a town of Sweden, in Weſt Gothland; 45 miles S. E. of Gotheborg.

KALFSKAR, a ſmall iſland on the eaſt ſide of the gulf of Bothnia. N. lat. 63° 34′. E. long. 20° 53′.

KALFVEN, a ſmall iſland on the weſt ſide of the gulf of Bothnia. N. lat. 61° 3′. E. long. 17° 7′.

KALGAGICHA, a town of Ruſſia, in the government of Archangel; 40 miles S.S.W. of Oneg.

KALGAPOL, a town of Hindooſtan, in Dowlatabad, on the Beemah; 12 miles S.W. of Naldourouk.

KALGUEV, an iſland in the Frozen ſea, about 140 miles in circuit; 240 miles N.N.E. of Archangel. N. lat. 68° 20′ to 69° 18′. E. long. 45° 30′ to 47° 30′.

KALHAT, CALHAT, or *Calajate*, a town of Arabia, in the province of Oman, at the mouth of a river of the ſame name, which runs into the Arabian gulf; 80 miles S.E. of Maſkat. N. lat. 23° 10′. E. long. 58° 25′.

KALHAT, *Cape*, or *Ras Kalhat*, a cape on the E. coaſt of Arabia. N. lat. 23° 18′. E. long. 58° 30′.

KALI, in *Agriculture*, the common name of a plant of the ſea kind, which affords a ſaline matter by incineration, which, in many ſorts of ſoil, is employed with great advantage as a manure, in combination with other ſubſtances. See QUERCUS *Marina*, and SEA-WEED.

KALI, in *Botany*, Tourn. Inſt. 247. t. 128, an Arabic name. (See SALSOLA.) The ſame appellation has been given to various ſucculent alkaleſcent plants.

KALI, in *Chemiſtry*. See CARBONAT *of Potaſh*, and ALKALI.

Kali, in the *Materia Medica.* See Salsola and Soda, and alſo Alkaline.

Kali, in *Hindoo Mythology*, a name and form of the goddeſs Parvati, conſort of Siva, in his character of *Kal* or *Time*, which ſee. Under this name and form ſhe is of a terrific appearance, and is thus deſcribed in Moor's Hindoo Pantheon, p. 151. "Maha-kali, or the Great Kali, black and dreadful, is encompaſſed by ſymbols of deſtruction: two of her hands ſeem employed in the work of death: of the other two, one appears pointing downwards, alluding to the univerſal havoc which ſurrounds her, while the other, pointing upwards, ſeems to promiſe the reſurrection of nature by a new creation. She is repreſented without a creſcent (the artificial meaſure of time), becauſe it is unneceſſary to her character as the hieroglyphic of eternity; but the belief of the Hindoos in ſucceſſive deſtructions and renovations of the univerſe (ſee Kalpa), accounts for her wearing a *mund mala*, or necklace of ſkulls, as emblems of thoſe revolutions." In that work are many plates of this deity under various names, including Bhadra-kali, as well as Maha-kali. Kali is the Hindoo name of the Nile, in the vicinity of which the ſcene of ſome of the Puranas is laid; and they relate, indeed, that the river itſelf is but a transformation of Kali, which, in Sanſcrit and other Indian languages, means *black*; as does Nila, another of her names, or rather *dark blue*: the following alſo are names of this multiform deity, and have a like meaning; Aſita, Shyama, or Shyamala, Mekara, Anjanabha, Kriſhna. (Ibid. p. 155.) Other plates in the ſame work, repreſenting the goddeſs, are thus deſcribed: "Plate 27. is taken from a braſs caſt depoſited by the author in the muſeum at the India-houſe: it is eighteen inches high, including the pedeſtal, which is about a foot in diameter, ſix inches deep and hollow, as if intended to be fixed on ſomething; and I was told ſuch images are occaſionally faſtened on the top of the *rat'h*, a carriage dragged about the ſtreets on certain feſtivals. Kali is ſaid to aſſume this form to frighten ſinners into repentance and virtue: her attitude ſeems a chacing one, aſſumed to cauſe immediate terror; her limbs bend; her hands are open, fingers lengthened into points, ſtretched out; a ſerpent forms her girdle; ſhe is naked, except a ſcanty cloth, called *pira*, round her middle; her belly is empty, thin, and ſhrivelled; her breaſts pendent, with long diſguſting nipples; a ſerpent convolves round her neck, and, twining on her boſom, projects its head to ſupport her protruded, long, rough tongue: her chin is peaked; immenſe teeth and tuſks are fixed in her lipleſs gums; her noſtrils and goggle eyes are diſtended and bloated; ſnakes form appropriate rings for her naſty ears, being knotted in the pendent lobes, with their heads raiſed, and their hoods expanded; her hair is ſtiffened out, forming a frightful glory round her head, diverging to meet a wider glory that riſes from a flower on each ſide, forming a ſupport to the figure. The caſt is of braſs; and, however diſguſting to the eye, is far from being devoid of merit: our engraving is taken from an exact portrait, and exhibits conſiderable expreſſion." P. 159.

"Plate 28. is from a very fine bronze image, about a foot high, caſt, I was informed, in the Carnatic. It was preſented to me by a Brahman, and is, I think, on the whole, the moſt elegant and beſt finiſhed figure in my poſſeſſion. She is, in this form, called Bhadra-kali, Mahakali, and by other names; alſo, being eight-handed, Aſhtabuja. Two of her hands are empty, pointing upward and downward, in the poſition before noticed: one of her right hands holds ſomething not unlike a caduceus, which, in the caſt, it reſembles more nearly than in the plate; its correſponding left hand the *Patra* (ſee Patra) or cup: the next right and left hands, a ſingular crooked ſword, and a ſhield with an emboſſed flower or fruit: the ſuperior right hand has an agricultural implement, called *nanga*; the left the cord *pas*, or *paſh* (ſee Pash), to catch or ſtrangle ſinners with. Her fine perſon is full dreſſed, with a profuſion of ornaments; between her full breaſts a five-headed ſerpent uprears itſelf; ſhe has a necklace of human heads; her eardrops are elephants; and a row of ſnakes' heads peep over her coronet. Her forehead is marked either with Siva's third eye (ſee Virupaksha), or her own hieroglyphic; and her open mouth ſhews her teeth and tuſks, giving her a fierce and threatening aſpect." P. 160.

KALININA, in *Geography*, a town of Ruſſia, in the government of Tobolſk, on the Tunguſka. N. lat. 60° 56'. E. long. 106° 26'.

KALIPH. See Caliph.

KALISCH, or Kalitz, in *Geography*, a city in the duchy of Warſaw, late the capital of a palatinate of the ſame name in Great Poland, or Weſtern Pruſſia, ſituated on the Proſna, and ſurrounded with walls, towers, and moraſſes. This palatinate was alſo called the "palatinate of Gneſen," from the city of that name; 57 miles N.E. of Breſlau. N lat. 51° 50'. E. long. 18°. See Gnesen.

KALITVA, a town and diſtrict of Ruſſia, in the government of Voronetz, ſituated on the rivulet Kalitva; which falls into the Don; 60 miles S.S.E. of Voronetz.

KALITVENSKAIA, a town of Ruſſia, in the country of the Coſſacks, ſeated on the Donetz.

KALIYA, or Kalanaga, in *Hindoo Mythology*, a ſerpent ſlain by Kriſhna, who, being the Sun, correſponds in this, and many other inſtances, with Apollo, the ſlayer of Python, both of whom, according to Clemens, were adored at Delphi; and in like manner both Kriſhna and Kaliya find adorers in India, where, in honour of Kriſhna's triumph, games and ſports are annually held, as the Pythic games were at ſtated times in Greece. Like the Pythian ſerpent in the temples of Apollo, Kaliya-naga enjoys alſo his apotheoſis in thoſe dedicated to Kriſhna; nor, ſays major Moor, in his Hindoo Pantheon, whence we have taken this article, "are arguments wanting toward identifying Serpentarius on our ſphere with his formidable foe, and the theatre of the conflict, the river Yamuna, or Jumna, with the via lactea. So the variety of demons ſent to annoy Kriſhna, are, perhaps, the allegorical monſters of the ſky, attempting in vain to obſtruct his apparent progreſs through the heavens, where other conſtellations are fabled as ſo many beautiful nymphs ready to receive him, and have given riſe to allegories of his inconſtancy." (See Krishna.) Other names of this mighty mythological ſerpent are, *Naga*, *Seſha*, and *Vaſcky*, which ſee.

KALIYANA-RAYA, a name of Viſhnu among the Hindoos, of whom there is, under this name, a ſtatue at Barra, on the banks of the Euphrates, which is ſaid to be carefully concealed from the ſight of the Mahometans.

KALKA, or Kalka-pira, in *Geography*, a river of Chineſe Tartary, which, though one of the ſmalleſt, gives name to the *Kalkas*. It riſes in a famous mountain, called Suelki, or Siolki, which name may be applied to the ridge that ſeparates the Kalkas from Chineſe Daouria, and which is 130 miles W. diſtant from Tcitcicar. This river empties itſelf into the lake Coulan.

KALKALLY, a town of Hindooſtan, in Dowlatabad; 20 miles E. of Nander.

KALKAS, a tribe of Tartars, conſiſting formerly of more than ſix hundred thouſand families, which inhabit the country that lies N. of the Mogul Tartars. Their country, which ſtretches as far as the kingdom of the "Eleuthes," is near 300 leagues in extent from eaſt to weſt. In this region was anciently ſituated, towards the 45th degree of N. latitude, the city of "Karakan;"—the ſeat of the empire of Tſchinghis-kan, and of that of his ſucceſſors. The Kalkas live in tents along the banks of the rivers which water their country; of which the principal, though they take their name from Kalka-pira, are the Kerlon, Toula, Touy, and Salingué. The banks of theſe rivers are well inhabited, and they flow through extenſive plains, which are covered with rich paſtures: their waters are very wholeſome, and abound with excellent fiſh, eſpecially trout. The vaſt deſert, called "Cobi," (which ſee,) occupies almoſt the whole ſouthern part of the country of the Kalkas. The war which the king of the "Eleuthes" (ſee Kalmuks) carried on in 1688 againſt the Kalkas almoſt deſtroyed the whole nation. To avoid the purſuit of a ſuperior enemy, they ſupplicated the aſſiſtance of the Chineſe arms, and offered to ſubmit to the empire. Kang-hi undertook their defence, conquered the king of the Eleuthes, and kept the Kalka Tartars under his dominion, after having conferred upon their princes different titles of honour.

KALKA-TARGAR, a country of Chineſe Tartary, which contains one claſs of Mongul Tartars. N. lat. 41° 50′. E. long. 110° 33′.

KALKE, one of the Prince's iſlands, in the ſea of Marmora; anciently called "Chalcitis," on account of its mines of copper, which have been long neglected. On this iſland are three large Greek monaſteries.

KALKI, in *Hindoo Mythology*, is the name given to an expected *avatara*, or manifeſtation of the god Viſhnu. (See Vishnu.) The incarnations of this deity are numerous; but ten of them are of more importance than the others, and are, for diſtinction, called the ten incarnations, *das-avatara*. Of theſe nine are paſt; in the tenth, or Kalki, Viſhnu is to appear mounted on a white horſe, with a drawn ſcymitar, blazing like a comet, to end the kali-yug, that is, the preſent, or iron age, preparatory to a renovation of the world with an era of purity, or ſatya-yug. (See Yug.) In pictures, this avatara is repreſented by a man leading a white-winged horſe. It is alſo called kalenki and aſwah; likewiſe ſaid to mean a horſe; but as kal is time, and in ſeveral dialects means both yeſterday and to-morrow; or, more extenſively, the paſt and future, it is ſurmiſed by the author of the Hindoo Pantheon, p. 188. that the name of kalki, applied to this ender and renovator of ages, may have ſome alluſion to that idea, rather than be confined to the form in which he is to be manifeſted. See Kal and Kalpa.

KALKISSEE, in *Geography*, a town of the iſland of Ceylon; 19 miles S. of Columbo.

KALKOON, or Turkey Islands, a cluſter of ſmall iſlands in the Eaſt Indian ſea. N. lat. 6° 15′. E. long. 115° 45′.

KALL, a town of Sweden, in Jamtland; 42 miles N.W. of Oſterſund.

KALLA, a ſmall iſland on the eaſt ſide of the gulf of Bothnia. N. lat. 64° 20′. E. long. 23° 26′.

KALLATMA, a town of Egypt; 15 miles N. of Coſſeir.

KALLERY, a town of Sweden, in the province of Smaland; 28 miles S.S.W. of Jonkioping.

KALLODRA, a town of Hindooſtan, in Guzerat; 16 miles N. of Surat.

KALLSKAR, a ſmall iſland in the N. part of the gulf of Bothnia. N. lat. 65° 43′. E. long. 23° 36′.—Alſo, a ſmall iſland on the E. ſide of the ſame gulf. N. lat. 63° 56′. E. long. 22° 43′.—Alſo, another ſmall iſland on the ſide of the gulf. N. lat. 63° 50′. E. long. 22° 33′.—Alſo, another ſmall iſland on the ſame ſide of the gulf. N. lat. 63° 26′. E. long. 21° 28′.

KALLVIKEN, a ſmall iſland in the N. part of the gulf of Bothnia. N. lat. 64° 18′. E. long. 21° 7′.

KALM, Peter, in *Biography*, a very celebrated naturaliſt, and pupil of Linnæus, the account of whoſe travels, from having been tranſlated into Engliſh, is well known in this country. He was a native of Finland, and was born in the year 1715. Having imbibed a taſte for the ſtudy of natural hiſtory, it appears that he purſued his inclination with much zeal and induſtry. His firſt reſearches were rewarded by the diſcovery of many new plants in Sweden, of which he gave ſome account to the botanical world between the years 1742 and 1746. He was particularly anxious to explore the virtues of plants, both with reſpect to their uſes in medicine, and in the uſeful arts, ſo that planting and agriculture occupied ſome portion of his attention. His reputation as a naturaliſt cauſed him to be appointed profeſſor at Abo, and in October 1747, he ſet out upon his travels, ſailing from Gottenburg for America; but on account of a violent hurricane was obliged to take ſhelter in a port of Norway, whence he could not depart till the enſuing February, when he proceeded immediately for London. From hence he went to North America, as we learn from his book; and having ſpent two or three years in exploring whatever was worthy of obſervation in that country, he returned to his profeſſorſhip at Abo in 1751. The expences of this undertaking appear to have exceeded what was allowed him by the Academy of Sciences, ſo that our author was obliged to live rather penuriouſly upon his return. Yet we are informed that he found means to cultivate, in a ſmall garden of his own, ſeveral hundred plants, for the uſe of the univerſity, as there was no public botanical garden at Abo. "His diſcoveries in botany very materially enriched the *Species Plantarum* of his great maſter, and the Linnæan Herbarium abounds with ſpecimens brought home by him, diſtinguiſhed by the letter K." Haller enumerates a long liſt of tracts publiſhed by Kalm, and his inaugural diſſertation appeared in the *Amœnitates Academicæ* of Linnæus. He was originally intended for the eccleſiaſtical profeſſion, but was drawn aſide from this purſuit by attending the lectures of Linnæus on natural hiſtory, given in the univerſity of Upſal. Indeed, it was through the recommendation of Linnæus that profeſſor Kalm was fixed upon to undertake the voyage to North America. He afterwards made, at his own expence, a very extenſive tour into Ruſſia, the hiſtory of which never appeared in print, but which is ſuppoſed to have furniſhed conſiderable matter for the work of a Swediſh writer, who publiſhed a book of travels in that kingdom. Kalm was a member of the Royal Swediſh Academy of Sciences, and departed this life in the year 1770, aged 64. His collection of dried plants, made in his various journies, and doubtleſs valuable for the purpoſes of botanical information, is ſaid to remain in the hands of his family in a ſtate of neglect. Hall. Bibl. Bot. Aikin. Gen. Biogr.

KALMIA, in *Botany*, a genus named by Linnæus in honour of his friend and pupil Peter Kalm, D.D. profeſſor of Economy at the univerſity of Abo. (See Kalm.) Linn. Gen. 217. Schreb. 293. Willd. Sp. Pl. v. 2. 600. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 64. Juſſ. 158. Lamarck Dict. v. 3. 345. Illuſtr. t. 363. Gærtn. t. 63.—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Bicornes*, Linn. *Rhododendra*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, ſmall, permanent, divided into five, ſubovate, acute, roundiſh ſegments. *Cor.* of one petal, ſalver or funnel-ſhaped; tube cylindrical, longer than the calyx ; limb with a flat diſk, the margin upright, five-cleft half way down ; ten little horn-like cells projecting outwardly from the corolla, and ſurrounding it where the border is upright. *Stam.* Filaments ten, awl-ſhaped, ſlightly ſpreading, a little ſhorter than the corolla, at whoſe baſe they are inſerted ; anthers with two pores. *Piſt.* Germen ſuperior, roundiſh, furrowed, ſtyle thread-ſhaped, longer than the corolla, declining ; ſtigma obtuſe. *Peric.* Capſule ſomewhat globoſe, depreſſed, five-celled and five-valved. *Seeds* numerous.

Eſſ. Ch. Calyx in five deep ſegments. Corolla cup-ſhaped, with ten prominences. Anthers with two pores. Capſule with five cells.

1. *K. latifolia.* Broad-leaved Kalmia. Linn. Sp. Pl. 560. Curt. Mag. t. 175. Sm. Inſ. of Georgia, t. 37.—“ Leaves ovate-elliptical, ternate and ſcattered. Corymbs terminal.”—Profeſſor Kalm relates that he found this ſpecies in various parts of North America, and eſpecially in the province of Pennſylvania, on the ſides of hills, and occaſionally in woods, which were enlivened by its foliage when moſt other trees had loſt their verdure. It was covered with a profuſion of beautiful bloſſoms in the month of May.—*Stem* 10 or 12 feet high, branched. *Leaves* rigid, bright green above, pale beneath, on ſhort footſtalks. *Flowers* in a round bunch, ſitting very cloſe to the branch, of a pale bluſh-colour, variegated beautifully with crimſon.

2. *K. anguſtifolia.* Narrow-leaved Kalmia. Linn. Sp. Pl. 561. Curt. Mag. t. 331.—“ Leaves lanceolate. Corymbs lateral.”—A native alſo of North America, flowering from May to July.—*Stem* from three to ſix feet high, divided into ſmall woody *branches*, covered with a dark grey *bark*. *Leaves* of a ſhining green colour above, paler beneath, obtuſe, on ſhort footſtalks, placed without order, varying in breadth. *Flowers* in looſe, lateral bunches, of a bright red colour when they firſt open, but afterwards fading to a bluſh or peach-colour.—There are two varieties of this ſpecies mentioned in the *Hortus Kewenſis*, one with red, the other with pale flowers.

3. *K. glauca.* Glaucous Kalmia. Willd. n. 3. Curt. Mag. t. 177. Ait. Hort. Kew. v. 2. 64. t. 8.—“ Leaves oppoſite, oblong, ſmoothiſh, glaucous underneath, revolute at the margin. Corymbs terminal. The little branches two-edged.”—Diſcovered by ſir Joſeph Banks at Newfoundland, and introduced into this country in 1767. It flowers in April and May.—This *ſhrub* is about two feet in height. *Stems* branched, round, reddiſh-brown. *Leaves* embracing the ſtem, each furniſhed with a broad, longitudinal, yellowiſh rib. *Flowers* on very long ſtalks, about five or ſix in a bunch, of a beautiful pink or roſe-colour.—It much reſembles *latifolia* in habit, but is conſiderably ſmaller, and of more humble growth.

4. *K. hirſuta.* Hairy Kalmia. Willd. n. 4. Curt. Mag. t. 138.—“ Leaves oppoſite and alternate, elliptical, hairy. Flower-ſtalks axillary, ſingle flowered.”—A native of South Carolina, in a ſwampy ſoil. It flowers in the autumn.—*Stem* upright, ſlender, about three feet in height, branched. *Leaves* ſmall, bright-green, numerous. *Flowers* purpliſh, axillary, each growing on a ſingle ſtalk, though inaccurately deſcribed by Curtis and Martyn as being racemoſe. The general appearance of this ſpecies is ſomewhat ſimilar to that of *Andromeda Daboecii*.

This whole genus is remarkable for its elegant flowers and foliage. It thrives well in a boggy ſoil, and is a general favourite in all gardens.

KALMIA, in *Gardening*, comprehends plants of the hardy evergreen ſhrubby kinds ; of which the ſpecies moſtly cultivated are, the broad-leaved kalmia (K. latifolia) ; the narrow-leaved kalmia (K. anguſtifolia) ; the glaucous kalmia (K. glauca) ; and the hairy kalmia (K. hirſuta).

The value of the firſt ſort, which is an elegant ſhrubby plant, is much leſſened by its noxious properties.

In the ſecond kind, there are varieties, with pale and deep red flowers, differing in their habit ; the latter, the moſt humble of the two, not only produces the moſt brilliant flowers, but in greater abundance. This is ſaid to be poiſonous to ſheep and cattle in its native ſituation, America.

Method of Culture.—Theſe different plants are capable of being increaſed by ſeeds, layers, and ſuckers from the roots. But the firſt ſort is moſt commonly raiſed from the ſeeds, which are procured from America, and ſown in pots or boxes filled with light ſandy mould, in the ſpring ſeaſon, and plunged in an eaſterly border, or in beds of light mould, in the ſame aſpect. However, when placed in a gentle hot-bed they ſucceed much better. They muſt, notwithſtanding, be inured to the full air of the atmoſphere during the ſummer ſeaſon, having ſhelter in the winter from froſt. As ſoon as the plants have had two years growth, they may be removed into ſeparate pots, in order to be continued two years longer or more ; when they may be planted out where they are to remain, in warm ſituations in the open ground.

The ſecond ſpecies is moſtly increaſed by layers, which ſhould be made from the young ſhoots, and laid down in the early autumn. In a year or two, when they are become well rooted, they may be taken off, and planted ſeparately in pots filled with bog earth, or in a warm border formed of the ſame ſort of ſoil. This is a more hardy kind than the former.

The third kind is moſtly increaſed in the ſame manner as the firſt, and demands a ſimilar method of treatment.

The fourth is capable of being raiſed from layers, but the plants are preſerved with difficulty in this climate.

Almoſt all the plants are likewiſe capable of being increaſed by ſuckers ; which ſhould be taken off, and planted out in the ſpring, in nurſery rows, for two or three years, after which they may be removed to the places where they are to grow.

In the more hardy ſorts, theſe plants afford ornament and variety, when properly placed in the fronts of clumps and ſhrubbery borders ; and in thoſe which are tender, in mixture with other potted, green-houſe, and other ſimilar plants.

KALMOUA, in *Geography*, a town of Pruſſia, in the circle of Natangen ; 12 miles S.S.E. of Marggrabowa.

KALMUCKS, OELOETS, or *Eleuthes*, a tribe of Tartars, who affirm their home to have been between the Kokonor or Blue lake, and Thibet. Long before Tſchingis-khan, according to the old reports of theſe people, the greateſt and mightieſt part of the Oeloets made a military expedition weſtward as far as the Leſſer Aſia, and there loſt themſelves among the mountains of Caucaſus ; but the reſt, who had ſtaid behind in Great Tartary, received from their Tartarian neighbours, the name Khalimak (the ſeparated). In fact they call themſelves alſo Khalmik, though Oeloet is always their peculiar denomination, which word likewiſe denotes a ſeparated, disjoined, or diſtinct nation. The Oeloets divide themſelves, at leaſt ſince the deſtruction of the Mongolian monarchy, into four main ſhoots, who denominate themſelves Khoſchot, Derbet, Soongarr, and Torgot ; and from the time of their ſeparation from the Mongoles or Monguls, they have been uniformly ſubjected to various princely families. The major part of the “ Koſchotan” Kalmucks are ſaid to have remained in and about Thibet and on the Kokonor, and after the downfal of the Soongarian power they have been under the protection of the Chineſe. The ſmaller part of this ſtock had long before withdrawn to the banks of the Irtiſh, and at length fell under the dominion of the Soongarian horde, with which it took part in the wars againſt China, and was alſo diſperſed at the ſame time with the Soongarians. Thoſe under the Chineſe ſovereignty, the ſtill united horde of the Khoſchotes, are eſtimated at 50,000 heads. They are reported to have had their name, which implies warrior or hero, from the courage they diſplayed under Tſchingis; and from this circumſtance, as well as their deriving their princely race in uninterrupted ſucceſſion from the brother of the great Tſchingis, they maintain a ſuperiority of rank above the other Kalmuck hordes. The number of Khoſchotes ſubject to Ruſſia is but ſmall. In the year 1675 there came 1500, and in 1759 an additional 300 families to the ſhores of the Volga, where they ſettled and voluntarily ſubmitted to the Ruſſian ſovereignty. The "Soongares," at the ſeparation of the Mongolian monarchy, formed but one ſtock with the Derbetans, who afterwards parted, under two diſcordant branches of their princely family. This horde, in the 17th and beginning of the 18th century, reduced to their ſubjection a great part of the other Kalmuck races, particularly the Khoſchot, Derbet, and Kho-it, and waged bloody wars with the Mongoles as well as with the Chineſe empire itſelf, but which ended in their total ſubjugation and diſperſion. Previouſly to this unhappy period, they, together with the Derbets, reckoned upwards of 50,000 fighting men, and were deemed the braveſt, richeſt, and moſt powerful horde. They reſided formerly about the Balkhaſh lake and its rivers Tſchuy and Ily; and their moſt flouriſhing period was between the years 1696 and 1746. The towns of the eaſtern Bucharia and the Great Kirghiſe horde were about this time tributary to them. Many of the Soongarians diſperſed themſelves in the interior parts of Aſia and quite into the Uſbeck towns; ſome thouſands of them fled into Siberia; and moſt of them accommodated themſelves to the Chineſe ſovereignty, and, from their own ſtatements, it appears, that ſcarcely 20,000 families of them and the Derbetan nation are now remaining. The number of the Soongares, who at that time (1758) took refuge in Ruſſia, amounted to about 20,000 heads; they were united with the Volgaic Kalmucks, but for the moſt part returned with them again in the year 1770 into the Soongarèy. The "Derbetans," who at firſt had their paſturages in the region of the Koko-noor, removed thence, on account of the Mongolian diſturbances, towards the Irtiſh, and, on that occaſion, ſplit into two parties. One of them united with the Soongares, in whoſe fortunes and final diſſolution it was involved; and the other proceeded weſtward with the Torgots towards the Yaik (now Ural) as far as the Volga and the Don, where it completely ſettled. In 1723 they removed to the parts beyond the Don; and afterwards joined the Torgots on the Volga. The "Torgots" ſeem to have formed themſelves into a particular horde much later than the other Kalmuck branches. Removing from the reſtleſs Soongares, they marched weſtward to the Steppes on the Volga, and there ſettled, receiving from the Ruſſians the appellation of the Volgaic Kalmucks. In the year 1761 the Ruſſian government came to an agreement with this rich and powerful horde, which reſtricted the authority of the khan to narrower bounds, and excited ſuch diſcontents, that they returned in great numbers in 1770 and 1771, over the ice of the river Ural, acroſs the Kirghiſian Steppe, into the Soongarey. The whole amount of the Kalmucks that remained in Ruſſia was eſtimated, ſome few years ago, at ſomewhat more than 20,000 tents. Theſe are the remains of all the four hordes; but the Khoſchotes, the Soongares, and Torgots, who remained and are diſtributed among the Derbets, have, beſides ſeveral petty princes, a khan preſiding over them. They wander, with their flocks and herds, in the ſteppes between the Don and the Volga, from the line of Tzaritzin as far as Caucaſus; and between the Volga and the river Ural, from the Irghis quite to the Caſpian; that is, in the governments of Saratof and Aſtrachan, and in the ſeats of the Coſſacks of the Don. In addition to theſe there is ſtill a numerous colony of "baptized Kalmucks." Towards the cloſe of the 17th century, many, among the diſtinguiſhed and noble, profeſſed themſelves of the Chriſtian faith. In the year 1737 the government eſtabliſhed them in a fruitful region about the rivers Samara, Sok, and Tok (in the preſent government of Simbirſk and in the Orenburg diſtrict of the government of Ufa), and granted them alſo the city of Stavropol, which is now a chief town of the government of Simbirſk. The increaſe of this colony was ſo conſiderable, that in the year 1771 they could reckon nearly 14,000 heads, whereas in 1754 they were only 8695. There is yet ſubſiſting in the government of Ufa a ſmall colony of "Mohammedan Kalmucks," which originated from individual proſelytes made by the Kirghiſes and adopted by that body.

The Chineſe empire has been lately extended in Tartary by the celebrated conqueſt of the kingdom of the Eleuthes, made in 1759 by the arms of the emperor "Kien-Long," who had been 46 years on the throne of China. The whole nation of the Eleuthes, known in Europe and Ruſſia by the name of Kalmucks, may be divided (ſays Groſier) into three branches, which have all proceeded from the ſame ſtem. The moſt weſterly (now the moſt numerous and powerful) occupy the country contained between the Caſpian ſea, Muſcovy, Samarcand, and Caſhgar, and which extends towards the eaſt as far as a vaſt chain of mountains, ſuppoſed to be a continuation of Caucaſus. Every year during winter theſe Tartars encamp on the ſhore of the Caſpian ſea, near Aſtrachan, where they carry on a great trade. The ſecond diviſion of the Eleuthes inhabit to the eaſt, from the chain of mountains now mentioned, as far as another chain of lofty mountains, the moſt conſiderable of which are called "Altai," in which are the ſources of the Oby and Irtiſh. The country which theſe people inhabit is very extenſive; ſince it borders on the north with Muſcovy, and on the ſouth with the territories of the Uſbeck Tartars; theſe are the people whom Kien-Long has conſtrained to ſubmit to the Chineſe government. The third branch of the Eleuthes inhabit to the weſt of China; they are the Tartars of Kokonor, who have been for a long time ſubjects of the empire. They are ſeparated from the province of Chen-ſi by lofty mountains. They take their name from a lake in this country, called in their language "Kokonor," and which is one of the largeſt in Tartary. They are ſubject to eight princes, who are independent of each other, and who are all of the race of the khan of the Eleuthes Tartars. Theſe people derive their principal riches from the gold which is found mixed with the ſand of their rivers, and above all with that of "Altangkol," or the Golden river. The gold-duſt which it furniſhes is the principal revenue of the princes of Kokonor, who employ their vaſſals during ſummer in collecting it. One of the principal articles of the trade of Kokonor is a kind of napped woollen ſtuff, called "pou-lou;" it is manufactured by theſe Tartars, who have the art of dyeing it in different colours; long dreſſes are made of it in the country, and it is generally uſed at Pe-king for covering ſeats. The famous Hoang-ho, or the Yellow river, has its ſource in this corner of Tartary.

The Kalmucks of Aſiatic Ruſſia are divided into three ranks; the nobility, whom they call white bones; the common people, who are bondmen, and denominated black bones; and the clergy, deſcending from both, who are free. In like manner, the noble ladies are called white fleſh; and the common women black fleſh; but pedigrees are only reckoned by the bones. The power of the "Taidſha," or chief prince, conſiſts ſolely in the number and opulence of his ſubjects; territory being of no eſtimation in ſo wide a region. Theſe ſubjects form an "Oluſs," divided into "Imaks," from 150 to 300 families; each Imak being commanded by a "Saiſſan," or noble. If there be a great khan, or emperor, the princes are only guided by him in affairs of general importance. The tribute is about a tenth part of the cattle, and other property; but on the firſt ſummons every man muſt appear on horſeback before the prince, who diſmiſſes thoſe who are unfit for the fatigues of war. The weapons are bows, lances, and ſabres, and ſometimes fire-arms; and the rich warriors are clothed in mail of interwoven rings, like that uſed in Europe till the 15th century. But they cannot oppoſe regular armies, and are apt even to diſorder that of their allies. Tooke's View of the Ruſſian Empire, vol. i. Groſier's China, vol. i.

KALMUNZ, a town of Bavaria, in the principality of Neuburg, at the conflux of the Vilz and the Nab; 12 miles N.N.W. of Ratiſbon.

KALNICK, a town of Ruſſian Poland, in the palatinate of Braclaw; 16 miles E.N.E. of Braclaw.

KALO, a town of Hungary, fortified with a moat and baſtions; 21 miles S.E. of Tokay.

KALOMBA, a town on the N. coaſt of the iſland Cumbava. S. lat. 8° 9'. E. long. 118°.

KALOUKE, a town on the W. coaſt of the iſland Celebes. S. lat. 2° 11'. E. long. 119° 15'.

KALPA, in *Hindoo Chronology*, an imaginary period, at the end of which all things are abſorbed in the Deity; it ſeems to mean a creation or formation. "The Hindoos ſay that it has been revealed, that from the beginning to the end of things, when the whole creation will be annihilated and abſorbed into the Supreme Being, there will be five great kalpas, or periods. We are now in the middle of the fourth kalpa, fifty years of Brahma being elapſed, and of the remainder the firſt kalpa is begun. Theſe five great kalpas include five hundred years of Brahma, at the end of which nothing will remain but Brahm, or the Self-exiſting. Every kalpa, except the firſt, is preceded by a renovation of the world, and a general flood. Theſe five kalpas have five deities, who rule by turns; and from whom the kalpas are denominated. Theſe five deities are Devi (or Parvati), Surya or the Sun, Ganeſa, Viſhnu, and Iſwara or Siva. Brahma has no particular kalpa: he is intimate to them all. Each deity, in his own period, is called Kalſva-rupi, meaning with the *countenance* of Kal, or Time; or Chronus, as weſtern mythologiſts would ſay; they having ſeveral ruling deities of that name. We are now under the reign of the fourth, Chronus, or in the kalpa of Viſhnu; who to *create*, thought on Brahma to *preſerve*; he foſters the whole creation in his own character, and he will ultimately *deſtroy* it through the intervention of Rudra, or Siva. It is declared in the Puranas, that all animals and plants are the linga or phallus of the preſiding Kalſva-rupi deity, and that at the end of his own kalpa, he is deprived of his ling by his ſucceſſor, who attracts the whole creation to himſelf, to ſwallow it up, or devour it, according to weſtern mythologiſts; and at the end of his kalpa he diſgorges the whole creation. Such is the origin of Chronus devouring his own offspring; of Jupiter diſgorging it, through a potion adminiſtered to him by Metis, and of Chronus caſtrating his own father." Moor's Hindoo Pantheon. (See Kal.) We ſhall extract no farther on this abſtruſe point of Hindoo metaphyſics, in the conſideration of which great difficulties are neceſſarily interpoſed.

KALPA-DRUMA, the name given by Hindoo fabuliſts to a tree, ſituated in the garden of Indra, called Nandana, which, as well as others, yield all that is deſired of it. See Indra.

KALSCHARPOVI, in *Geography*, a town of Ruſſia, in the government of Ufa; 28 miles S.E. of Burguruſlanſk.

KALSOE, one of the Faroer iſlands.

KALTENBERG, a town of Bohemia, in the circle of Konigingratz; 20 miles N.W. of Gitſchin.

KALTENBRUNN, a town of the duchy of Courland; 24 miles E. of Seelburg.—Alſo, a town of Bavaria, in the principality of Sulzbach; 12 miles N.E. of Sulzbach.

KALTENSTEIN, a town of the biſhopric of Paſſau; 10 miles N. of Paſſau.

KALTHOF, a town of Pruſſia, in the province of Smaland, near Konigſberg.

KALUA, a town of Pruſſia, in Pomerelia; 8 miles E. of Marienburg,

KALUADA, a town of the Arabian Irak, on the Tigris; 10 miles S.E. of Bagdad.

KALUBBLUB, a ſmall iſland in the Eaſt Indian ſea, near the S.W. coaſt of Mindanao. N. lat. 6° 46'. E. long. 121° 32'.

KALUGA, a city of Ruſſia, and capital of a government, called "Kalatſkoe," or "government of Kaluga," ſituated on the Occa; a place of conſiderable trade, and one of the moſt populous between Cherſon and Moſcow. N. lat. 54° 28'. E. long. 36° 2'.

KALVOLA, a town of Sweden, in the province of Tavaſtland; 12 miles N.W. of Tavaſthus.

KALUOT, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 63° 21'. E. long. 21° 39'.

KALUTSKOE, or *Government of Kaluga*, a government of Ruſſia, bounded on the N. by that of Moſcow, E. by thoſe of Moſcow and Tula, S. by Orlovſkoe, and W. by Smolenſkoe, about 140 miles long, and from 30 to 90 broad, divided into 12 diſtricts. See Kaluga.

KAMA. See Kamma.

Kama, a ſmall iſland in the N. ſea, near the coaſt of Lapland; 10 miles N. of Suroe.

Kama, in *Hindoo Mythology*, is the god of love. "The Hindoo god," ſays ſir W. Jones, "appears evidently the ſame with the Grecian Eros, and the Roman Cupid: but the Indian deſcription of his perſon and arms, his family, attendants, and attributes, has new and peculiar beauties. According to the mythology of Hindooſtan, he was the ſon of Maya, or the general *attracting* power, (ſee Maya,) and married to *Reti*, or Affection; and his boſom friend is *Vaſanta*, or Spring. (See theſe articles.) He is repreſented as a beautiful youth, ſometimes converſing with his mother and conſort in the midſt of his gardens and temples, ſometimes riding by moonlight on a parrot, or *luri*, and attended by dancing girls or nymphs, the former of whom bear his colours, which are a *fiſh* on a *red* ground. His favourite place of reſort is a tract of country round Agra, and principally the plains of Matra; where Kriſhna alſo and the nine Gopea (ſee Kriſhna), who are clearly the Apollo and Muſes of the Greeks, uſually ſpend the night, in muſic and dancing. His bow of ſugar-cane or flowers, with a ſtring formed of bees, and his five arrows, each pointed with an Indian bloſſom of a heating quality, are equally new and beautiful. He has more than twenty names: that of Kam, or Kama, ſignifies deſire, a ſenſe which it alſo bears in ancient and modern Perſian." Kamdeo is a more popular way of expreſſing his name. He is alſo called Makara-ketu, alluding to the fiſh in his banner, which is ſaid to be the name of the horned ſhark: Makara is alſo the zodiacal ſign Capricorn. Kandarpa, meaning *love*, is another of his names; and Puſhpa-danva, or with a *bow of flowers*. Mara is another. Ananga means the incorporeal, derived from a very popular fable of Kama having been reduced to a mental eſſence by Siva; thus related in the Ramayana, b. i. ſect. 22. "Kandarpa, the wily one, wounding St'hanu, the lord of the gods, while, with uplifted arm, he was engaged in ſacred auſterities, met the deſert of his crime from the eye of the great Rudra—all his members, being ſcorched with fire, fell from his body: he was thence called Ananga (bodileſs) and the place where it happened Kama (deſire)." His name of Smara, the ideal, may refer to his mother Maya, meaning illuſion. Madan, Madamat, and Makadamat, major Moor, from whoſe Hindoo Pantheon this article is taken, deems derived from a root ſignifying *ſweetneſs* and *intoxication*, or pleaſurable merriment, but not approaching to drunkenneſs. Kama is ſaid to have been the ſon of Kriſhna and Rukmeni, that is, incarnated in a ſon of theirs, and then named Pradyamna, the adventures of whoſe ſon Anirudha with the beautiful Uſha are the ſubject of a pretty tale, and a very intereſting drama.

The banner of Kama, a fiſh on a red ground, and his *vahan*, or vehicle, the parrot, or *luri*, have doubtleſs their alluſions; the former poſſibly, as major M. conceives, to the ſtimulating nature of that ſpecies of food ſtirring the blood to aid Kamdeo's ends; and perhaps the enſanguined colouring, and extreme beauty of the *luri*, and, like the fiſh (and the dove of weſtern mythologiſts) its ſuppoſed *aphrodiſiac* tendency as food, may have had a ſhare in guiding a ſelection of attributes for the ardent deity. The ſoft affection and fabled conſtancy of the dove may have weighed with the Greeks; although conſtancy may not, perhaps, in ſtrictneſs, be a characteriſtic of love.

Sir William Jones has addreſſed a ſpirited hymn to this deity. The following ſtanza deſcribes Vaſanta preparing the bow and ſhafts for his miſchievous friend. The flowers with which the five arrows are tipped are of a heating inflaming quality, denoting that it is through the ſenſes that love's ſhafts are felt.

"He bends the luſcious cane, and twiſts the ſtring
With bees; how ſweet! but ah! how keen their ſting!
He with five flow'rets tips thy ruthleſs darts,
Which through five ſenſes pierce enraptured hearts:
Strong Champa, rich in odo'rous gold;
Warm Amer, nurs'd in heavenly mould;
Dry Nakeſer, in ſilver ſmiling;
Hot Kitticum our ſenſe beguiling;
And laſt, to kindle fierce the ſcorching flame,
Loveſhaft, which gods bright Bela name."

The Champa or Chumpa, or more correctly Champaka, is a polyandrian polygynian flower, the michelia of European botaniſts; it is of two ſorts, white and yellow; ſmall, and in its foliage like an expanded roſe-bud. Gardeners make and expoſe for ſale, chaplets and long ſtrings of the bloſſom, which looſe women, on the ſuppoſition that its fragrance excites favourable ſenſations in the votaries of Kama, decorate their hair with, and wear round their necks: its fragrance is, however, ſo potent, that nerves unaccuſtomed to it can ſcarcely bear it within doors. Another flower, called *mugry*, is of the ſame deſcription, and may, perhaps, be one of thoſe claſſically named in the hymn. The odour of the champa is ſo ſtrong, that bees are ſaid not to extract honey from it; a circumſtance that could not eſcape the keen eye of the Hindoo poets, and they accordingly imagine the champa to be ſadly mortified at the neglect. They have, however, conſoled it by dedicating it to Kriſhna, the black deity; as they, contrary to the notion of ſome European naturaliſts, conſider the union of yellow and black as peculiarly beautiful. The champa is farther conſoled by the preference it has obtained in bedecking the gloſſy locks of black-haired damſels, as juſt noticed; and in the following ſtanza, literally tranſlated from the Sanſcrit:

"That thou art not honoured by the ill-diſpoſed bee, why, O Champaka! doſt thou ſo heavily lament. The locks of lotas-eyed damſels, reſembling the freſh dark clouds adorning the ſky; let theſe embelliſh thee."

The Amer, mentioned in the extract from the hymn, is alſo called *amra*, and *amla*, and is ſaid by ſome to be the *mango* flower. Dry Nakeſer is a handſome flower with white and yellow petals. The Bela is a beautiful ſpecies of jaſmine.

Among a refined people, advantageouſly ſituated in a low latitude, we naturally expect to find love, in all its vaſt variety of relations, no inconſiderable proportion of their occupation and amuſement. Books and tales on amatory topics are very abundant in India, and in common life alluſions are conſtantly occurring to Kama and his excitations. The ode, tranſlated from the Sanſcrit, with which we ſhall conclude this article, is a popular canticle on a feſtival held at the full moon of the month Chaitra, in honour of Kamadeva, attended by muſic, bathing, and feſtive jollity. It muſt be recollected that Kama was incarnated as a ſon of Kriſhna, who being Viſhnu is called by one of his names, Madhava, in the ſecond ſtanza. The three firſt ſtanzas conſiſt chiefly of compound words forming names of Kama, for inſtance, Puſhpa-danva, with a flowery-bow; Makaraketa, fiſh-bannered, &c.

1. "Hail, god of the flowery bow! Hail, warrior, with a fiſh on thy banner! Hail, powerful divinity, who cauſeth the firmneſs of the ſage to forſake him, and ſubdueſt the guardian deities of the eight regions!

2. "O Kandarpa! thou ſon of Madhava. O Mara! thou foe of Sambara. Glory be to thee who loveſt the goddeſs Reti: who ſpringeſt from the heart.

3. "Glory be to Madana; to Kama; to him who is formed as the god of gods; to him, by whom Brahma, Viſhnu, Siva, Indra, are filled with emotions of rapture!

4. "May all my mental cares be removed! all my corporeal ſufferings terminate! May the object of my ſoul be attained, and my felicity continue for ever." Hin. Pan. p. 451.

KAMA-DHENU, } names of *Surabhi*; which ſee.

KAMAK, in *Geography*, a town of Turkiſh Armenia, on the Euphrates; 10 miles S.S.W. of Arzingen.

KAMAKURA, a town of the iſland of Niphon, in the gulf of Jedo. N. lat. 35° 10'. E. long. 139° 40'.—Alſo, an iſland of Japan, near the S. coaſt of Niphon, about three miles in circuit, having its coaſts ſo precipitous, that a crane is uſed to raiſe the freight from the boats. This is uſed as a ſtate priſon.

KAMAL, or KAMALA, the Sanſcrit name of the lotus, a plant eſteemed by the Hindoos, as well as by the ancient Egyptians, as very ſacred and myſterious. See LOTUS, or NYMPHÆA, or whatever word under which Egyptian ſuperſtition, connected with the lotus, may be noticed. We ſhall give a ſhort article under LOTUS. An extenſive claſs of Hindoo philoſophers, being Neptuniſts,

tuniſts, look on this aquatic plant with profound reverence; being more eſpecially the ſymbol of humidity; and Viſhnu being a perſonification of water, his worſhippers deem it his emblem alſo. It is farther the name of his conſort Lakſhmi, who, in her character of Venus, generally holds in her hand the lotus, the emblem alſo of beauty, and denoting her aquatic origin. (See Lakshmi, and Lotus.) There is no end of myſtical ſymboliſm connected with alluſions to the lotus among Hindoo mythologiſts. Of theſe many occur in Moor's Hindoo Pantheon. See the index under Kamal and Lotus. Many engravings are likewiſe there given of this ſubject in various combinations.

KAMALADAN, in *Geography*, a bay on the S. coaſt of the iſland of Mindanao. N. lat. 7° 21′. E. long. 121°.

KAMALAVA, a town of Perſia, in Chuſiſtan; 25 miles W. of Toſtar.

KAMALA-YONI, in *Hindoo Mythology*, a name of Brahma, derived, it would appear, from the ſymbols of Lakſhmi and Devi, or Parvati, the conſorts reſpectively of Viſhnu and Siva. The kamal is the lotus, an emblem of female beauty, and a name of Lakſhmi; and the Yoni, the *pudendum muliebre*, moſt myſteriouſly contemplated by the votaries of Devi, as the myſtical matrix of nature, and as her ſymbol. It does not, however, clearly appear why theſe terms or things ſhould be conjointly applied to Brahma, the deities creative power. On the ſubjects of this article ſee Kamal, Lakshmi, Lotus, Linga, and Yoni, in this work, which are amply diſcuſſed in the Hindoo Pantheon.

KAMALIA, in *Geography*, a town of Africa, in Manding, the inhabitants of which are partly Pagans and partly Mahometans. Mr. Park, in his return home, was taken ill of a fever in this town. This ſevere and dangerous ſickneſs was owing to exceſs of fatigue, to viciſſitudes of weather, and to the various hardſhips which he encountered, being ſometimes plunged to the neck in rivers and ſwamps, and ſometimes loſt in woods and deſerts, without ſhelter, cloathing, or food. In this diſtreſſed condition, and whilſt he was waiting for a caravan with which he might purſue his journey towards the Gambia, he was hoſpitably entertained by a worthy negro, whoſe name was Karfa Taura, who not only undertook, for the value of one ſlave, to be paid on his ſafe arrival at the Gambia, not only to conduct him ſafe to Piſania, but to accommodate him in his houſe until the time of the caravan's departure. During the long interval of ſix months, not a murmur eſcaped the lips of Karfa, or of any of his wives, at the trouble and expence which their inmate, who was confined more than a month to his mat (his only bed), brought upon them. To the kind attention, the tender ſolicitude, the cheerful aſſiduity, and unwearied hoſpitality of theſe poor pagans, Mr. Park declared that he was indebted, not only for his ſafe return to Great Britain, but alſo for the preſervation of his life; and he gratefully acknowledges, that he made his friend Karfa but an inadequate return (though the beſt in his power), by preſenting him, on their arrival at the Gambia, with double the ſum which he had originally promiſed. Kamalia is diſtant about 40 geographical miles S.W. of Sibidooloo, and lies nearly midway between the Joliba and Senegal rivers. N. lat. 12° 46′. W. long. 6° 25′.—Alſo, a town of Africa, in the kingdom of Bambarra, on the Niger; 18 miles S.W. of Sego.

KAMAN, a town of Aſiatic Turkey, in Caramania; 27 miles N.W. of Kaiſarieh.—Alſo, an iſland in the Red ſea. N. lat. 27° 35′.—Alſo, a town of Walachia; 16 miles S.W. of Ruſei.—Alſo, the name given by Tavernier to the *Combam*, or *Commum*, of others, which is the frontier town of the Carnatic, towards Golconda, near the ſource of the river Gondegama, or Gandlecomma.

Kaman, in *Natural Hiſtory*, a name given by many authors to a ſtone found about the burning mountains, and at ſome times uſed to engrave ſeals on. It is deſcribed as a white ſtone, variegated with ſeveral colours.

KAMARIS, in *Geography*, a town of Aſiatic Turkey, in Natolia; 22 miles W. of Artaki.

KAMBALA, mountains of Thibet, between lake Jamdoo and the Sampoo river.

KAMBAMBA. See Cambamba.

KAMBELE, a town of Perſia, in the province of Mecran, on the ſea-coaſt; 120 miles S. of Kidge.

KAMBERG, a town of Bohemia, in the circle of Kaurzim; 12 miles S. of Beneſchov.

KAMCHADALS. See Kamstchatka.

KAMEH, a province of Candahar, lying W. of Cabul, N. of Cabul river, nearly oppoſite to Jalalabad.—Alſo, a river of Aſia, called *Cabul;* which ſee. It is formed of various ſtreams that iſſue from the northern mountains, and join in the diſtrict of Kameh, whence the confluent river receives its name, and which it communicates to the Cabul river during the remainder of its courſe.

KAMEINOI, a town of Ruſſia, in the government of Pſkov; 12 miles S.E. of Opogka.

KAMEL, George Joseph, in *Biography*, a jeſuit miſſionary, who lived at the end of the 17th century, and ſent various plants from the Philippine iſlands to the botaniſts of Europe. See Camellia.

KAMELEY, in *Geography*, a town of Africa, in Sennaar; 60 miles S. of Gerri.

KAMEN, a town of the duchy of Warſaw; 12 miles S.E. of Gneſna.

KAMENI. See Kammeni.

KAMENITZ, a town of Bohemia, in the circle of Bechin; 24 miles E. of Bechin. N. lat. 49° 21′. E. long. 14° 56′.—Alſo, a town of Moravia, in the circle of Iglau; 13 miles E. of Iglau.

KAMENIZ, a town of Bohemia, in the circle of Chrudim; 10 miles S. of Chrudim.

KAMENKA, a town of Ruſſia, in the government of Tobolſk; 120 miles E. of Eniſeiſk.

KAMENOI, a town of Ruſſia, in the government of Ochotſk, at the northern part of the Penzinſkaia gulf, containing about 400 inhabitants; 16 miles S. of Oklanſk.

KAMENSKAIA, a town of Ruſſian Tartary, in the country of the Coſſacks, on the Donetz; 122 miles N. of Azof.

KAMENSKOI, a town of Ruſſia, in the government of Archangel; 124 miles S.E. of Kola.—Alſo, a town of Ruſſia, in the province of Ekaterinburg, on the Iſet; 40 miles S.E. of Ekaterinburg.

KAMERAN, an iſland in the Red ſea, near the coaſt of Arabia, governed by a Dola, ſubordinate to the Dola of Loheia: the ſoil is fertile, and it has a good harbour, which affords refreſhment to veſſels that touch at it in their voyage from the Indies to Jidda. N. lat. 15° 6′. E. long. 42° 25′.

KAMERIE, a town of Arabia, in the province of Yemen; 48 miles S. of Saade.

KAMERINA, a town of Poland, in the palatinate of Kiev; 12 miles S.E. of Czyrkaſy.

KAMERITZ, a town of Bohemia, in the circle of Bechin; 16 miles N. of Fiſtritz.

KAM-HI, in *Biography*, emperor of China, was the grandſon of a Tartar prince, who conquered that country in 1644, and aſcended the throne in 1661. He had a great attachment to the arts and ſciences of the Europeans, and liberally patronized the miſſionaries. He was a good geographer, and directed the conſtruction of many maps and charts, yet ſo vain was he of the country over which he governed, that he would never ſuffer a map of the world to be laid before him unleſs China was repreſented therein as the centre. He died at the age of 71, in the year 1722.

KAMI, in *Geography*, a town of Japan, in the iſland of Niphon; 20 miles E.N.E. of Jedo.

KAMIABA, a town of Africa, in Manding. N. lat. 12° 32′. W. long. 6° 15′.

KAMIAMACONDA, a town of Africa, in the country of Jemarrow. N. lat. 12° 48′.

KAMIEN, a town of Poland, in the palatinate of Volhynia; 34 miles N. of Lucho.—Alſo, a town of Lithuania, in the palatinate of Wilna; 64 miles E. of Lida.

KAMIENEC, a town of Lithuania, in the palatinate of Brzeſc; 16 miles N.N.E. of Brzeſc.

KAMIENTSCHIK, a town of the duchy of Warſaw; 36 miles E.N.E. of Warſaw.

KAMIFSHELER, a town of Circaſſia, on the coaſt of the Black ſea; eight miles E.S.E. of Mamak.

KAMINIEC, a town of Ruſſian Poland, and capital of the palatinate of Podolia, having a caſtle built on a rock, and one of the beſt fortified places in Poland. Below it runs the river Smetricz, which falls into the Dnieſter. It has a Popiſh and Armenian biſhop reſident in the city; and here are alſo held a court of juſtice and provincial diet. The epiſcopal ſee was founded in 1375. Its college formerly belonged to the Jeſuits. The whole province is ſometimes called "Kaminiec:" 100 miles W. of Braclaw. N. lat. 48° 53′. E. long. 26° 45′.

KAMIONKA, a town of Poland, in Volhynia; 48 miles N.N.E. of Zytomiers.

KAMIR, a town of Perſia, in the province of Lariſtan; 60 miles E.S.E. of Lar.

KAMISCHIN, a town of Ruſſia, in the government of Saratof, on the Volga; 80 miles S. of Saratof.

KAMITNICZA, a town of Poland, in the palatinate of Braclaw, near the Dnieſter; 54 miles S. of Braclaw.

KAMITSKI, a town of Japan, in the iſland of Ximo; 28 miles E.S.E. of Kokara.

KAMMA, a river of Ruſſia, which is the largeſt of all thoſe that unite their ſtreams with the Volga. It riſes in the government of Perme, from the weſtern projections of the Ural chain, waters a ſmall part of the government of Viatka, flows through a large tract of the government of Perme, forms the border between the governments of Viatka and Ufa, and at Laiſheva, 60 verſts below Kazan, falls into the Volga; having terminated a courſe of 1000 verſts. By the Tartars it is called "Tſholman-Idel." For the tranſport of ſalt and iron, it is one of the moſt important rivers of the empire. This is chiefly effected by the Tchuſſovaiya and the Belaiya, two rivers of conſiderable magnitude, flowing into it on the left. Beſide theſe, the Kamma takes up a great number of other rivers, ſuch as, on the left, the Kolva, the Yaiva, the Koſva, and the Ik; on the right, the Obva, the Okhau, and the Umyak. The Kamma, above the mouth of the Belaiya (which is of a whitiſh water), has a blackiſh wholeſome water. It is moſtly attended by a ridge of mountains, conſiſting of ſand, gypſum, and marle, with foreſts of firs and oaks. It is tolerably well ſtored with fiſh; and they are reckoned better taſted than thoſe of the Volga.

KAMMAGOJAH, a town of Africa, in the country of Quoja.

KAMMAH, a town of Aſia, and capital of a diſtrict in the kingdom of Birmah, on the Irawaddy; which carries on a large trade in teak timber, conveyed from hence to Rangoon; 15 miles N. of Prome.

KAMMENI, Great and Little, two iſlands of the Grecian Archipelago, ſo called on account of the nature of the calcined ſubſtances of which they are formed; the name denoting "burnt;" whence they have obtained the appellation of *Burnt* iſlands. The firſt of theſe roſe above the ſea in a ſurpriſing manner, whilſt the waters boiled up, and on account of its origin, which bordered on a prodigy, and which occaſioned it to be conſecrated by the ancients to the god of hell, it was denominated "Hiera." In the year 1743, during ſubterraneous commotions and convulſions, and various other terrifying phenomena, another iſland ſuddenly appeared above the ſurface of the waters. In order to diſtinguiſh it from the former, which is the larger, the Greeks have called it "Mikri Kammeni," or the Little Burnt iſland. Theſe iſlands are within about three miles W. of Santorin. N. lat. 36° 30′. E. long. 25° 24′. The Great Kammeni, which is the more ancient, is covered with a thin ſtratum of duſt, which allows a few herbs to grow upon it. The Little Kammeni, in which are viſible ſix craters, by which the volcano vomited forth the ſubſtances that compoſe it, is naked and barren. At the beginning of the laſt century a new iſlet appeared between the Great and Little Kammeni, about a league from Santorin. Its formation, accompanied with ſhocks of earthquakes, which were felt at Santorin, was gradual; and various circumſtances attended it, which are minutely deſcribed by Sonnini in his "Travels in Greece and Turkey."

KAMNIG, a town of Sileſia, in the principality of Neiſſe; 8 miles N.N.E. of Patſchkau.

KAMNITZ, or Chemnitz, a town of Bohemia, in the circle of Leitmeritz: the principal article of trade is the manufacture of ſtockings; 30 miles S.E. of Dreſden. N. lat. 50° 47′. E. long. 14° 32′.

KAMO, a town of Japan, on the ſouth coaſt of the iſland of Jedo.

KAMOETER, a ſmall iſland in the Eaſt Indian ſea. S. lat. 6° 30′. E. long. 132° 5′.

KAMOURASKAS, a town of Canada, on the right bank of the St. Lawrence. N. lat. 47° 33′. W. long. 69° 40′.

KAMRAJE. See Cashmere.

KAMSCHEVSKA, a town of Ruſſia, in the province of Ekaterinburg, on the Iſet,; 52 miles S.E. of Ekaterinburg.

KAMSCHLOV, a town of Ruſſia, in the province of Ekaterinburg; 56 miles E. of Ekaterinburg.

KAMSIN, hot ſoutherly winds of Egypt, where they are known under the general name of "winds of fifty days." (See Egypt.) Theſe winds have been mentioned by travellers under the denomination of "poiſonous" winds, or, more correctly, "hot winds of the deſert." By the Arabs of the deſert they are called "Semoum," or poiſon; and by the Turks "Shamyela," or wind of Syria, from which is formed the "Samiel" wind. The heat of theſe winds is ſometimes ſo exceſſive, that it may be compared to the heat of a large oven at the moment of drawing out the bread. When they begin to blow, the atmoſphere aſſumes an alarming aſpect. The ſky, which at other times is clear in this climate, becomes dark and heavy; the ſun loſes its ſplendour, and appears of a violet colour. The air is grey and thick, and filled with an extremely ſubtle duſt, which is univerſally penetrating. This wind increaſes gradually in heat in proportion to its continuance; and its effects are felt by all animated beings. The lungs are contracted and become painful. Reſpiration is ſhort and difficult, the ſkin becomes parched and dry, and the body is conſumed by an internal heat. Large draughts of water afford no relief, nor can any thing reſtore perſpiration. Marble, iron, water, though the ſun no longer appears, are hot. The ſtreets are deſerted, and the dead ſilence of night prevails every where. The inhabitants of towns and villages ſhut themſelves up in their houſes, and thoſe of the deſert in their tents, or in pits dug in the earth, waiting the termination of this deſtructive heat. It uſually laſts three days, but if it exceeds that time, it becomes inſupportable. The danger is moſt imminent when it blows in ſqualls, for then the heat is ſo much increaſed, as to cauſe ſudden death by ſuffocation. This wind is peculiarly fatal to perſons of a plethoric habit, and to thoſe that are exhauſted by fatigue. The corpſe manifeſts ſigns of that putrid fermentation, which takes place in animal bodies when the humours become ſtagnant. Theſe accidents are to be avoided by ſtopping the noſe and mouth with handkerchiefs; and the camels bury their noſes in the ſand, and keep them there till the ſquall is over. Another quality of this wind is its extreme aridity; which is ſuch, that water ſprinkled on the floor is evaporated in a few minutes: it withers and ſtrips all the plants, and exhales too ſuddenly the emanations from animal bodies, and produces that feveriſh heat which reſults from ſuppreſſed perſpiration.

Theſe hot winds are not peculiar to Egypt, they blow likewiſe in Syria; more frequently, however, near the ſea, and in the deſert, than in the mountains. M. Niebuhr met with them in Arabia, at Bombay, and in the Diarbekir: they are alſo known in Perſia, and in the eaſt of Africa, and even in Spain, and though their direction may vary, their effects are ſimilar. In Egypt, the moſt violent proceed from the S.S.W.; at Mecca, from the E.; at Surat, from the N.; at Baſſora, from the N.W.; from the W. at Bagdad; and in Syria from the S.E. They always proceed, ſays Volney, from deſert continents; and he adds, it is natural that the air which covers the immenſe plains of Lybia and Arabia, meeting there with neither rivulets nor lakes, nor foreſts, but ſcorched by the rays of a burning ſun, increaſed in intenſity by the reflection of the ſand, ſhould acquire a prodigious degree of heat and aridity; hence he infers that theſe qualities are owing to the heat of the ſun upon the ſands. Volney's Travels in Egypt, &c. vol. i.

KAMTSCHATKA, a river of Ruſſia, in the peninſula of that name. See below.

Kamtschatka, a peninſula of Ruſſia, in the government of Irkutſk, deriving its name from the river Kamtſchatka, which is ſuppoſed to have been ſo called from ſome brave warrior named Konſata. It is bounded on the N. by the province of Ochotſk, on the E. and S. by the Northern Pacific ocean, and on the W. by the ſea of Ochotſk, and the Penſhinſkoe gulf. On the ſouthern promontory, the Kurilly iſlands are included in it, and towards the weſt it is connected with North America by the Aleutan iſlands. This country conſiſts of a chain of mountains, forming one train with the very mountainous and rocky iſlands of Kurilly and Japan, and theſe again ſeem to be connected with the mountains that reach from Thibet through China. All theſe countries and iſlands ſeem to have ariſen by ſubterraneous fires, which ſtill continue to act, much more lately than Siberia. The peninſula of Kamtſchatka, according to the account given of it by captain King, who viſited it in October 1779, lies on the eaſtern coaſt of Aſia, running nearly N. and S. from 52° to 61° N. lat.; the longitude of its ſouthern extremity being 156° 45′. E. The iſthmus which joins it to the continent on the N. lies between the gulf of Olutorſk, and the gulf of Penſhinſk. Its ſouthern extremity is cape Lopatka, a word ſignifying the blade-bone of a man, and ſo called from its ſuppoſed reſemblance to it. The ſhape of the whole peninſula is not unlike that of a ſhoe, widening from the toe, that is cape Lopatka, towards the middle, and again narrowing towards the heel, the neck of land above-mentioned connecting it with the continent. Its greateſt breadth is from the mouth of the river Tigil to that of Kamtſchatka, and is computed to be 236 miles, from whence it narrows very gradually towards each extremity. It is bounded on the N. by the country of the Koriaks, from which it is ſeparated, according to the Ruſſian geographers, by Olutorſkoi-noſs, which is the ſouthern boundary of the Koriaki country. A chain of high mountains ſtretches through the whole length of the country from N. to S.; dividing it nearly into two equal parts, from which a great number of rivers take their riſe, and empty themſelves, on each ſide, into the Pacific ocean, and the ſea of Ochotſk. There are three rivers of much greater magnitude than the reſt; the "Bolchoireka," or great river, the "Kamtſchatka," and the "Awatſka." The firſt diſcharges itſelf into the ſea of Ochotſk, and is navigable for the Ruſſian galliots, upwards of five leagues from its mouth, or within nine miles of Bolcheretſk, a town ſituated at the conflux of the Goltſoſſka and the Biſtraia, which here loſe themſelves in the Bolchoireka. The Biſtraia, which is no inconſiderable river, has its ſource in the ſame mountain with the Kamtſchatka, and, by taking a direct contrary courſe, affords the Kamtſchadales the means of tranſporting their goods by water, in ſmall canoes, almoſt acroſs the whole peninſula. The river Kamtſchatka, after purſuing a courſe of nearly 300 miles from S. to N., winds round to the eaſtward, in which direction it empties itſelf into the ocean, a little to the ſouthward of Kamtſchatkoi-noſs. Near the mouth of the Kamtſchatka, to the N.W. lies the great lake, called Nerpitſch, from "nerpi," a Kamtſchadale word, ſignifying a ſeal, with which this lake abounds. About 20 miles up the river, reckoning from the mouth of the lake, is a fort called Niſhnei Kamtſchatka Oſtrog, where the Ruſſians have built an hoſpital and barracks, and which is ſaid to have become the principal mart in this country. The river Awatſka riſes from the mountains ſituated between the Bolchoireka and the Biſtraia, and running, from N.W. to S.E., a courſe of 100 miles, falls into the bay of Awatſka. The Tigil is likewiſe a river of conſiderable ſize, riſing amidſt ſome very high mountains, which lie under the ſame parallel with Kamtſchatkoi-noſs, and running in an even courſe from S.E. to N.W. falls into the ſea of Ochotſk. The ſoil of this peninſula is extremely barren, and ſeems to be incapable of profitable cultivation, either in the way of paſturage, or in any other mode.

The face of the country, in general, is thinly covered with ſtunted trees, having a bottom of moſs, mixed with low weak heath, and bears a more ſtriking reſemblance to Newfoundland than to any other part of the world which Capt. King had ever ſeen. He was informed, however, by major Behm, the late governor, that many parts of the peninſula, particularly the banks of the river Kamtſchatka and the Biſtraia, produce graſs of great height and ſtrength, which they cut twice in the ſummer; and that the hay is of a ſucculent quality, and particularly well adapted to the fattening of cattle. From other accounts it appears that there is no part of the country equal in fertility to that which borders on the river Kamtſchatka; and that to the N. and S. it is much inferior both in point of ſoil and climate. Repeated experiments have been made in the culture of oats, barley, and rye, in different quarters near this river, which have generally ſucceeded; and it is not doubted, that wheat, in many parts, particularly near the ſource of the Biſtraia and Kamtſchatka, would grow as well as in the generality of countries ſituated in the ſame latitude. The fertility of this part of the country may probably be owing to its being the wideſt interval of the peninſula, and conſequently moſt remote, on each ſide, from the ſea: whereas the chilling fogs and drizzling weather, which prevail almoſt perpetually along the coaſt, muſt neceſſarily render the parts adjacent very unfit for all the purpoſes of agriculture. The ſeverity of the climate, we may naturally conclude, muſt correſpond to the ſterility of the ſoil, of which it is probably the cauſe. The firſt time, ſays Capt. King, we ſaw this country, was in the beginning of May 1779, when the whole face of it was covered with ſnow, from ſix to eight feet deep. On the 8th of May, at noon, the thermometer ſtood at 32°; and the ſnow lay ſo deep on the ground, that all attempts to cut wood were fruitleſs. On the 12th the thaw began to advance gradually; and in the beginning of June, the ſnow was generally melted from the lowlands. On the fifteenth of this month, the thermometer had never riſen higher than 58°, nor the barometer than 30° 4′. The S. E. wind was the moſt prevalent. On the 24th of Auguſt, the foliage of the trees and all ſorts of vegetation ſeemed to be in the higheſt ſtate of perfection. During this month and September, the weather was very changeable, but in no reſpect ſevere. The winds veered towards the weſt. The greateſt height of the thermometer was 65°, the loweſt 40°. The barometer's greateſt height 30°; its loweſt 29° 3′. So that, upon the whole, during this month, an equal and moderate degree of temperature prevailed. But at the beginning of October, the tops of the hills were again covered with new-fallen ſnow, the wind continuing weſterly. In computing the ſeaſons, the ſpring ſhould not be taken into the account. The interval from the middle of June to the middle of September may properly be ſaid to conſtitute the ſummer. October may be conſidered as an autumnal month; and from thence, to the middle of June, it is perfect winter. It is ſaid that the climate, in the country adjoining to the river Kamtſchatka, is not leſs ſerene and temperate than in many parts of Siberia that are under the ſame latitude. This variation, ſays Capt. King, is probably owing to the ſame cauſes, to which the ſuperior fertility of the ſoil in thoſe parts has been attributed.

The ingenious Mr. Kirwan, in his "Eſtimate of the Temperature of different Latitudes," ſtates the diſtance of Kamtſchatka from the Atlantic to be ſuch, that its temperature is not in any reſpect influenced by it, but rather by that of the North Pacific, to which it adjoins. Accordingly the northern parts of this peninſula enjoy the moſt moderate weather, being chiefly influenced by the North ſea, the temperature of which, even in winter, is milder than that of the ſea below the ſtraits that ſeparate Aſia from America. Speaking of the temperature of the North Pacific ocean, the ſame judicious author obſerves, that this part of it is contracted in latitude 66° to the narrow ſpace of 40 miles; and in latitude 52°, it occupies the ſpace of only 30° in breadth from eaſt to weſt, that is, about 1300 miles: whereas the Atlantic in latitude 52° is about 1700 miles in breadth, and is no where contracted to a leſs ſpace than 700 miles. To which we may add, that the coaſts of Aſia on one ſide, and thoſe of America on the other, are bordered with high mountains, covered with ſnow for a great part of the year; and numerous high iſlands lie ſcattered between both continents. From theſe circumſtances we have ſufficient reaſon for concluding *à priori*, that this ſea ſhould be much colder than that portion of the Atlantic contained between the ſame parallels: for, during the winter, the mountains that line the coaſts are cooled to a much greater degree than the flat coaſts of the Atlantic; and the ſea, where it is narrow, is entirely frozen: in ſummer, heaps of ice, being long ſheltered from the ſun by the iſlands, are carried down into lower latitudes, and the ſnow remains long unmelted on the mountains; ſo that Mr. Kirwan is inclined to think, that the annual temperature of it is at leaſt 4 degrees below that of the ſtandard in correſponding latitudes. But further obſervations are neceſſary for determining with preciſion the mean temperature of any of theſe parts. But it is not in the ſterility of the ground alone that the Kamtſchadales feel the unfavourable temperature of their climate; the uncertainty of the ſummer ſeaſon ſometimes prevents their laying up a ſufficient ſtock of dried fiſh for their winter's proviſion, and the moiſture of the air cauſes worms to breed in them, which not unfrequently deſtroy the greateſt part. The inhabitants of this country are very ſeldom troubled with ſtorms of thunder and lightning; and never but in a ſlight degree. The general ſeverity of the winter, as well as the dreadful hurricanes of wind and ſnow which that ſeaſon brings along with it, cannot be queſtioned, from the ſubterraneous habitations to which the natives are under a neceſſity of reſorting for warmth and ſecurity. Major Behm informed captain King and his companions, that the cold and inclemency of the winter of 1779 were ſuch, that, for ſeveral weeks, all intercourſe between the inhabitants was entirely obſtructed, every one being afraid to ſtir even from one houſe to another, for fear of being froſt-bitten. This extraordinary rigour of climate in ſo low a latitude may be accounted for, from its being ſituated to the eaſt of an immenſe uncultivated tract of country, and from the prevalence of the weſterly winds, blowing over ſo extenſive and cold a continent. The extraordinary violence and impetuoſity of the winds are attributed to the ſubterraneous fires, the ſulphureous exhalations, and the general volcanic diſpoſition of the country. This peninſula abounds in volcanos, of which only three have been, for ſome time paſt, ſubject to eruptions. One of theſe is ſituated in the neighbourhood of Awatſka. The volcano of Tolbatchick is ſituated on a neck of land between the river of Kamtſchatka and Tolbatchick. The mountain, from the ſummit of which the eruptions proceed, is of a conſiderable height, and terminates in pointed rocks. The third volcano is on the top of the mountain of Kamtſchatka, which is mentioned as the higheſt in the peninſula. A thick ſmoke never ceaſes to aſcend from its ſummit, and it has frequent eruptions of the moſt violent and dreadful kind; ſome of which were much talked of when captain King viſited the iſland, and ſeemed to be freſh in the memories of the Kamtſchadales. This country contains numerous ſprings of hot water, and extraordinary pits or wells, at the bottom of which the water ſeems to boil as in a cauldron with prodigious impetuoſity, accompanied with a dreadful noiſe, and diſcharging a thick vapour.

Near the village Milkova a merchant of Irkutſk, in 1760, diſcovered iron ore, and erected ſmelting houſes on the ſpot. Silver ore, though not very rich, is alſo ſaid to have been found in Kamtſchatka. Of the trees which fell under the notice of captain King and his aſſociates, the principal were the birch, the poplar, the alder, (with the bark of which they ſtain their leather,) many ſpecies of the willow, and two ſorts of dwarfiſh pines or cedars, of one of which they made their eſſence for beer, and it was found excellent for the purpoſe. The birch tree was the moſt common; and of this there were three ſorts, two of which are fit for timber, and the third, which is of a dwarfiſh kind, is applied to a variety of uſes. The liquor, yielded by it upon being tapped, is drank without any previous preparation; the bark is converted into veſſels for domeſtic purpoſes; and of the wood they make their ſledges and canoes. Beſides the trees above mentioned, there are the larch, and alſo firs, the ſervice-tree, and two ſpecies of the white-thorn. Of the ſhrub kind, as junipers, the mountain-aſh, roſe-trees, and raſpberry buſhes, the country produces great abundance; together with a variety of berries, which are collected at the proper ſeaſon, and preſerved by boiling them into a thick jam, without ſugar. Theſe are uſed as ſauce to their dried and ſalt fiſh; and are eaten by themſelves, in puddings, and various other ways; and decoctions are alſo made of them for their ordinary liquor. The country furniſhes many wholeſome vegetables in a wild ſtate, ſuch as wild celery, angelica, chervil, garlic, and onions; and upon ſome ſpots of ground in the vallies there are excellent turnips and turnip-radiſhes. They have alſo more recently cultivated potatoes. Major Behm exerted himſelf very laudably in endeavouring to promote agriculture and grazing, and not altogether without effect; and his ſucceſſor, Mr. Aſſeſſor Reinikin, continued theſe endeavours, inſomuch that, in 1782, fron 68½ pood of winter-rye 3416 ſheaves, and from 59¼ pood of barley 24,840 ſheaves, were reaped. Oats, wheat, and buck-wheat, were much injured by the early froſts; but hemp ſucceeds very well. There are two plants in this country that deſerve particular notice, on account of the extenſive uſe to which they are applied: one, called by the natives "Sarana," is the Lilium Kamſkatienſe flore atro rubente, of which Steller enumerates five different ſpecies. The roots are collected in the beginning of Auguſt, dried in the ſun, and laid up for uſe. When roaſted in embers, it ſupplies the place of bread; and baked in the oven and pounded, it becomes an excellent ſubſtitute for flour and meal of every ſort, and in this ſtate is mixed in all their ſoups, and moſt of their other diſhes. It is eſteemed very nouriſhing. The roots of this plant are alſo applied to ſimilar purpoſes at Oonalaſhka. The other plant is called the "Sweet graſs," the Heracleum Sibericum foliis pinnatis, &c. Hort. Upſal. 65. This plant was formerly a principal ingredient in the cookery of moſt of the Kamtſchadale diſhes; but ſince the Ruſſians have obtained poſſeſſion of the country, it is entirely appropriated to the purpoſes of diſtillation. The liquor obtained from it is of the ſtrength of brandy, and is called by the natives "raka." Two pood (72 pounds) of the plant yield generally one vedro (25 pints) of raka. There are ſeveral other plants, which we cannot enumerate. It is ſaid, that the Kamtſchadales (before their acquaintance with fire-arms) poiſoned their ſpears and arrows with the juice of the root of the "zgate" (anemonoides et ranunculus); and that wounds inflicted by them are equally deſtructive to land and marine animals. The Tſchutſki are reported to uſe the ſame drug for this purpoſe at preſent. Of the ſtraw of the "triticum radice perenni ſpiculis binis lanuginoſis," which grows abundantly along the coaſt, they make a ſtrong matting, which they uſe not only for their floors, but for ſacks, bed-clothes, curtains, and a variety of other domeſtic purpoſes. Of the plant called "bolotnaia," growing in the marſhes, and reſembling cyperoides, which is carded like wool, with a comb made of the bones of the ſea-ſwallow, they make various garments, which they uſe inſtead of linen and woollen cloths. The nettle ſupplies the place of hemp and flax, and ſerves in the manufacture of their fiſhing-nets.

The animals of this peninſula are the common fox, the ſtoat or ermine, the zibelline or ſable, the iſatis or arctic fox, the varying hare, the mountain rat or earleſs marmot, the weaſel, the glutton or wolverene, the argali or wild ſheep, rein-deer, bears, wolves, and dogs. The dogs are very numerous; and they are very uſeful in drawing the ſledges, which are the common vehicles of the country. The coaſt and bays of this country are frequented by almoſt every ſort of northern ſea-fowl; the rivers are ſtored with numerous flocks of wild ducks of various ſpecies. In the woods are eagles of a very large ſize; and of the hawk, falcon, and buſtard kind, there are great numbers. This country likewiſe affords wood-cocks, ſnipes, and two ſorts of grouſe, or moor-game. Swans are alſo very plentiful, and generally, in their entertainments, make a part of their repaſt. The ſea-coaſt furniſhes no amphibious animals, except ſeals, which ſwarm in the bay of Awatſka, where they purſue the ſalmon, that are collected there in ſhoals in order to aſcend the rivers. They are alſo found in moſt of the lakes, which communicate with the ſea. The ſea otters reſemble thoſe of Nootka ſound; but ſince the Ruſſians have opened a trade for their ſkins to China, where they are ſold at a price above that of any other kind of fur, they have been hunted almoſt entirely out of the country. Thoſe of the Kurile iſlands are of a ſuperior quality to thoſe of Kamtſchatka, or the American coaſt. Fiſh may be conſidered as the ſtaple article of food, with which providence hath ſupplied the inhabitants of this peninſula. Whales are frequently ſeen, both in the ſea of Ochotſk, and on the ſide of the eaſtern ocean, and when caught, are converted to various uſes. Of the ſkin they make the ſoles of their ſhoes, and ſtrops and thongs for various other purpoſes. The fleſh they eat, and the fat is ſtored up, both for kitchen uſe and for their lamps. The whiſkers are uſed for ſewing together the ſeams of their canoes, and for making nets; and with the under jaw-bones their ſledges are ſhod. They work the bones into knives; the inteſtines are cleaned, and blown like bladders, for containing their oil and greaſe; and of the nerves and veins, they make excellent ſnares. Flat-fiſh, trout, and herrings are abundant; the ſeaſon for the latter begins in May, and they do not remain long on the coaſt; they are fine and large. They have alſo cod of a large ſize; but their principal dependence is on ſalmon, which they lay up in ſtore for their winter proviſions. The ſeaſon of fiſhing, for this ſpecies, laſts from the middle of May till the end of June.

The preſent inhabitants of Kamtſchatka are of three ſorts; the natives, or Kamtſchadales; the Ruſſians and Coſſacks; and a mixture of thoſe two by marriage. The true Kamtſchadales, are, according to Steller, a people of very great antiquity, and have for many ages inhabited this peninſula; and he ſays, that they are originally deſcended from the Mungalians, and not either from the Tunguſian Tartars, as ſome, or the Japaneſe, as others have imagined. Many words, he ſays, in their language have terminations ſimilar to thoſe of the Mungalian Chineſe, and the ſame principle of inflexion or derivation obtains in both languages. They are, in general, under-ſized, as are the Mungalians; their complexion, like theirs, is ſwarthy; they have black hair, little beard, the face broad, the noſe ſhort and flat, the eyes ſmall and ſunk, the eye-brows thin, the belly pendant, the legs ſmall; all which are peculiarities that are to be found among the Mungalians. As the reſult of the whole he infers, that they fled for ſafety to this peninſula, from the rapid advances of the eaſtern conquerors; as the Laplanders, Samoieds, &c. were compelled to retreat to the extremities of the north by the Europeans. The Ruſſians, having extended their conqueſts, and eſtabliſhed ports and colonies along that immenſe extent of coaſt of the Frozen ſea, from the Jeneſei to the Anadyr, appointed commiſſaries for the purpoſe of exploring and ſubjecting the countries ſtill farther eaſtward. They ſoon became acquainted with the wandering Koriaks inhabiting the N. and N.E. coaſt of the ſea of Ochotſk, and without difficulty made them tributary. Theſe being the immediate neighbours of the Kamtſchadales, and likewiſe in the habit of bartering with them, a knowledge of Kamtſchatka followed of courſe. The honour of the firſt diſcovery is aſcribed to Feodot Alexeieff, a merchant, who is ſaid to have ſailed from the river Kovyma, round the peninſula of the Tſchutſki, in company with ſeven other veſſels, about the year 1648. Being ſeparated from the reſt by a ſtorm, near the Tſchukotſkoi-noſs, he was driven upon the coaſt of Kamtſchatka, where he wintered; and in the ſummer following coaſted round the promontory of Lopatka, into the ſea of Ochotſk, and entered the mouth of the Tigil; but he and his companions were cut off by the Koriaks, in endeavouring to paſs by land from thence to the Anadirſk. But as theſe diſcoverers did not live to report what they had done, Volodimir Atlaſſoff, a Coſſack, is reputed the firſt diſcoverer of Kamtſchatka. This perſon, under the quality of commiſſary, penetrated, in 1699, with about 60 Ruſſian ſoldiers, and the ſame number of Coſſacks, into the heart of the peninſula, gained the Tigil, and levying a tribute of furs, proceeded to croſs over to the river Kamtſchatka, on which he built the higher Kamtſchatka Oſtrog, called Verchnei, where he left a garriſon of Coſſacks, and returned to Jakutſk in 1700, with an immenſe quantity of rare and valuable tributary furs. Upon his arrival at Moſcow, he was appointed commander of the fort of Jakutſk, with farther orders to repair again to Kamtſchatka. But as he advanced towards the Anadirſk, he fell in with a bark on the river Tunguſka, laden with Chineſe merchandize, which he pillaged; but in conſequence of a remonſtrance from the ſufferers to the Ruſſian court, he was ſeized at Jakutſk, and thrown into priſon. During the diſgrace and trial of Atlaſſoff, ſeveral ſucceſſive commiſſaries were ſent into Kamtſchatka; but at length Atlaſſoff was reinſtated in his command, and appointed to conduct a ſecond expedition into Kamtſchatka; however, in this ſervice he was guilty of oppreſſion and cruelty, which occaſioned a mutiny among the Coſſacks, and they ſucceeded in getting him diſplaced, and ſeized upon his effects. Accuſtomed to plunder, they were reduced to military diſcipline and ſubjection with great difficulty. The hiſtory of this country, from that period till the grand revolt of the Kamtſchadales in 1731, preſents one unvaried detail of maſſacres, revolts, and ſavage ſanguinary rencounters between ſmall parties, from one end of the peninſula to another. When peace was eſtabliſhed, the country remained tranquil till the year 1740, when a few Ruſſians loſt their lives in a tumult; and except an inſurrection which occurred at Bolcheretſk in 1770, there has been no diſturbance ſince.

After the rebellion of 1731 was quelled, the country recovered itſelf, and became more populous than ever; when, in the year 1767, the ſmall-pox, brought by a ſoldier from Ochotſk, threatened the total extirpation of its inhabitants. It has been computed that near 20,000 died of this diſorder in Kamtſchatka, the Koreki country, and the Kurile iſlands. The inhabitants of whole villages were ſwept away, and their habitations left deſolate. In the diminiſhed ſtate of the natives, with freſh ſupplies of Ruſſians and Coſſacks perpetually pouring into the country, and intermixing with them by marriage, it is probable, that in leſs than half a century there will be very few of them left. According to major Behm's account, there were not, in 1779, more than 3000 who paid tribute, the Kurile iſlanders included. Capt. King underſtood that in the year above-mentioned, there were in the five forts of Nichnei, Verchnei, Tigil, Bolcheretſk, and St. Peter and St. Paul, about 400 Ruſſians and Coſſacks, and near the ſame number at Ingiga, which, though to the N. of the peninſula, was then under the commander of Kamtſchatka; to theſe may be added the Ruſſian traders and emigrants, whoſe number is not very conſiderable.

The Ruſſian government, eſtabliſhed over this country, though military, is in a high degree mild and equitable. The natives are permitted to chooſe their own magiſtrates among themſelves, in the way and with the ſame powers to which they had ever been accuſtomed. One of theſe, under the title of "Toion," preſides over each "oſtrog," who refers merely caſes of difficulty, or crimes of peculiar malignity, to the deciſion of the governor of Kamtſchatka. The Toion has likewiſe the appointment of a civil officer, called a corporal, who aſſiſts him in the execution of his office, and in his abſence acts as his deputy. By an edict of the late empreſs, no crime whatever can be puniſhed with death; but it is ſaid, that, in caſes of murder, the puniſhment of the "knout" is adminiſtered with ſuch ſeverity, that the offender generally dies under it. The only tribute exacted, as an acknowledgment of the Ruſſian dominion, conſiſts, in ſome diſtricts, of a fox's ſkin, in others of a ſable's, and in the Kurile iſles of a ſea-otter's. The tributes are collected by the Toions in their ſeveral diſtricts. The Ruſſians, it is ſaid, have taken great pains in converting the Kamtſchadales to Chriſtianity, and they have ſo far ſucceeded, that there remain few idolaters among them. The religion taught and profeſſed is, of courſe, that of the Greek church. Schools are likewiſe eſtabliſhed in many of the oſtrogs, where the children of both the natives and the Coſſacks are gratuitouſly inſtructed in the Ruſſian language.

The commerce of this country, as far as concerns the exports, is entirely confined to furs, and carried on principally by a company of merchants, inſtituted by the late empreſs. Beſides theſe, there are many inferior traders (particularly of the Coſſacks) ſcattered through the country. The principal merchants, during their ſtay in the country, reſide at Bolchereſk, or the Niſhnei oſtrog, in which two places the trade almoſt wholly centres. The articles of importation are principally European, but not reſtricted to Ruſſian manufactures; many are Engliſh and Dutch; ſeveral likewiſe come from Siberia, Bucharia, the Kalmucks, and China. They conſiſt of coarſe woollen and linen clothes, yarn ſtockings, bonnets, and gloves; thin Perſian ſilks; cottons, and pieces of nankeen, ſilk and cotton handkerchiefs; braſs coppers and pans, iron ſtoves, files, guns, powder, and ſhot; hardware, ſuch as hatchets, bills, knives, ſciſſors, needles, looking-glaſſes; flour, ſugar; tanned hides, boots, &c. It has been obſerved, that theſe articles in general are ſold for treble the price they might have been purchaſed for in England; and though the merchants have ſo large a profit upon theſe imported goods, they have a ſtill larger upon the furs at Kiachta, upon the frontiers of China, which is the great market for them. The beſt ſea-otter ſkins ſell generally in Kamtſchatka for about 30 roubles a-piece; at Kiachta the Chineſe merchant buys them at double that price, and ſells them again at Pekin at a conſiderable advance, where a profitable trade is made with ſome of them to Japan. All furs exported from Kamtſchatka acroſs the ſea of Ochotſk, pay a duty of 10 *per cent.* and ſables a duty of 12; and all ſorts of merchandize imported from Ochotſk pay half a rouble for every pood (36 pounds Engliſh). The duty on exports and imports is paid at Ochotſk; and the tribute, which amounted, in 1779, to 10,000 roubles annually, is collected at Bolcheretſk. Six veſſels, from 40 to 50 tons burthen, were employed by the late empreſs between Ochotſk and Bolcheretſk; five for the tranſportation of ſtores and proviſions from the former to the latter place, and one as a packet boat for conveying diſpatches. Beſides theſe, there are about 14 veſſels employed by the merchants in the fur trade, among the iſlands to the eaſtward. The moſt conſiderable and valuable part of the fur trade is carried on with the iſlands that lie between Kamtſchatka and America.

The houſes in Kamtſchatka are of three ſorts, *viz. jourts*, *balagans*, and *log-houſes*, called there *iſbas*. The firſt are their winter, and the ſecond their ſummer habitations; the third are altogether of Ruſſian introduction, and inhabited only by the better and wealthier ſort. A town of Kamtſchatka is called an "oſtrog," and conſiſts of ſeveral of the three ſorts of houſes above-mentioned; but the balagans are the moſt numerous. St. Peter and St. Paul conſiſts of ſeven log-houſes, 19 balagans, and three jourts. Paratounca is of about the ſame ſize. Karatchin and Natchekin contain fewer log-houſes, but full as many jourts and balagans as the former. The outermoſt garment of the men is of the ſhape of a carter's frock. Thoſe worn in ſummer are of nankeen; in winter they are made of ſkins, moſt commonly of the deer or dog, tanned on one ſide, the hair being left on the other, which is worn innermoſt. Under this is a cloſe jacket of nankeen, or other cotton ſtuff; and beneath that a ſhirt of thin Perſian ſilk, of a blue, red, or yellow colour. The remaining part of their dreſs conſiſts of a pair of tight trowſers, or long breeches, of leather, reaching down to the calf of the leg; of a pair of dog or deer-ſkin boots, with the hair innermoſt; and of a fur cap, with two flaps, which are generally tied up cloſe to the head, but in bad weather are let to fall round the ſhoulders. On ceremonious occaſions the Toions wear a fur dreſs. The dreſs of the women conſiſts of a full looſe robe of white nankeen, gathered cloſe round the neck, and faſtened with a collar of coloured ſilk. Over this they wear a ſhort jacket without ſleeves, made of differently coloured nankeens, and petticoats of a ſlight Chineſe ſilk. Their ſhifts, which have ſleeves down to the wriſts, are alſo of ſilk; and coloured ſilk handkerchiefs are bound round their heads, concealing entirely the hair of the married women, whilſt thoſe who are unmarried, bring the handkerchief under the hair, and ſuffer it to flow looſe behind.

The Kamtſchadales amuſe themſelves with ſinging and dancing. Their dancing they ſeem to have learned from the bears, which is intended to repreſent the awkward and clumſy geſtures of this animal. The body was always bowed and the hams bent, whilſt the arms were uſed in imitating the tricks and attitudes of that animal. Cook's Third Voyage, vol. iii. Took's Ruſſian Empire, vol. i. Cox's Ruſſian Diſcoveries.

KAMTSCHATKOI Noſs, the ſouthern cape of Kamtſchatka. N. lat 55° 3'. E. long. 163° 20'.

Kamtschatskoi, *Niznei* or *Lower*, a town or oſtrog of Ruſſia, on the E. ſide of the peninſula of Kamtſchatka, about 20 miles from the river Kamtſchatka; containing two churches and about 150 houſes, and having a citadel with magazines, an arſenal, guard-houſe, and barracks. It is the ſeat of two tribunals, one for matters of government, and another for thoſe of commerce; 142 miles E.S.E. of Ochotſk. N. lat. 56° 40'. E. long. 160° 14'.

Kamtschatkoi, *Verchnei* or *Upper*, a town or oſtrog of Ruſſia, in the peninſula of Kamtſchatka, governed by a ſerjeant, and containing about 600 houſes; 60 miles N.N.E. of Bolcheretſkoi. N. lat. 93° 50'. E. long. 157° 39'.

KAN, a river of Ruſſia, which runs into the Eniſei, near Bilchutzko, in the government of Kolivan.—Alſo, a river of China, which riſes in the S. part of Kiang-ſi, and runs into the lake Po-yang; 20 miles N. of Tchang.

Kan, or *Khan*. See Khan.

KANA, in *Geography*, a town of Arabia, in the province of Hed-jaz; 40 miles E.S.E. of Hajar.

KANAAP, a town of Hindooſtan, in Bahar; 47 miles S.S.W. of Patna.

KANADEI, a town of Ruſſia, in the government of Simbirſk; 72 miles S.S.W. of Simbirſk.

KANAGA, one of the Andreanoffkie iſlands, between Kamtſchatka and America, which has a high ſmoking mountain.

KANAHOODY, a town of Perſia, in the province of Coheſtan; 100 miles W.S.W. of Niſabur.

KANAKI, a ſmall iſland in the gulf of Engia, near the W. coaſt of Coluri.

KANAMBADDY, a town of Hindooſtan, in Myſore; 8 miles W. of Seringapatam.

KANAN, a town of Africa, in the kingdom of Cayor, near the Atlantic. N. lat. 16° 40'. W. long. 15° 55'.

KANANIKOLSKOI, a town of Ruſſia, in the government of Upha; 52 miles S.W. of Sterlitamatzk.

KANAR, a large lake, formed by an expanſion of the river Dewah, in the country of Kemaoon.

KAN-AREDMERD, a town of Perſia, in Farſiſtan; 90 miles S. of Schiras.

KANARNA, a town of European Turkey, in Bulgaria; 22 miles N.E. of Varna.

KANARY, a ſmall iſland in the Eaſt Indian ſea, ſurrounded by a number of iſlets, called by this name. S. lat. 1° 44'. E. long. 129° 54'.

KANAS, or Kangas, a town of Turkiſh Armenia; 60 miles S.E. of Erzerum.

KANASTER, is a name given in America to baſkets of ruſhes or cane, in which they put the tobacco which they ſend into Europe: hence ariſes the name of kanaſter tobacco, the beſt of which comes from Makaribou.

KANAZAVA, in *Geography*, a town of Japan, in the iſland of Niphon; 130 miles N.E. of Meaco.

KANCABA, a town of Africa, in the kingdom of Mandingo, ſeated on the Niger, a mart for ſlaves; 16 miles S.E. of Kamalia.

KANDA, a town of Africa, in the kingdom of Congo; 30 miles N.E. of St. Salvador.—Alſo, a town of Japan, in the iſland of Xicoco; 16 miles S.E. of Ovutſi.

KANDABAGA, mountains that form part of the boundary between Ruſſia and Chineſe Tartary, a part of the great chain W. of the river Oka. See Sayane *Mountains*.

KANDABIL, a town of Perſia in the province of Mecran, 285 miles S. of Candahar. N. lat. 28° 28'. E. long. 67° 20'.

KANDAL, a town on the N. coaſt of the iſland of Java. S. lat. 6° 48'. E. long. 110° 18'.—Alſo, a town of Abyſſinia, near the coaſt of the Red ſea. S. lat. 14° 30'. E. long. 41° 15'.

KANDALAKS, a town of Ruſſia, in the government of Archangel, on the N. coaſt of the White ſea; 140 miles S.S.E. of Kola.

KANDARPA, a name of Kama, the Hindoo god of love. See Kama.

KANDEGHERI, in *Geography*, a town of Hindooſtan, in the Carnatic, formerly the capital of a kingdom, called Narſinga, and the reſidence of a Hindoo king, whoſe dominions extended over Tanjore and Madura. In 1640, a deſcendant of the reigning prince permitted the Engliſh to form a ſettlement at Madras. It is diſtant 70 miles N.W. from Madras. N. lat. 13° 46'. E. long. 79° 24'.

KANDEH-RAO, or Kandoba, in *Hindoo Mythology*, an avatara or incarnation of Siva; his conſort, Parvati, having been alſo incarnated, under the name of Malſara, to accompany her lord in this manifeſtation, which is ſaid by ſome to have occurred in the Carnatic, for the purpoſe of deſtroying a giant named Manimal. A magnificent temple is dedicated to the worſhip of Siva, in this incarnation, at Jejury. It is deſcribed under that article; and by ſome it is ſaid, the incarnation happened there. The incarnated pair are generally repreſented together on horſeback, with a dog, he being four armed. Images and pictures of them are very common in the Mahratta country, where Kandeh-Rao is a popular deity, and is very extenſively propitiated. Several engravings of the ſubject of this article are given in Moor's Hindoo Pantheon.

KANDEK, in *Geography*, a town of Aſiatic Turkey, in the province of Natolia; 48 miles E. of Iſmid.

KANDEL, in *Botany*. See RHIZOPHORA.

KANDERI, in *Geography*, a town of Aſiatic Turkey, in Natolia; 24 miles N.E. of Iſmid.

KANEKING, a town of the Arabian Irak; 23 miles N.N.E. of Shehrban.

KANEM, a city of Africa, in the way from Fezzan to the capital of Bornou. The inhabitants of the adjacent country are compoſed of Muſſulmen and Pagans, and are employed in breeding cattle, and raiſing innumerable horſes for the ſervice of the king; 125 miles N. of Bornou. N. lat. 32°. E. long. 21° 40'.—Alſo, the name given by the geographer Edriſi to the kingdom of *Bornou;* which ſee.

KANG, or *Chineſe Stove*, is a kind of ſtove that is heated by means of a furnace, which caſts all its heat into it. The furnace is adapted to the fire of the ſtove which it is intended to heat; and it may be placed either in a room that is uſed, or an adjoining room, or on the outſide of the houſe. The heat of this furnace, impelled by the outward air, ruſhes through a ſlit into a tube or conductor; and paſſing through this into another pipe or channel at right angles to it, lying under the middle of the floor of the ſtove, ſpreads through the ſtove by vent-holes in this laſt pipe, and is communicated to the bricks which form the pavement of the ſtove, and from them through the whole room. The ſmoke is carried off by funnels at both ends of the ſtoves. See a drawing and deſcription of this kind of ſtove in Phil. Tranſ. vol. lxi. p. i. art. 7.

Any kind of fuel is uſed in the heating furnaces, but ſea-coal is generally uſed: it is obſerved, that in order to draw off the noiſome vapours of the air conſtantly heated by the coal fire, the Chineſe always keep bowls of water in the rooms, and occaſionally renew them; and the emperor's apartments in the palace are decorated with flower-pots, and little orange-trees, &c. which, as the Chineſe philoſophers allege, is the beſt way of ſweetening the air, and abſorbing the fiery particles diſperſed in it.

KANGA, in *Geography*, a ſea-port of Africa, in the kingdom of Loango, ſituated in a ſandy bay of the Atlantic, where veſſels may ride at anchor within muſket-ſhot of the ſhore, in four or five fathoms water.

KANGAANPAA, a town of Sweden, in the government of Abo; 27 miles N.E. of Bjorneborg.

KANGANI, a town of Hindooſtan, in Myſore; 25 miles W. of Tademeri.

KANGASAK, a town of Weſt Greenland. N. lat. 62 . W. long. 48'.

KANGASALA, a town of Sweden, in the province of Tavaſtland; 30 miles N.N.W. of Tavaſthus.

KANGASNIEMS, a town of Sweden, in the province of Tavaſtland; 85 miles N.E. of Tavaſthus.

KANG-CHAN, a town of Corea; 16 miles S.W. of Kang-tcheou.

KANGEE, a town of Africa, in the kingdom of Kaſſon; 33 miles S.E. of Kooniakary.

KANGELANG, an iſland in the Eaſt Indian ſea, about 25 miles from eaſt to weſt, indented on the ſouth coaſt with two or three conſiderable bays. S. lat. 6° 37'. E. long. 115° 44'.

KANGIS, a town of Sweden, in Weſt Bothnia; 80 miles N. of Tornea.

KANG-TCHEOU, a town of Corea, in Kinchan; 170 miles S.E. of Peking. N. lat. 35° 46'. E. long. 128° 49'.

KANG-TCHEOU, a city of China, of the firſt rank, in the province of Kiang-ſi; ſituated on a river of the ſame name. Its river, port, riches, and population, ſerve to attract ſtrangers. Near the walls of the city is a very long bridge, compoſed of 130 boats, joined together by ſtrong iron chains. The cuſtom-houſe is upon this bridge, where a receiver conſtantly reſides, to viſit all barks, and examine if they have paid the neceſſary duties. Two or three moveable boats are ſo placed, that by their means the bridge can be opened or ſhut, to give or ſtop a paſſage; and no barks are ſuffered to paſs that have not been examined. In the territory belonging to this city, a great number of thoſe valuable trees grow, from which varniſh diſtils. Its diſtrict is extenſive, and contains twelve cities of the third claſs. N. lat. 25° 32'. E. long. 114° 30'.

KANG-TCHIN, a town of Corea; 48 miles S.S.W. of Koang-tcheou.

KANGUROO, in *Zoology*, an animal on the coaſt of New Holland, which, when full grown, is as big as a ſheep, and in form reſembling the jerboa. The head, neck, and ſhoulder, are very ſmall in proportion to the other parts of the body; the tail is nearly as long as the body, thick near the rump, and tapering towards the end: the fore-legs of one of them meaſured only eight inches in length, and the hind-legs twenty-two: the progreſs is by ſucceſſive leaps or hops of a great length, in an erect poſture: the fore-legs are kept bent cloſe to the breaſt, and ſeem to be of uſe only for digging. The ſkin is covered with a ſhort fur, of a dark mouſe or grey colour, excepting the head and ears, which bear a ſlight reſemblance to thoſe of a hare. Hawkeſworth's Voyages, &c. vol. iii. p. 174.

KANHAWA, in *Geography*, a large mountainous county of America, on the weſtern line of Virginia, having the Ohio river on the north-weſt, and Kentucky on the weſt. The population conſiſts of 3008 free inhabitants, and 231 ſlaves. About ſeven miles from the mouth of Elk river, in this county, is a burning ſpring, ſufficiently capacious to hold forty gallons. A bituminous vapour conſtantly iſſues from it; and on preſenting a torch within eighteen or twenty inches of its mouth, a column of flame aſcends to the height of three or four feet, and about eighteen inches in diameter, which burns ſometimes for ten minutes, and at other times continues three days.

KANHAWAY, GREAT, a river of Virginia, the head waters of which are in the weſtern part of North Carolina, in the moſt eaſterly ridge of the Alleghany or Apalachian mountains, and ſouth of the thirty-ſixth degree of latitude. Theſe head branches encircle thoſe of the Holſton, from which they are ſeparated by the iron mountain, through which it paſſes ten miles above the lead-mines. About ſixty miles from Little river it receives Green Briar river. About forty miles below the mouth of Green Briar river in Virginia, in the Kanhaway, is a remarkable cataract, the water falling over a rock that traverſes the bed of the river about fifty feet perpendicularly. The obſtacles to the navigation of this river are the Great Falls, ninety miles above its mouth; and from theſe falls to the mouth of Green Briar is a diſtance of 100 miles. Its mouth, where it falls into the Ohio, in the north-weſt part of Virginia, (N. lat. 38° 55′. W. long. 82° 15′) is 280 yards wide.

KANHAWAY, *Little*, a ſmall navigable river of Virginia, 150 yards wide at its mouth in the Ohio, (N. lat. 39° 6′. W. long. 81° 53′) and navigable only ten miles.

KANJA, YANSHA, or *Yanja*, a town of Perſian Armenia, on a ſmall river which runs into the Kur; 150 miles E.N.E. of Erivan.

KANJEE, a town of Hindooſtan, in Berar; 20 miles N. of Notchagong.

KANIKA, a town of Africa, in the kingdom of Bambarra, ſeated on the Niger; 100 miles S.W. of Sego.

KANIOW, a town of Ruſſian Poland, in the palatinate of Kiev, on the Dnieper; 56 miles E. of Bielacerkiew.

KANISS, a town of Africa, in Nubia, on the weſt ſide of the Nile; 25 miles E. of Dongala.

KANITZ, a town of Moravia, in the circle of Brunn; 10 miles S.W. of Brunn. N. lat. 49° 4′. E. long. 16° 21′.

KANKANAN, a town of Hindooſtan, in Lahore; 12 miles S.E. of Lahore.

KANKARU, a town of Africa, in Mandingo. N. lat. 12° 20′. W. long. 5° 45′.

KANKERARA, a town of Hindooſtan, in the circar of Kottah; 32 miles W. of Kottah.

KANKY-LABY, a town of Africa, in the country of Foota. N. lat. 10° 55′. W. long. 16° 5′.

KANNAKA, a town of Hindooſtan, in the country of Kattack, at the mouth of the river Bramnee; 15 miles N.W. of Point Palmiras.

KANNCOONGAN POINT, a cape on the eaſt coaſt of Borneo. N. lat. 1° 3′. E. long. 119°.

KANNEAH, a town of Hindooſtan, in the circar of Sumbul; 15 miles N. of Nidjebabad.

KANNYA, a town of Hindooſtan, in Rohilcund; 35 miles S. of Bereilly.

KANOOERAH, a town of Hindooſtan, in Goondwanah; 75 miles N.N.E. of Nagpour.

KANOON, a town and fortreſs of Hindooſtan, in the country of Mewat; 70 miles S.W. of Delhi. N. lat. 28° 3′. E. long. 76° 30′.

KANOUNG, LITTLE, or KANOUNGLEY, a town of the Birman empire, on the Irrawaddy, in the vicinity of which are plantations of various fruit trees, and fields well fenced and regularly laid down; with every aſpect of induſtry and plenty.

KANOUNG, *Great*, or *Kanoungghe*, a long town, ſituated like the preceding, with a good quay, and well conſtructed wooden ſtairs, conſiſting of 100 ſteps, deſcending to the water's edge. The population in the neighbourhood of this and the forementioned town is conſiderable.

KANOWLY, a town of Hindooſtan, in the country of Viſiapour; 22 miles E.S.E. of Poonah.

KANSA, in *Hindoo Hiſtory*, the uncle of Kriſhna, whom, as his predeſtined deſtroyer, Kanſa made many vain attempts to put to death. After ſeveral fruitleſs efforts, Kanſa ordered all male infants to be ſlain; in a manner that reminds us of the cruelty of Herod on a ſimilar occaſion. See KRISHNA.

KANSAKI, in *Geography*, a town of Japan, in the iſland of Niphon; 28 miles S.W. of Meaco.—Alſo, a town of Japan, in the iſland of Ximo; 15 miles S.W. of Ikna.

KANSEZ, a river of Louiſiana, which runs into the Miſſouri, N. lat. 38° 45′. W. long. 95° 35′.

KANSEZ, *Little*, a river of Louiſiana, which runs into the Miſſouri, N. lat. 38° 17′. W. long. 94° 53′.

KANSEZ, a town of Louiſiana, ſeated on the river Kanſez; 240 miles W. of Genevieve. N. lat. 38° 5′. W. long. 95° 54′.

KANSKOI, a town of Ruſſia, in the government of Kolivan, on the Kan, in which is carried on a conſiderable trade in furs; 140 miles E. of Kraſ-noiarſk.

KANSON, an iſland in the Red ſea, about twenty miles long, and from two to five broad. N. lat. 16° 44′. E. long. 42° 40′.

KANSZILI, a town of European Turkey, in Beſſarabia; 28 miles S. of Bender.

KANT, in *Biography*. See KANTISM.

KANTAMATI, a name of Radha, the wife or miſtreſs of Kriſhna. See RADHA.

KANTERA, EL, in *Geography*, a town of Africa, in the kingdom of Tunis; 14 miles N. of Tunis.

KANTISM, or philoſophy of Emanuel Kant, in the *Hiſtory of Literature*, is the denomination of a ſyſtem of metaphyſical ſcience, invented and propagated with great avidity on the continent, towards the cloſe of the eighteenth century. It is now, even in its birth-place, much neglected; and will probably, in another half century, fall into utter oblivion. The celebrity, however, to which it attained, requires that a pretty full account ſhould be given of it, in a work devoted to the illuſtration of the principles eſpouſed and vindicated by men endowed with ſuperior talents and ardent tempers. We ſhall, accordingly, firſt give a biographical ſketch of the philoſopher, and then endeavour to unravel and develope the ſecrets of his ſyſtem.

Emanuel Kant was born April 22d, 1724, in the ſuburbs of Konigſberg, in Pruſſia. His father, John George Kant, was a ſadler, born at Memel, but originally deſcended from a Scotch family, who ſpelt their name with a C; but the philoſopher, the ſubject of this article, in early life, converted the C into a K, as being more conformable to German orthography. Emanuel, the ſecond of ſix children, was indebted to his father for an example of the ſtricteſt integrity, and the greateſt induſtry; but he had neither time nor talent to be his inſtructor. From his mother, a woman of found ſenſe and ardent piety, he imbibed ſentiments of warm and animated devotion, which left, to the lateſt periods of his life, the ſtrongeſt and moſt reverential impreſſions of her memory on his mind. He received his firſt inſtructions in reading and writing at the charity ſchool in his pariſh; but ſoon gave ſuch indications of ability and inclination to learn, as induced his uncle, a wealthy ſhoe-maker, to defray the expence of his farther education and ſtudies. From ſchool he proceeded to the college of Fridericianum. This was in the year 1740; and his firſt teacher was Martin Kautzen, to whom Kant was ſtrongly attached, and who devoted himſelf with no leſs zeal to the inſtruction of his pupil, and contributed very greatly to the unfolding of his talents. His favourite ſtudy at the univerſity was that of mathematics, and the branches of natural philoſophy connected with them. On the completion of his ſtudies, he accepted a ſituation as tutor in a clergyman's family. In this, and in two other ſimilar ſituations, he was not able to ſatisfy his mind that he did his duty ſo well as he ought: he was, according to his own account, too much occupied with acquiring knowledge to be able to communicate the rudiments of it to others. "I always," ſaid he, "valued the buſineſs of inſtructing of young people; but I could never level myſelf to their infant capacities." Having acted in the capacity of a tutor for nine years, he returned to Konigſberg, and maintained himſelf by private inſtruction, that he might be ready to embrace the firſt opportunity that offered of being introduced to a higher ſphere of action in the univerſity. In 1746, at the age of twenty-two, he began his literary career with a ſmall work, intitled, "Thoughts on the Eſtimation of the Animal Powers, with Strictures on the Proofs advanced by Leibnitz and other Mathematicians on this Point; to which are annexed, various Reflections on the Powers of Bodies in general." In 1754, he publiſhed "An Examination of the Prize-Queſtion of the Berlin Society,—Whether the Earth, in turning round its Axis, by which the Succeſſion of Day and Night was produced, had undergone any Change ſince its Origin? What could be the Cauſes of it; and how we could be aſſured of it?" This work acquired him great reputation as a philoſopher, and paved the way to his long-deſired promotion to a degree in the univerſity. In the year 1755, he was choſen maſter of arts, and entered immediately upon the taſk of lecturing, which he performed to his own ſatisfaction, and the enthuſiaſtic approbation of a very crowded audience. During the ſpace of fifteen years, which he continued in this office, he publiſhed a variety of tracts on the abſtruſe branches of ſcience. Among theſe may be mentioned, 1. "An univerſal Natural Hiſtory and Theory of the Heavens, or an Eſſay on the Conſtitution and mechanical Structure of the whole Globe, according to the Newtonian Syſtem." On this ſubject his biographer ſays, "that the juſtneſs of Kant's theory was, thirty years afterwards, evinced by the practical inveſtigation of Herſchel." 2. "Principiorum primorum Cognitionis Metaphyſicæ nova Dilucidatio." 3. In 1758, he gave the world "New Principles of Motion and Reſt, and the Reſults connected with them in the Fundamentals of Natural Philoſophy." This work excited very much notice, and was afterwards inſerted more at large in his later writings. 4. In 1759, he publiſhed "Conſiderations on Optimiſm." And, 5. In 1763, "The only poſſible Grounds for a Demonſtration of the Deity." In the laſt mentioned work, the author wiſhed to ſhew that without prefuppoſing the independent exiſtence of ourſelves, or that of other ſpirits, ſomething is poſſible; and on that proof alone reſts the grounds by which to demonſtrate the exiſtence of a Deity. This piece contributed very much to eſtabliſh his literary character. The firſt traces of that metaphyſical ſyſtem, which has given ſuch celebrity to the name of Kant, are to be found in his inaugural diſſertation, "De Mundi ſenſibilis atque intelligibilis Forma et Principiis," which was written in the year 1770, when he was appointed to a profeſſorial chair in the univerſity of Konigſberg. He had, previouſly to this, had offers of preferment, which he declined. His reputation and literary character had been long known to the Pruſſian monarch, who had made him repeated offers of a profeſſorſhip in the univerſities of Jena, Erlangen, Mitau, and Halle; and alſo to have inveſted him with the character of privy counſellor. He declined all theſe honours, from an attachment to his native place. He wiſhed to labour and to be uſeful on the ſpot where he had received his phyſical and mental exiſtence; and it was not till March 1770 that the metaphyſical department at Konigſberg became vacant, which was immediately beſtowed upon him. The ſituation required his whole attention to metaphyſical ſubjects, and his ſucceeding publications were almoſt entirely of this nature. He purſued this ſtudy with the moſt unremitting ardour, and entered into all the depths of metaphyſical ſubtlety, in order to unfold the rational powers of man, and deduce from thence his moral duties. It was not till the year 1781, that the full developement of the principles of his ſyſtem appeared in his "Review of pure Reaſon." The German title of this work is "Critik der reinen vernunft;" and the ſyſtem it contains is commonly known under the name of the "Critical Philoſophy." This celebrated work, on which we ſhall ſhortly enlarge, was nearly ſix years publiſhed before its importance was at all underſtood; and it is perhaps one of the moſt ſtriking inſtances of the reverſes of literary fortune, that the bookſeller was about to deſtroy the copies for waſte paper, when a ſudden demand required and exhauſted rapidly three new editions. The doctrine was ſoon preſented, under innumerable forms, by a multitude of commentators; among the earlieſt and moſt diſtinguiſhed of whom were Reihold, the ſon-in-law of Wieland, and the mathematician Schultz. For a conſiderable time the ſyſtem of Kant had, in almoſt every philoſopher of Germany, either an avowed partiſan or determined antagoniſt. In his "Criticiſm of pure Reaſon," he maintained that the doctrine of materialiſm was limited by external objects; and that any pretended perception of things in themſelves, and independent of a ſenſual repreſentation, was utterly impoſſible. This publication, which ſubjected him to much miſrepreſentation, occaſioned a ſecond part in 1783, intitled, "Prolegomena for future Metaphyſics, which are to be conſidered as a Science." In this he illuſtrated his former doctrine, and entirely abſtracted from the definition of metaphyſics any thing ſupernatural. In 1786, he was appointed rector of the univerſity, an office to which he was called a ſecond time in 1788; and in a few months after, he was advanced to be ſenior of the philoſophical faculty. About the year 1798, he took leave of the public as an author, and ſoon after gave up all his official ſituations; and, in conſequence of increaſing infirmities, he retired into an almoſt perfect ſolitude, having been a writer ſixty years, and having written more than ſixty works. During the laſt ten years of his life, his corporeal and mental decay was ſtrikingly and painfully viſible to his friends: but in nothing did the decay of nature diſcover itſelf ſo clearly as in his perfect loſs of memory. An intimate friend, who had been a beloved ſcholar alſo, and who had for many years enjoyed the pleaſure of his ſociety, entered his room a few months before his deceaſe, and with the freedom of a friend, going up to him, embraced him with a ſort of filial reverence. Kant, however, declared that he had not the pleaſure of knowing him. He uſed every means in his power to bring the idea of himſelf freſh in his mind; but it was all in vain: "the ſun of his genius was ſet; the vapour which overſpread the horizon of his ſoul, darkened every object paſt and preſent." He died on the 12th of February 1804. The character of M. Kant called for univerſal reſpect and admiration; and during his life he received from the learned throughout Germany, and from others in diſtant countries, marks of eſteem bordering upon adoration. His principles were made the ſubject of univerſal inveſtigation, and obtained him a multitude of zealous adherents. In the univerſities of Jena, Halle, Gottingen, Erlangen, &c. lectures were delivered on his ſyſtem; and books were written by his advocates, to illuſtrate and defend his doctrines. Profeſſors were even ſent, at the requeſt and expence of princes and crowned heads, to learn more minutely, by a perſonal conference with him, what had not been ſufficiently elucidated in his books. His lectures were conſtantly crowded by young perſons; and, not unfrequently, perſons far advanced in years and knowledge came to ſit, as diſciples, at the feet of the German Gamaliel. Truth was the object of his ſearch, and liberality was the reſult. He wiſhed to eſtabliſh all human knowledge on the firm baſis of reaſon; and rejected all principles as viſionary, which did not admit of a fundamental explication. He conceived, however, of religion as an inherent quality of the ſoul, which panted after ſome higher object than this tranſitory exiſtence. It demanded no proof from without: it flowed of itſelf from within ourſelves. Hence he was accuſed by ſome of myſticiſm, and by others of infidelity: but it ſeems certain from the teſtimony of his beſt friends, and from the whole tenor of his works, that he was a firm believer in the exiſtence of a great Firſt Cauſe, in a future ſtate of rewards and puniſhments, and in Chriſtianity. In his political opinions, he held that all men were originally born free; but, though a citizen of the world, he was, at the ſame time, a friend to peace and good order, and deprecated every violent effort which was made to acquire that freedom to which all men are by nature entitled; and in his own private conduct, he always teſtified due reſpect and ſubmiſſion to eſtabliſhed authorities. By one of his biographers, M. Charles Villers, Kant is repreſented as having never withdrawn, in a life of eighty years, from his native city; contenting himſelf, in the true ſimplicity of a ſage, with the occupations of ſtudy, and the ſociety of a few favoured friends. It is not merely as a metaphyſician that he claims to be conſidered; for there is ſcarcely a ſcience which he has not endeavoured to illuſtrate. He is a mathematician, an aſtronomer, a chemiſt; in natural hiſtory, in phyſics, in phyſiology, in hiſtory, in languages, and literature, and the arts; in all the details of geography, as they relate to the exact ſituation of the parts of the globe, their inhabitants, and productions, every thing is familiar to him. The prominent feature in Kant's intellectual character was the accuracy with which he analyſed the moſt complex ideas. Nothing eſcaped the ſcrutiny of his intellectual eye. Whatever was barely perceivable to others in the moral and phyſical world, became manifeſt to him. He diſcovered, therefore, very eaſily the congruities of other men's ſentiments, and traced with perfect preciſion their errors to their true ſource. He had likewiſe the faculty of unfolding the moſt abſtruſe principles, and digeſting ſingle and individual ſentiments into a ſyſtematic order. Herein conſiſted the originality of his mind. He viewed the world through the medium of his own happy temper, and found every thing around him agreeable and alluring. He is ſaid to have united in the happieſt degree two qualities ſo rarely combined in one perſon, – the greateſt acuteneſs of reaſoning, with the poliſh of a gentleman. He poſſeſſed the enviable talent of making every thing intereſting upon which he ſpoke, and of being able to ſpeak upon every ſubject. Such was profeſſor Kant. We ſhall now touch upon his theory as a metaphyſician.

Beſides employing a vaſt number of words of his own invention, chiefly derived from the Greek language, Kant uſes expreſſions, which have long been familiar to metaphyſicians, in a ſenſe different from that in which they are generally received: and hence a large portion of time is requiſite to enable the moſt ſagacious mind to aſcertain with preciſion the import of his phraſeology. He divides all our knowledge into that which is “a priori,” and that which is “a poſteriori.” Knowledge “a priori” is conferred upon us by our nature; and knowledge “a poſteriori” is derived from our ſenſations, or from experience; and it is, in this ſyſtem, denominated “empyric.” Kant does not, as this diviſion would ſeem to imply, intend to revive the doctrine of innate ideas. He conſiders all knowledge as acquired: he maintains that experience is the productrice of all knowledge, and that without it we could not have had a ſingle idea. Our ideas “a priori,” he ſays, are produced *with* experience, but not *by* it, or do not proceed from it. They exiſt in, and are forms of the mind. They are diſtinguiſhed from other ideas by two marks, which are eaſily diſcerned: they are univerſal and neceſſary; they admit of no exception, and their converſe is impoſſible. Ideas which we derive from experience have no ſuch characters. We can imagine that what we have ſeen, or felt, or heard once, we may ſee, or feel, or hear again; but we do not perceive any impoſſibility in its being otherwiſe. Thus, if I ſee a building on fire, I am certain of this individual fact; but it affords no general knowledge. But if I take twice two ſmall balls, and learn to call twice two four, I ſhall immediately be convinced that any two bodies whatever, when added to any other two bodies, will conſtantly make the ſum of bodies four. Experience affords the opportunity of acquiring this knowledge; but it has not given it: for how could experience prove that this truth ſhould never vary? Experience muſt be limited, and cannot teach what is univerſal and neceſſary. It is not experience which diſcovers to us, that we ſhall always have the ſurface of a whole pyramid, by multiplying its baſe by the third part of its height; or, that two parallel lines extended “in infinitum” ſhall never meet.

All mathematical truths, according to Kant, are “a priori:” thus, that a ſtraight line is the ſhorteſt of all poſſible lines between two given points; that the three angles in any plane triangle are always equal to two right angles, are propoſitions which are true “a priori.” Pure knowledge “a priori,” is that which is without any mixture of experience. Two and two make four, is a truth of which the knowledge is “a priori;” but it is not *pure* knowledge, becauſe the truth is particular. The ideas of ſubſtance, and of cauſe and effect, are “a priori;” and when they are ſeparated from the objects to which they refer, they form, according to this ſyſtem, “void ideas.” It is our knowledge “a priori,” that is, the knowledge which precedes experience, as to its origin, which renders experience poſſible. Our faculty of knowledge has an effect on our ideas of ſenſation, analogous to that of a veſſel which gives its own form to the liquor with which it is filled. Thus, in all knowledge “a poſteriori,” there is ſomething “a priori,” derived from our faculty of knowledge. All the operations of our minds, all the impreſſions which our ſenſes receive and retain, are brought into effect by the conditions, the forms, which exiſt in us by the pure ideas “a priori,” which alone render all our other knowledge certain. Time and ſpace are the two eſſential forms of the mind: the firſt, for impreſſions received by the internal ſenſe; the ſecond, for thoſe received by our external ſenſes. It is by means of the form *ſpace*, that we are enabled, “a priori,” to attribute to external objects impenetrability, diviſibility, &c.; and it is by means of the form *time*, that we attribute to any thing duration, ſucceſſion, &c. Arithmetic is derived from the internal ſenſe, and geometry from that of our external. Our underſtanding collects the ideas received by the impreſſions made on our organs of ſenſe, confers on thoſe ideas unity by a particular energy “a priori,” and thereby forms the repreſentation of each object. Thus a perſon is ſucceſſively ſtruck with the impreſſions of all the parts which form a particular garden. His underſtanding unites theſe impreſſions, or the ideas reſulting from them; and in the unity produced by the act, it acquires the idea of the whole garden. If the objects which produce the impreſſions, afford alſo the matter of the ideas, then the ideas are “empyric;” but if the objects only unfold the forms of the thought, the ideas are “a priori.”

Judgments are divided into two ſpecies; *analytic* and *ſynthetic*. An *analytic* judgment is that in which the attribute is the mere developement of the ſubject, and is found by the ſimple analyſis of the perception,—as, a triangle has three ſides. A *ſynthetical* judgment is that in which the attribute is connected with the ſubject by a cauſe or baſis taken from the faculty of knowledge, which renders this connection neceſſary,—as, iron is heavy; wood is combuſtible; the three angles of a plane triangle are equal to two right angles.

The forms of the underſtanding are, in this ſyſtem, quantity, quality, relation, modality. *Quantity* is diſtinguiſhed into general, particular, and individual; *quality*, into affirmation, negation, infinite; *relation*, into categoric, hypothetic, and disjunctive; and *modality*, into problematic, certain, and neceſſary. M. Kant adds likewiſe to the properties of the four principal forms of the underſtanding a table of categories, or fundamental ideas, "a priori."

Pure reaſon is the faculty of tracing our knowledge "a priori," to ſubject it to principles, to trace it from its neceſſary conditions, till it be entirely without condition, and in complete unity. The great work of Kant is divided into ſeveral parts, under the titles, "Of Æſthetic tranſcendental;" "Of tranſcendental Logic;" "Of the pure Ideas of the Underſtanding;" "Of the tranſcendental Judgment;" "Of the Paralogiſm of pure Reaſon," &c. We cannot, from the nature of our work, diſcuſs all the parts of the ſyſtem; but may obſerve, that the author contends that we know objects only by the manner in which they affect us; and as the impreſſions which they make upon us are only certain apparitions or phenomena, it is impoſſible for us to know what an object is in itſelf. Hence the ſyſtem of Kant has been compared with that of Berkeley, which maintains that ſenſations are only appearances, and that there is no truth, only in our reaſon. But Kant does not go to this length. According to his theory, the underſtanding, when it conſiders the apparitions or phenomena, acknowledges the exiſtence of the objects themſelves, inaſmuch as they ſerve for the baſes of thoſe apparitions; though we know nothing of their reality, and though we can have no certainty but in experience.

Truth, according to our author, conſiſts in the agreement of our notions with the objects, in ſuch a manner as that all men are obliged to form the ſame judgment: belief conſiſts in holding a thing to be true, in conſequence of a perſuaſion which is entirely perſonal, and has not its baſis in an object ſubmitted to experience. There is a belief of doctrine; as, that "there are inhabitants in the planets," which is not the ſame as moral belief; becauſe in moral belief there is ſomething neceſſary. The ordinary mode of teaching the exiſtence of God belongs to the belief of doctrine; and it is the ſame with regard to the immortality of the ſoul: nevertheleſs, the author was a firm believer in the exiſtence of God, and a future ſtate; becauſe, ſaid he, "this perſuaſion renders immoveable my moral principles,—principles which I cannot reject, without rendering myſelf contemptible in my own eyes. I wiſh for happineſs, but I do not wiſh for it without morality; and as it depends on nature, I cannot wiſh it with this condition, except by believing that nature depends on a Being who cauſes this connection between morality and happineſs. This ſuppoſition is founded on the want or neceſſity of my reaſon, and not on my duty. We have, however," ſays Kant, "no certainty in our knowledge of God; becauſe certainty cannot exiſt, except when it is founded on an object of experience. The philoſopher acknowledges that pure reaſon is too weak to prove the exiſtence of a being beyond the reach of our ſenſes. The neceſſity of believing in God is, therefore, only ſubjective, although neceſſary and general for all thoſe beings who conform to their duty. The proofs of natural theology, taken from the order and beauty of the univerſe, are proofs only in appearance. They reſolve themſelves into a bias of our reaſon to ſuppoſe an infinite Intelligence, the author of all that is poſſible; but from this bias it does not follow that there really is ſuch an author. To ſay, that whatever exiſts muſt have a cauſe, is a maxim "a priori;" but it is a maxim applicable only to experience: for we know not how to ſubject to the laws of our perceptions that which is abſolutely independent of them. It is impoſſible to know that God exiſts; but we can comprehend how it is poſſible to act morally on the ſuppoſition of the exiſtence of an intelligent Creator,—an exiſtence which practical reaſon forces theoretical reaſon to adopt. This proof not only perſuades, but even acts on the conviction, in proportion as the motives of our actions are conformable to the law of morality. Religion ought to be the means of virtue, and not its object. Man has not in himſelf the idea of religion, as he has that of virtue. The latter has its principle in the mind: it exiſts in itſelf, and not as the means of happineſs; and it may be taught without the idea of God, for the pure law of morality is "a priori." He who does good by inclination, does not act morally. There are compaſſionate minds, which feel an internal pleaſure in communicating joy around them, and who thus enjoy the ſatisfaction of others; but their actions, however juſt, however good, have no moral merit, and may be compared to other inclinations;—to that of honour, for example, which, while it meets with that which is juſt and uſeful, is worthy of praiſe and encouragement, but not of any high degree of eſteem. According to Kant, we ought not even to do good, either for the pleaſure which we feel in doing it, or in order to be happy, or to render others happy; for any one of theſe motives would be *empiric*, and injure the purity of our morals. We ought to act after the maxims derived "a priori," from the faculty of knowledge, which carry with them the idea of neceſſity, and are independent of all experience; after the maxims which, it is to be wiſhed, could be erected into *general laws* for all beings endowed with reaſon.

Such ſeem to be the leading principles of the philoſophy of Kant. It is not our buſineſs to enter into a critical examination of them; but the reader will find this very ably done in the firſt volume of the Edinburgh Review, ſaid to have been written by Mr., now ſir, James Mackintoſh.

Kant, there is no doubt, was very ſincere in all the opinions which he maintained. He was a moſt decided enemy to falſehood of every kind. He never could endure to hear an untruth even in jeſt; and in his own language, he was ſcrupulous to avoid every thing that could convey a falſe idea of himſelf. Nothing could draw him into a temporary renunciation or qualification of his ſentiments; but wherever a free declaration of his opinions was not found agreeable, he was careful never to appear. He wiſhed, in all his actions, to ſhew himſelf to the world ſimply as he was, unvarniſhed by any falſe art whatever; and he even condemned the attempt to conceal one's merit under a forbidding appearance. He had a high ſenſe of his own dignity, as an individual in the ſcale of exiſtence; and he had no leſs reſpect for every man, as an independent and thinking being, and evinced theſe ſentiments by a reſpectful deportment towards all. For merit under every form, and in every perſon, whether of his own or contrary ſentiments, he teſtified the moſt unequivocal eſteem.

After the death of Mr. Kant, a beautiful medal was executed by M. Abramſon of Berlin, as a memorial of his great talents. On one ſide is a ſtriking likeneſs of the philoſopher, with the inſcription "Immanuel Kant nat. 1724." On the reverſe, the artiſt has attempted to expreſs the ſervices which Kant has rendered to ſpeculative philoſophy, by aſſigning limits to its empire, and to ſhew, at the ſame time, the madneſs of attempting to paſs thoſe limits. This he has repreſented by a Minerva ſeated, and holding an owl in her right hand, which ſhe prevents from flying, with the inſcription, "Altius volantem arcuit." Monthly Magazine, 1805. Edinburgh Review, vol. i. Supp. to Ency. Brit.

KANTO, in *Geography*, a town of Japan, in the iſland of Niphon; 140 miles W. of Meaco.

KANTOR, a country of Africa, on the ſouth ſide of the Gambia, with a capital of the ſame name.

KANTREFF, or KANTREV. See CANTRED.

KANTURK, in *Geography*, a market and poſt-town of the county of Cork, province of Munſter, Ireland, ſituated on the river Dalua; 125 miles S.W. from Dublin, and 4 miles S.E. from Newmarket.

KANWARRAH, a town of Hindooſtan, in the circar of Gurrah; 30 miles S. of Mahur.

KAO, one of the Friendly iſlands, in the South Pacific ocean, called alſo Aghao or Oghao, and Kaybay. S. lat. 19° 12'. E. long. 184° 58'.

KAO-CHAN, a ſmall iſland in the Chineſe ſea, and the moſt weſterly of thoſe called Mi-a-tau; 18 miles N.W. of Teng-tcheou.

KAOLIN, the name of one of the two ſubſtances which are the ingredients of china-ware. The other, which is called *petuntſe*, is eaſily vitrifiable, and this kaolin is ſcarce at all ſo: whence the fire compoſes from a mixture of them both a ſemi-vitrification, which is china-ware. See PORCELAIN.

The kaolin, uſed in the compoſition of porcelain, requires leſs labour than the petuntſe. There are large mines of it in the boſoms of certain mountains, the exterior ſtrata of which conſiſt of a kind of red earth. Theſe mines are very deep, and the kaolin is found in ſmall lumps, that are formed into bricks, after having undergone the ſame proceſs with the *petuntſe*; which ſee. Father d'Entrecolles thinks that the earth called terre de Malte, or St. Paul's earth, has much affinity to the kaolin, although it has not thoſe ſmall ſhining particles which are interſperſed in the latter.

M. Reaumur had an opportunity of examining this ſubſtance, not in its native ſtate, but only in form of ſmall bricks, made out of the paſte of the powder of the native kaolin and water. He found it of a white colour, and ſprinkled all over with fine glittering particles; but theſe he did not judge to be fragments of a different ſubſtance mixed among the maſs, as are the ſmall flakes of talc in our clays and ſands; but that the whole maſs was compoſed of ſome ſtone reduced to powder, and made into a paſte with water, and that theſe larger ſpangles were only coarſer particles of the powder; the examination of which he promiſed himſelf would diſcover what the ſtone was of which they were formed. And this was the more worthy of a diligent inquiry, ſince the petuntſe might eaſily be ſupplied by many of our own earths and ſands; nothing being required of that but a ſubſtance eaſily running into a white glaſs. But the difficulty of vitrifying this other ingredient renders it a thing much more difficult to be ſupplied by one of the ſame nature among ourſelves. The compariſon of theſe, with other mineral ſubſtances, ſoon proved that they were of the nature of talc; or, in other words, that kaolin was talc powdered, and made up into a paſte with water. And to be aſſured whether the whole maſs was talc powdered, or any thing elſe with a mixture of talc, he ſeparated the particles of the kaolin by water, and found the ſmall ones wholly the ſame with the larger; and that the larger, when reduced to powder alone, made with water a paſte wholly the ſame with the kaolin. It is well known, that the fragments of talc have a great reſemblance to the pearly part of ſome ſhell fiſhes: and hence unqueſtionably has ariſen the opinion of porcelain being made of ſea ſhells; ignorant perſons having ſeen the talc of kaolin, and taken it for a ſhelly matter. Talc has not yet been ſucceſsfully uſed in any of our European manufactures of porcelain; but it is eaſy to ſee, from many unanſwerable reaſons, that ſince China porcelain is made of a mixture of vitrifiable and unvitrifiable matter, nothing is ſo likely to ſucceed with us in the place of the laſt of theſe as talc.

1. We know no ſubſtance in the foſſile world ſo difficult to reduce to glaſs as talc, which, if put into the ſtrongeſt of our fires, in a crucible, is not to be vitrified, nor even calcined. 2. We know no ſubſtance which keeps ſo much brightneſs after having paſſed the fire as talc, or that is of ſo pure a white; whence we may alſo learn that it is not to the petuntſe alone, that the china-ware owes its whiteneſs, but that the kaolin is inſtrumental to the giving it that colour. 3. Talc is tranſparent, nay, and in ſome degree keeps its tranſparence after the action of the moſt violent fire. If we are to make porcelain of a vitrifiable and unvitrifiable matter mixed together, yet it is neceſſary that the unvitrifiable one ſhould retain its tranſparence, otherwiſe it would obſcure the maſs; and talc is therefore the only known ſubſtance qualified for this purpoſe. Perſons who have been at the china works, ſay, that the porcelain is made of equal quantities of petuntſe and kaolin, and it is therefore a juſt and exact ſemi-vitrification. 4. Talc is well known to have a great flexibility or toughneſs, and as it is found to preſerve this even after it has paſſed the fire; it is very probable, that it is owing to this property of the kaolin that the china-ware is ſo much leſs brittle than glaſs. Mem. Acad. Par. 1727.

It has been before obſerved, that we may eaſily, in Europe, be provided with different ſubſtances, which will, in our porcelain manufactures, ſupply the place of the petuntſe of China, and talc appears equally qualified to ſerve inſtead of the kaolin. For this purpoſe we may uſe the common Muſcovy talc, or iſinglaſs, uſed by our miniature-painters to cover their pictures inſtead of glaſs, and, by the curious, to preſerve objects for the microſcope; or perhaps the Venetian talc of the druggiſts would ſucceed even better: at leaſt the proceſs is ſo rational, as to be extremely well worth trying.

But this kaolin is more probably an argillaceous earth, from its forming with water a maſs tenacious enough to be made into the loaves into which it is brought over. M. Bomare ſays, that by analyſing ſome Chineſe kaolin, he found it was a compound earth, conſiſting of clay, to which it owed its tenacity; of calcareous earth, which gave it a mealy appearance; of ſparkling particles of mica, and of ſmall gravel or particles of quartz cryſtals. He ſays, that he has found a ſimilar earth upon a ſtratum of granite, and conjectured that it may be decompoſed granite. This conjecture is the more probable, as kaolins are frequently found in the neighbourhood of granites. See CLAY, HOACHI, and PORCELAIN *Earth*.

KAO-TCHEOU, in *Geography*, a city of China, of the firſt rank, in the province of Quang-tong, ſituated in a delightful and fertile country, on a river, about 36 miles from the ſea. The tide ebbs and flows as far as this town, and ſerves for bringing up to it the Chineſe barks. It has in its diſtrict one city of the ſecond claſs, and five cities of the third. On one ſide this diſtrict is ſurrounded by the ſea, and on the other by mountains; and it abounds with peacocks, and ſeveral ſorts of birds of prey. In the vicinity of the town is a kind of ſtone, reſembling marble, and repreſenting, naturally, rivers, mountains, trees, and landſcapes; this ſtone is cut into ſlabs, and formed into tables and other curious pieces of furniture. Crabs are alſo found on the coaſts, ſimilar to thoſe of Europe; but when they are taken out of the water, they become petrified, without any change of their natural figure. The Chineſe phyſicians uſe them as a remedy againſt fevers. N. lat. 21° 40′. E. long. 110° 4′.

KAO-TCHUEN, a town of Corea; 104 miles N.E. of King-ki-tao.

KAPAR, a town of Pruſſia, in the circle of Smaland, 10 miles W. of Konigſberg.

KAPAW, a town of the iſland of Borneo, near the E. coaſt; 100 miles E.S.E. of Nagara.

KAPI, a term in the eaſtern countries for *gate*.

Thus the chief gate of the palace of the emperor of Perſia is called *alla kapi*, the Gate of God. Hence alſo, the officer who has the command of the grand ſeignior's palace gates, is called *capighi bachi*.

KAPILA, in *Biography*, a very eminent literary character among the Hindoos, and founder of one of their philoſophical ſchools, having many tenets in common with the theories introduced to Europe by Pythagoras, eſpecially that of the unlawfulneſs of ſlaying animals to eat, under pretence of a ſacrifice; as ſeemed to have been very extenſively practiſed in India. This benevolent doctrine became ſo approved, that the grateful Hindoos have deified Kapila; affirming that he was an incarnation of the god Viſhnu, under the name of Vaſudeva, as Kapila is called in their ſacred romances, the Púranas. His theory is named Sankya, which ſeems a modification of that called Mimanſa, which correſponds with the Platonic. Theſe points are ſlightly touched on in Moor's Hindoo Pantheon, and the ſame writer, in a poſterior work, (Hindoo Infanticide,) ſays that "Kapila expounded to the Hindoos the ſame tenet (the immortality of things) modified, to give it the attraction of variety and novelty. He, as Epicurus did after him, tricked out his theory in ſo meretricious a ſtile, as to have provoked, from more ſober reaſoners, the opprebrium of atheiſm." See Mimansa and Sankya.

KAPLANIK, in *Geography*, a town of European Turkey, in Macedonia; 60 miles N.E. of Akrida.

KAPLITZ, a town of Bohemia, in the circle of Bechin; 9 miles S.E. of Crumau.

KAPOS, a town of Hungary.—Alſo, a river which runs into the Danube, ſix miles from Mohacs.

KAPOSVAR, a town and caſtle of Hungary, formerly very ſtrong, but now much reduced; 12 miles W. of Altenburg. N. lat. 46° 30′. E. long. 17° 51′.

KAPPAS, a tribe of Illinois Indians, in Louiſiana, formerly very numerous. Their country has good paſturage.—Alſo, a town of Louiſiana, on the Miſſiſſippi; 130 miles S.S.W. of New Madrid. N. lat. 34° 36′. W. long. 91°.

Kappas *Old Fort*, ſituated in Louiſiana, at the mouth of the river St. Francis, and built by the French, principally for a magazine of ſtores and proviſions during their wars with the Chickaſaws, by whom their Illinois convoys were attacked and deſtroyed.

KAPRIAN, a town of European Turkey, in Moldavia; 60 miles E. of Jaſſi.

KAPSBERGER, Johannes Hieronimus, in *Biography*, a German of noble birth, celebrated by Kircher (Muſurgia), and by many others, was not more famed for the number and variety of his compoſitions, than for his exquiſite ſkill in performing upon almoſt every ſpecies of inſtrument; but more particularly on the theorbo lute, which ſeems to have been a new invention in the 17th century. The author's name has not been recorded; but it is ſaid to have been of Neapolitan conſtruction. The difference between the common lute and theorbo, was in the latter having two necks, and thence called in Latin *Cithara bijuga*.

Kapſberger, who aſſiſted Kircher in compiling many parts of his Muſurgia, is highly praiſed by that laborious, but often credulous and viſionary author; but, according to Bapt. Doni, Kapſberger was loquacious and preſumptuous. The truth is, that the practical muſician and the dilettante theoriſt were rivals in the favour of cardinal Barberini, afterwards Urban VIII., a lover and patron of muſic. Both the diſputants were reformers, but with different views: Doni, a credulous believer in the miraculous powers of the muſic of the ancients, without underſtanding the modern; and Kapſberger, an innovator, who wiſhed to have the compoſitions of Paleſtrina baniſhed the church, in order to make way for his own. The feuds of muſicians and their partizans are ſeldom worth recording; as it often happens that they are unable to explain to the public the cauſe of their difference.

KAPSDORF, in *Geography*, a town of Hungary; 26 miles N.N.W. of Caſſovia.

KAPTERO, an iſland in the gulf of Bothnia, near the E. coaſt, about eight miles long and two broad; 2 miles W. of Waſa.

KAPTSCHAK, a large and well-compacted ſtate, which Banty, the kinſman of the great Tchingis or Zingiſkhan, founded, about the year 1240, fell, in the year 1441, into four khanates, *viz.* Kazan, Aſtrachan, Kaptſchak, and the Krim. The firſt of theſe were, ſomewhat more than 100 years afterwards, conquered by the Ruſſians; but the fourth of theſe ſtates preſerved its independency above 230 years longer. At preſent, however, they altogether form a part of the Ruſſian empire. The khanate of Kaptſchak, which, from the time of its ſeparation in 1441, has had its principal ſeat in the plain, which is now called the Aſtrachan-ſteppe, fell firſt. So long ago as the year 1506, it loſt its laſt khan, and was divided among the ſovereigns of Kazan, Aſtrachan, and the Krim, on which at length it came to Ruſſia by the conqueſt of the two former ſtates. Theſe repeated ſubjugations had reduced the Kaptſchak Tartars to an inſignificant reſidue, which, now removed from its ancient homeſtead, dwells among Baſchkirs and Kirghiſes, though ſtill retaining its appellation, and the memory of its origin. Tooke.

KAR, a town of Perſia, in the province of Irak; 156 miles N. of Iſpahan.

KARA, a river of Ruſſia, which runs into the Karſkoi ſea, at Karſkoi.—Alſo, a town of Hindooſtan, in Guzerat; 60 miles S.W. of Gogo.—Alſo, a town of Hindooſtan, in Berar; 8 miles N. of Chanda.

KARA-AGATZ, a town of European Turkey, in Romania; 6 miles S. of Adrianople.

KARA-BAGAN, a town of Aſiatic Turkey, in Natolia; 24 miles S. of Milets.

KARABAGH, or the *Black Garden*, a mountainous province of the principality of Georgia, ſouth of the river Aras.

KARABAS, a mountain of Grand Bucharia; 50 miles N. [illegible] of Samarcand.—Alſo, a town of Perſia, in the province of Irak; 70 miles S.S.W. of Hamadan.

KARABASAR, a town of Ruſſia, in the government of Tauris; 35 miles N.E. of Bagtſeray.

KARABAZARI, a town of Aſiatic Turkey, in Natolia; 20 miles W. of Kiangari.

KARABE. See CARABE.

KARABEI-SHEH, in *Geography*, a town of Perſia, in the province of Mazanderan, on the coaſt of the Caſpian ſea; 60 miles E. of Fehrabad.

KARA-BIGNAR, a town of Aſiatic Turkey, in Caramania; 20 miles S. of Akſerai.

KARABIOW, a town of Poland, in Podolia; 12 miles N. of Kaminiec.

KARABOA, a town of Aſiatic Turkey, in Natolia; 24 miles W. of Artaki.

KARABOGAS, a bay on the E. ſide of the Caſpian ſea, 40 miles long and 25 broad, the water of which is very bitter. N. lat. 41° 45′. E. long. 54° 44′.

KARABOULAKI, a town of Georgia, in the province of Carduel: 45 miles S. of Gori.

KARABUNAR, a town of Aſiatic Turkey, in Caramania; 40 miles E. of Cogni.

KARAC, a town of Arabia Petræa, on the river Saſia; 90 miles S. of Jeruſalem. N. lat. 30° 44′. E. long. 35° 45′.

KARACAL, or CARACALLA, a town of Walachia; 60 miles S.W. of Buchareſt.

KARACUZ, a town of Perſian Armenia; 22 miles E.S.E. of Erivan.

KARADERA, a town of Aſiatic Turkey, in Diarbekir; 10 miles S.S.E. of Merdin.

KARADJEHLAR, a town of Aſiatic Turkey, in Natolia; 36 miles S.W. of Caſtamena.

KARADJUK, a town of Natolia; 20 miles S.E. of Degnizlu.

KARADRO, a town of Aſiatic Turkey, in Caramania; 50 miles W.S.W. of Selefké.

KARADSHELAR, a town of Natolia; 40 miles N. of Angura.

KARAEVIAN, a town of Ruſſia, in the government of Perm; 64 miles S.S.W. of Ekaterinograd.

KARAGANSKOI, CAPE, a cape on the E. coaſt of the Caſpian ſea. N. lat. 44° 20′.

KARAGINSKOI, an iſland in the N. Pacific ocean, near the N.E. coaſt of Kamtſchatka, about 80 miles in circumference. N. lat. 59°. E. long. 162° 14′.

KARAGODE, a town of the iſland of Ceylon; 86 miles S. of Candy.

KARAGOL, a town of Grand Bucharia, ſeated on a lake; 24 miles S.W. of Bucharia.

KARAH, a town of Arabia, in the province of Nedsjed; 300 miles E. of Mecca.

KARAHAUM, a town of Bengal; 13 miles N.W. of Toree.

KARAHISSAR, a town of Aſiatic Turkey, in Caramania; 38 miles S. of Yurcup. See APHIOM, &c.

KARA-HOTUN, a town of Tartary, in the country of the Monguls; 120 miles N.W. of Peking. N. lat. 41° 16′. E. long. 121 53′.

KARAJIN, a town of Poland, in the palatinate of Braclaw, near the Bog; 50 miles S.E. of Braclaw.

KARAIS, a town of Sweden, in the province of Savolax; 35 miles N.N.W. of Nyſlot.

KARAITES. See CARAITES.

KARAKAJI, in *Geography*, a town of Georgia, in the province of Kaket; 80 miles S.E. of Teflis.

KARAKAKOOA BAY, a bay on the W. ſide of the iſland of Owhyhee, one of the Sandwich iſlands, ſituated in a diſtrict called Akona. It is about a mile in depth, and bounded by two low points of land, at the diſtance of half a league, and bearing S.S.E. and N.N.W. from each other. On the N. point, which is flat and barren, ſtands the village of Kowrowa; and in the bottom of the bay, near a grove of tall cocoa-nut trees, there is another village of a more conſiderable ſize, called Kakooa; between them runs a high rocky cliff, inacceſſible from the ſea-ſhore. On the S. ſide, the coaſt, for about a mile inland, has a rugged appearance; beyond which the country riſes with a gradual aſcent, and is overſpread with cultivated incloſures, and groves of cocoa-nut-trees, where the habitations of the natives are ſcattered in great numbers. The ſhore, all round the bay, is covered with a black coral rock, which makes the landing very dangerous in rough weather, except at the village of Kakooa, where is a fine ſandy beach, with a "morai," or burying-place, at one extremity, and a ſmall well of freſh water at the other. This bay, appearing to Capt. Cook a proper place to refit the ſhips, and lay in a freſh ſupply of water and proviſions, he cauſed them to move on the N. ſide, about ¼ of a mile from the ſhore, Kowrowa bearing N.W. This was in January 1779. The natives came from the ſhore in aſtoniſhing numbers, and expreſſed their joy by ſinging and ſhouting, and exhibiting a variety of wild and extravagant geſtures. Capt. Cook was received by the chiefs of the iſland with a reſpect, approaching to adoration; and the natives, though they manifeſted a propenſity to pilfering, treated him and his companions with a great degree of hoſpitality. On the 4th of February, the ſhips unmoored and failed out of the bay, being followed on their departure by a great number of canoes. It was the deſign of Capt. Cook to finiſh the ſurvey of this iſland before he viſited the other iſlands, in hopes of finding a road better ſheltered than the bay which was now left. But the weather becoming ſqually and tempeſtuous, it was found neceſſary to return to this bay; where the natives manifeſted a very different diſpoſition from that which they had diſcovered on the firſt viſit. They now appeared hoſtile, and adverſe to every exerciſe of hoſpitality. Several circumſtances occurred, which ſerved to widen the breach between the iſlanders and Capt. Cook; and it was found neceſſary to recur to the uſe of arms. For ſubſequent particulars, and an account of the unfortunate death of the commander, ſee his biographical article.

KARAKALPAKS, a tribe of Tartars ſettled in Ruſſia, who called themſelves Kara-Kiptſchaks, and inhabit the diſtricts on the Syr Darya, a conſiderable river ſpringing from the lake Aral. They divide themſelves, according to their poſition, into the upper and the nether horde. Previous to the origin of the Kazanian khanate (ſee KAZAN), they removed to the Volga; where, preſſed by the Nogays, they marched like the Chivinſes, not as other nations did to the weſt, but back towards the eaſt, into their preſent ſeats. About the year 1742 the nether horde, then conſiſting of 30,000 kibitkas, implored the Ruſſian protection; but the Kirghiſes, againſt whom they were deſirous of ſecuring themſelves, took ſuch ſanguinary vengeance, that the greater part of them was exterminated, and thoſe who remained were obliged to return to the upper horde. As they ſeldom have the courage to flee from the Kirghiſian captivity, their number in Ruſſia is very ſmall. Tooke's Ruſſ. Emp. vol. i.

KARAKAN, a town of Curdiſtan; 10 miles S.W. of Betlis.

KARAKECHIS, a town of Perſian Armenia; 48 miles N.E. of Erivan.

KARAKERMAN, a town of European Turkey, in Bulgaria; 36 miles S.S.E. of Iſmail. N. lat. 44° 45′. E. long. 29° 58′.

KARAKITA, a ſmall iſland in the Eaſt Indian ſea, belonging to the king of Ternate. N. lat. 3° 6′. E. long. 125 24′.

KARAKUM, or the *Black Sand*, the name of a great deſert, which forms the northern boundary of Khoraſan and modern Perſia.

KARAKURODY, a town of Perſia, in the province of Schirvan; 20 miles S. of Scamachie.

KARALANSKA, a town of Ruſſia, in the government of Irkutſk, on the Tunguſka; 72 miles N.W. of Ilimſk.

KARALEIJANGO, a town of Africa, in Kaarta. N. lat. 14° 20′. W. long. 6° 20′.

KARALUKALA, a town of Turkiſh Armenia, in the government of Erzerum; 30 miles E. of Erzerum.

KARAMAN, a town of European Turkey, in Bulgaria; 35 miles E.S.E. of Nicopoli.

KARAMEISCHEVO, a town of Ruſſia, in the government of Tver; 72 miles N. of Tver.

KARAMIT, a town of Natolia; 30 miles E.S.E. of Macri.

KARAMUSAH, a town of Natolia, on a bay of the ſea of Marmora; 36 miles N.N.E. of Burſa.

KARAN, a town of Africa, in Benin, in which is a manufacture of fine cloth.

KARANKALLA, a town of Africa, in Kaarta; 10 miles W. of Kemmoo.

KARANSEBES, a town of Hungary, on the Temis; 38 miles E.S.E. of Temiſwar.

KARASBAG, a town of Perſian Armenia; 174 miles E.S.E. of Erivan.

KARASM, or CHARASM, a country of Aſia, bounded on the N. by Turkeſtan, on the E. by Grand Bucharia, on the S. by Khoraſan, and on the W. by the Caſpian ſea; about 320 miles from N. to S. and about as much from E. to W. The country is in general fertile, and is divided among ſeveral Tartarian princes, one of whom takes the title of khan, aſſuming pre-eminence over the reſt. The capital is Urkonje, which is the uſual reſidence of the khan in winter; but in ſummer he uſually encamps on the ſides of the river Amol; his camp being called Khiva. He is ſaid to be able to raiſe forty or fifty thouſand horſemen. This country was formerly full of cities, towns, and caſtles, ſtrong and populous: it was then a province of the Perſian and Arabian empires; but it was probably moſt flouriſhing, when it ſubſiſted as an independent kingdom, under the family of the Kharaſm khans, who by conqueſt annexed to it the whole of Iran, or Perſia at large, and Turan, or the countries N. of the Gihon or Amu, thus forming a great empire, of which Urkonje was the capital. At preſent its cities are few, and much reduced by the deſolating power of the Uſbecks, who have introduced poverty and diſtreſs wherever they have ſettled.

KARASU, a town of Aſiatic Turkey, in Caramania; 100 miles S.E. of Yurcup.—Alſo, a river of Perſia, called *Karanſu*, which riſes in the N.W. part of the province of Irak, and runs into the Tigris, near Baſſorah, anciently called *Eulæus* and *Choaſpes*.—Alſo, a river of Aſiatic Turkey, called *Koremoz*, which riſes near Kaiſarieh in Caramania, and runs into the Euphrates near Ilija.

KARAT, a town of Arabia, in the province of Oman; 190 miles S.W. of Maſcat.

KARAT. See CARAT.

KARATA, by ſome called *caraguata maca*, a kind of aloe growing in America; whoſe leaves, when boiled, are made into a thread, of good uſe for making cloth, fiſhing nets, &c. Its roots or leaves, thrown into the water, ſtupify the fiſhes to that degree, that they are eaſily taken with the hand; its ſtalk, when dried aud burnt, ſerves for tinder; and when briſkly rubbed on a harder wood, it takes fire, and conſumes itſelf.

KARATAS, in *Botany*, Plum. Gen. 10. t. 33, the Weſt Indian name of a fine plant referred by Linnæus to *Bromelia*; ſee that article, ſp. 2.

KARATCHIN, in *Geography*, a Ruſſian oſtrog, in the peninſula of Kamtſchatka; fifty miles from Bolcheretſkoi. It is pleaſantly ſituated by the ſide of the river Awatſka, and conſiſts of three log-houſes, three jourts, or houſes made under ground, and nineteen balagans, or ſummer habitations. The inhabitants are a ſingularly hoſpitable people.

KARATOPE, a town of Hami, in Chineſe Tartary; 30 miles W. of Hami.

KARAT-SIRIM, a town of Curdiſtan; 40 miles S.E. of Kerkuk.

KARATUIN, a town of Perſia, in the province of Irak; 40 miles N.E. of Nehavend.

KARAULNOI, a town of Ruſſia, in the government of Kolivan, on the Geniſei; 60 miles S. of Kraſnoiarſk.

KARAVUN, a town of Hindooſtan, in Dooab; 40 miles W. of Pattiary.

KARBENING, a town of Sweden, in Weſtmannland; 30 miles N. of Stroemſholm.

KARBY, a town of Sweden, in Weſt Bothnia; 20 miles N. of Lulea.

KARCARA, a town of Perſia, in Segeſtan; 70 miles N.W. of Zareng.

KARCOJA, a town of Perſia, in Segeſtan; 21 miles N.W. of Zareng.

KARCZOW, a town of the duchy of Warſaw; 16 miles S.W. of Czerſk.

KARDAMA, in *Hindoo Mythology*, a being ſometimes ſaid to have been an *avatara* or incarnation of the god Siva, and to have been produced by Brahma's ſhadow; ſometimes he is ſaid to be one of the Riſhis. See RISHI.

KARDANAH, in *Geography*. See BELUS.

KARDGHA, the name of a ſhort ſword held in the hand of Hindoo deities of avenging character; the ſacrifical weapon.

KARDUH, in *Geography*, a town of Perſia, in the province of Kerman; 56 miles N. of Maſtih.

KAREDJUK, a town of Aſiatic Turkey, in Natolia; 20 miles S.S.W. of Degnizla.

KAREK, a town of Perſia, in Segeſtan; 30 miles S. of Fuſheng.

KAREK, a town of Perſia, in the province of Lariſtan; 42 miles S. of Lar.

KAREK, or GARAK, an iſland ſituated on the E. coaſt of the Perſian gulf, between Abu Scheehr and Bender Rigk, containing only a ſingle village; but appearing, from its aqueducts cut in the rocks, to have been formerly more populous in proportion to its extent, which is about five leagues in circumference. The Dutch, who once had a ſettlement here, made the iſland famous, by carrying on a great trade from hence to Baſſora, under the direction of baron Kniphauſen. But Mir Mahenna, prince of Bender Rigk, having made an unſucceſsful attempt upon the iſland, at length concluded a peace with the Dutch governor, who was the ſecond in ſucceſſion to Kniphauſen, and the Dutch trade for ſome time met with no interruption. At a ſubſequent period Mir Mahenna made a deſcent upon Karek, and beſieged the town. The Arab, having outwitted Van Houting, the Dutch governor, entered the fort with a ſmall retinue, in order to ſettle terms of accommodation; and having made the Dutch garriſon priſoners, ſent them to Batavia.

via. This event happened in the end of December 1765. Veſſels ſailing to Baſſorah generally touch at this iſland for a pilot. N. lat. 29° 15′. E. long. 50° 26′.

KAREMPI, Cape, *Karempibaran*, or *Cape Piſello*, a cape on the coaſt of Natolia, in the Black ſea. N. lat. 42° 20′. E. long. 33° 10′.

KARENDAR, a town of Perſia, in the province of Khoraſan; 210 miles N. of Herat.

KAREPOS, a town of Ruſſia, in the government of Archangel; 60 miles N.E. of Archangel.

KAREVON, a town of Perſia, in Farſiſtan; 35 miles N.E. of Paſa.

KAREZIN, a town of Perſia, in Farſiſtan; 60 miles S.E. of Bender Rigk.

KARFE, a kind of cinnamon.

KARGALDZIN, in *Geography*, a lake of Ruſſian Tartary, 60 miles in circuit; 340 miles S. of Orenburg.

KARGAPOL, a town of Ruſſia, on the N. ſide of the lake Latcha. N. lat. 61° 30′. E. long. 38° 50′.

KARGHERD, a town of Perſia, in the province of Khoraſan; 16 miles N.W. of Fuſheng.

KARGHERON, a town of Perſia, in the province of Ghilan; 60 miles N.N.W. of Reſhd.

KARGHI, a town of Aſiatic Turkey, in Natolia; 27 miles N.E. of Kiangari.

KARGINIGI, a town of Ruſſia, in the government of Olonetz; 32 miles W. of Vitegra.

KARGO, a province of Africa, in the kingdom of Loango, famous for its mines of excellent copper.

KARIADEH, a town of Natolia, in the gulf of Smyrna; 18 miles W. of Smyrna.

KARJALA, a town of Sweden, in the government of Abo; 23 miles N. of Abo.

KARIATAIN, a town of Arabia, in the province of Nedsjed, anciently Kirjathjearim; 300 miles E. of Medina.

KARIATEIN, a town of the deſert of Syria; 60 miles S. W. of Palmyra.

KARIBAZARI, a town of Natolia; 18 miles W. of Kiangari.

KARIKAL, or Carical, a town of Hindooſtan, on the coaſt of the kingdom of Tanjore, ſituated on one of the branches of the Cauvery; ceded by the king of Tanjore to the French. It contains five moſques, 14 pagodas, and about 500 inhabitants. It was taken by the Engliſh in 1760, and retaken in 1779; ſix miles S. of Tranquebar.

KARINAIS, a town of Sweden, in the government of Abo; 20 miles N.E. of Abo.

KARINKULA, a town of Africa, in Bambouk. N. lat. 13° 36′. W. long. 9° 50′.

KARIS, a town of Sweden, in the province of Nyland; 10 miles N.N.E. of Eknas.

KARISTOJO, a town of Sweden, in Nyland; 16 miles N.N.E. of Eknas.

KARK, a town of the Arabian Irak, on the Tigris; 80 miles N.N.W. of Bagdad.

KARKA, a town of Aſiatic Turkey, in the government of Sivas; 30 miles S. of Tocat.

KARKARLANG, a ſmall iſland in the Pacific ocean, belonging to a cluſter called Meanges. N. lat. 4° 45′. E. long. 126° 59′.

KARKI, an iſland in the Mediterranean; ſix miles W. of Rhodes. N. lat. 37° 25′. E. long. 27° 19′.

KARKOLA, a town of Sweden, in Tavaſtland; 27 miles E. of Tavaſthus.

KARKRONY, a building where the royal manufactures of Perſia are carried on. Here are made their tapeſtries, cloth of gold, ſilk, wool, and brocades, velvets, taffeties, coats of mail, ſabres, bows, arrows, and other arms. There are alſo in it painters in miniature, goldſmiths, lapidaries, &c.

KARKU, in *Geography*, a town of Sweden, in North Finland; 35 miles S.E. of Biorneberg.

KARLANDA, a town of Sweden, in Warmeland; 42 miles W.N.W. of Carlſtadt.

KARLE, a Saxon word, uſed in our laws, ſometimes ſimply for a *man*, and ſometimes for a *ſervant* or *clown*.

Hence the Saxons call a ſeaman a *buſcarle*, and a domeſtic ſervant a *huſcarle*.

Karle *Hemp*, a term uſed by our country people for the latter green hemp.

KARLEBY, Gamla, in *Geography*, a ſeaport town of Sweden, in Eaſt Bothnia, with a good harbour. It trades principally in hemp, ſalt, and ſhip building; 60 miles S.W. of Cajana. N. lat. 63° 50′. E. long. 23° 1′.

Karleby, *Ny*, a town of Sweden, in Eaſt Bothnia, ſeated on the river Lappojock, about five miles from the ſea, built in 1620 by Guſtavus Adolphus; 70 miles S.W. of Cajana. N. lat. 63° 32′. E. long. 22° 26′.

KARLUTZKA, a town of Ruſſia, in the government of Irkutſk; eight miles E. of Niznei Udinſk.

KARLY, a village ſituated on the road between Bombay and Poona, having in its vicinity a lofty hill, in which are ſome excavations that have not, until within theſe few years, come under the notice of Europeans. The hill is named Ekvera, and is two or three miles to the N.E. of Karly, but the excavations are generally called by the name of the village. The late Mr. Wales, a very reſpectable artiſt, was the firſt European who explored this magnificent cavern-temple, of which he made ſeveral accurate ſketches, and copied ſeveral inſcriptions. The ſketches have not been publiſhed, nor have, we believe, the inſcriptions been hitherto explained. Lord Valentia has more recently viſited Karly, and in his "Travels" deſcribes the cave, of which a beautiful view and a ground plan are given; and Mr. Salt, who accompanied his lordſhip, has, in his elegant ſeries of oriental views, given two of this beautiful temple. Major Moor, who has alſo frequently viſited it, has given a plate of ſome of its ſculptures in his Hindoo Pantheon. There are many apartments ſcooped out of the rock in an elevated ſituation, having flat tops, as uſual in moſt of the Indian excavations; but the grand apartment of Ekvera is arched, and of a moſt ſtriking and magnificent deſcription. "Its ſize, and the peculiarity of its form," ſays lord Valentia, "ſtruck me with the greateſt aſtoniſhment. It conſiſts of a veſtibule of an oblong ſquare ſhape, divided from the temple itſelf, which is arched and ſupported by pillars. The length of the whole is one hundred and twenty-ſix feet, the breadth forty-ſix feet. No figures of any deities are to be found within the pagoda, but the walls of the veſtibule are covered with carvings, in alto-relievo, of elephants, of human figures of both ſexes, and of Budha, who is repreſented in ſome places as ſitting croſs-legged, in others he is erect, and in all attended by figures in the act of adoration; and in one place, two figures ſtanding on the lotus are fanning him, while others hold a rich crown over his head. I think, therefore, that it is beyond diſpute, that the whole was dedicated to Budha." Travels, vol. ii. p. 163. (See Boodh.) The farther end of the cave is round, the ſides ſtraight; a row of pillars, ten feet from the ſides, ſupport kneeling elephants, on which are ſeated human figures, all beautifully ſculptured. From a cornice, running the whole length of the temple over the heads of the figures, ſpring ribs of wood forming an arch, and touching in its whole concavity the roof which they ſeem to ſupport. This is a ſingularity not known to exiſt elſewhere. The wooden ribs are not more than three feet apart, and about two in depth, and nine inches thick, and have ſomething the appearance of a ſhip's bottom, inverted. They run parallel to each other, forming a fine arch, from ſide to ſide of the apartment. The pillars are ſixteen in number on each ſide, with a ſpace between equal to the diameter of their ball, *viz.* about four feet. The pedeſtals are ſquare, the ſhafts polygonal. Seven plainer columns continue the line at the end: on them reſts an architrave, whence an arch ſprings inwards, forming a roof over the altar, as it may be called, which in the Hindoo Pantheon is ſaid to "conſiſt of a vaſt hemiſphere of ſtone, reſting on a round pedeſtal of greater diameter, and having its convexity ſurmounted by a ſort of canopy or umbrella of peculiar conſtruction. The principal arched temple of Kenera is exactly on the ſame plan of that here deſcribed, and the altar is alike in both. That at Elora, deſcribed by ſir Charles Malet, in vol. vi. of the Aſiatic Reſearches, is alſo exactly ſimilar in reſpect to ground plan, but the principal object is different, being Budha himſelf, with the ſemi-globe on the round pedeſtal behind him. In neither of theſe three arched caves will, I think, be found any ſculptures referring to the gods of the Brahmans; and theſe three are the only caves that I ever ſaw or heard of conſtructed with an arched roof. And I preſume to hazard an opinion that they are of modern origin, relatively with other excavations at Ellora and on Elephanta, containing, with and without Budha, many of the deities now worſhipped by the Brahmans.

"What I would hence infer is, that in the older ſculptures we find Budha mixed with the other Hindoo gods: Elephanta and the flat-roofed Pantheiſtic temples at Ellora, I reckon among the oldeſt. In ſculptures more modern, Budha, as a deity, is often ſeen excluſively pourtrayed; the arched caves of Ellora, Karly, and Kenera, I judge to be of later date; and as to form and proportion, of more refined and elegant conſtruction. May we not be allowed, from theſe premiſes, to deduce a farther confirmation of the idea that the Budha incarnation of Viſhnu, and the ſectarial deity of that name, excluſively worſhipped by ſo many different nations under ſo many different forms and deſignations, are one and the ſame perſon? and that ſuch excluſive worſhip, and its accompanying ceremonies and privations, is a hereſy or reformation, or whatever it may be termed, of the more ancient Brahminical religion? Among European as well as Indian enquirers, this opinion will find the moſt numerous, but, like other majorities, not the moſt zealous ſupporters.

"Sir Charles Malet's plate of Ellora gives exactly a repreſentation of the temples of Karly and Kenerah as far as regard ground-plan and general deſign; and they muſt certainly have originated in the ſame perſon, as one has been taken from the other. The capitals of the interior pillars, from which the arched roofs ſpring, are different: at Ellora they appear to be men in the act of adoration; at Karly the entablatures are elegantly formed of figures of men and women ſeated on kneeling elephants, whoſe proboſci, joining at the angles, form, in graceful curves, the volutes of the capitals." P. 245.

In Mr. Daniel's publications of oriental ſcenery, unrivalled in elegance by any production of the Britiſh preſs, are a ſeries of views of Ellora, finiſhed from the ſketches of Mr. Wales. To theſe we refer ſuch as deſire a faithful picture of theſe truly wonderful excavations, of which ſome account occurs in an earlier volume, under the article ELLORA. See alſo ELEPHANTA, (in which article we will here notice an error in the ancient and native name of this curious and intereſting iſland, which is Ghari-puri, or Gari-pouri, and not, as miſprinted, Gari-pouli,) and KENERA for ſome farther particulars of the cavern-temples of India.

KARM, an iſland in the North ſea, about 12 miles long, and two wide, near the coaſt of Norway. N. lat. 59° 17′. E. long. 5° 32′.

KARMALA, in *Hindoo Mythology*, a ſervant or miniſter of Yama, the judge of departed ſpirits. See YAMA.

KARMELIS, in *Geography*, a town of Curdiſtan; 12 miles E. of Moſul.

KARMATIANS, an Eaſtern ſect which bore an inveterate malice againſt the Mahometans, and began to raiſe diſturbances in the year of the Hegira 278. It is ſaid to have originated with a poor perſon, called Karmata, who came from Chuſiſtan, in Perſia, to the villages near Cufa, and there feigned great ſtrictneſs and ſanctity; alleging that God had enjoined him to pray fifty times a day, and pretending to invite people to the obedience of a certain Imam of the family of Mahomet. This courſe he purſued till he had formed a great party, out of which he choſe twelve as his apoſtles, to govern the reſt, and to propagate his doctrines. But as his doctrines promoted idleneſs, particularly among the huſbandmen and peaſants, he was ſeized by the governor of the province, impriſoned, and menaced with death. But this menace having been overheard by a girl, who was one of the governor's domeſtics, ſhe took the key of the dungeon from under her maſter's pillow whilſt he was aſleep, releaſed the priſoner, and returned the key to the place where ſhe had found it. On the following morning, when the fact was known, his adherents announced that God had taken him into heaven. He afterwards appeared in another province, declaring to his followers, that it was not in the power of any one to hurt him: at length, however, his reſolution failed him, and he retired into Syria, and was not heard of any more. His ſect continued, and it was pretended that he was a true prophet, and that he had left them a new law, which changed the ceremonies and form of prayer uſed by the Moſlems, having introduced a new faſt, having allowed them to drink wine, and having diſpenſed with the obligation of ſeveral precepts of the Koran. The precepts of this ſacred book they interpreted allegorically. From the year above-mentioned, the Karmatians, under ſeveral leaders, gave almoſt continual diſturbance to the Caliphs and their Mahometan ſubjects for ſeveral years, committing great outrages in Chaldea, Arabia, Syria, and Meſopotamia; and at length eſtabliſhing a conſiderable principality, which attained its height of eminence and power in the reign of Abu Dhâher, famous for the capture of Mecca, and the indignities offered by him to its temple; but it ſoon after declined and came to nothing. The Iſmaelians of Aſia reſembled the Karmatians, if they were not a branch of them. Theſe Iſmaelians, in 483, poſſeſſed themſelves of Al Jebâl, in the Perſian Irak, under the conduct of Haſan Sabah; and this prince, with his deſcendants, enjoyed the ſame for 171 years, till the whole race of them was deſtroyed by Holagu the Tartar. D'Herbelot. Sale's Koran.

KARMIN, in *Geography*, a town of Perſia, in Segeſtan; 25 miles N.E. of Zareng.

KARMOE, a ſmall iſland in the North ſea, near the coaſt of Norway. N. lat. 59 10′.

KARMSUND, a ſtrait in the North ſea, between the iſland of Carmen and the coaſt of Norway.

KARMUK, a town of Curdiſtan, on the ſide of the lake Van; 22 miles N.N.E. of Betlis.

KARNAC. See CARNAC.

KARNE, a town of Africa, in the kingdom of Bornou.

KARNICAR, a town of Grand Bucharia; 20 miles N. E. of Termed.

KARNKOWSKI, STANISLAUS, in *Biography*, celebrated as a Poliſh writer and ſtateſman, was born in 1525. He was educated for the church, and obtained a biſhopric about the year 1563, and upon the death of Sigiſmund Auguſtus, king of Poland, in 1572, he promoted the election of Henry of Valois, and, on his reception, made an eloquent harangue to him in the name of the ſtates. After the abdication of this prince, Karnkowſki nominated Anne, the ſiſter of the late Sigiſmund, queen of Poland, and crowned her huſband, Stephen Battori, upon the refuſal of the primate to perform this office. After this he placed the crown on the head of Sigiſmund III. prince of Sweden, who was acknowledged by the kingdom. He had already ſucceeded to the primacy, and, in 1590, he joined a party who were in oppoſition to the great chancellor, Zamoiſky, and convoked an extraordinary aſſembly at Kiow, in which he endeavoured to cancel the ordinances of the laſt diet. This ſtep rendering him unpopular, he was obliged to ſeek a reconciliation with the chancellor. He died in 1603, at the age of ſeventy-eight, and was interred in the Jeſuits' college at Kaliſh, which he had founded. As an inſtructor of youth he did much to reform the ſyſtems of education: but as an author he is known by "Hiſtoria Interregni Polonici," being a relation of the affairs of the interregnum ſucceeding the abdication of Henry of Valois: "De Jure Provinciarum, Terrarum, Civitatumque Pruſſiæ:" "Epiſtolæ Illuſtrium Virorum, lib. iii." This collection of letters is very rare, and is ſaid to contain many important particulars relative to the hiſtory of Poland, from 1564 to 1577.

KARNOWL, in *Geography*, a town of Hindooſtan, in Bahar; 38 miles N.N.W. of Hajypour. N. lat. 26° 17'. E. long. 85° 11'.

KAROLI, JASPER, in *Biography*, a Hungarian divine, who flouriſhed towards the cloſe of the ſixteenth century, was held in high eſtimation for his talents as a philoſopher, theologian, and philologiſt, and much admired as a preacher. His memory is greatly revered on account of his having tranſlated the bible from the original Hebrew into his native language. This work was publiſhed at Hanover, in 4to., in the year 1608, and another impreſſion of it was given to the public from the preſs at Frankfort, in 8vo., by Albert Molnar. The work has been reprinted very frequently, in different countries, and is ſtill held in high eſtimation.

KAROLOU-KALA, in *Geography*, a town of Turkiſh Armenia; 42 miles E. of Erzerum.

KAROP, a town of Ruſſia, in the government of Novgorod Sieverſkoi; 28 miles S. of Novgorod Sieverſkoi.

KAROS, an iſland in the Grecian Archipelago, ſix miles in circumference; 6 miles S.E. of Naxia. N. lat. 36° 53'. E. long. 25° 39'.

KAROTTA, a ſmall iſland in the Pacific ocean, belonging to the cluſter called Meanges. N. lat. 5°. E. long. 126° 50'.

KAROULI, a town of European Turkey, in Beſſarabia; 68 miles S.W. of Bender.

KARPILAX, a town of Sweden, in Tavaſtland; 14 miles N.E. of Jamſio.

KARPILOWKA, a town of Poland, in the palatinate of Kiev; 8 miles N.N.W. of Kiev.

KARRIARPOUR, a town of the circar of Gohud; 16 miles N. of Gohud.

KARRIETEN, a town of Arabia, in Yemen; 20 miles S.S.E. of Chamir.

KARROO, a Hottentot name given, in the colony of the Cape of Good Hope, to vaſt plains, which are interpoſed between the great chains of mountains. Out of their impenetrable ſurfaces of clay, gliſtening with ſmall cryſtals of quartz, and condemned to perpetual drought and aridity, not a blade of graſs, and ſcarcely a verdant twig, occurs to break the barren uniformity. The hills, by which theſe ſurfaces are ſometimes broken, are chiefly compoſed of fragments of blue ſlate, or maſſes of feltſpar, and argillaceous ironſtone; and the ſurfaces of theſe are equally denuded of plants as thoſe of the plains. Yet, Mr. Barrow obſerves, that wherever the Karroo plains are tinged with iron, and water can be brought upon them, the ſoil is found to be extremely productive. Barrow's Africa, vol. ii. p. 32.

KARS, a town of Aſiatic Turkey, in Aladulia; 25 miles N N.E. of Adana.—Alſo, a town of Perſia, in the province of Kerman; 20 miles N. of Sirjian. This is the extreme town on the frontiers of Perſia, and though an inconſiderable place, is tolerably fortified.

KARSABOO, a town of Africa, in Bambarra. N. lat. 13° 10'. W. long. 5° 35'.

KARSAMAKI, a town of Sweden, in the government of Ulea; 65 miles S. of Ulea.

KARSEK, an iſland near the weſt coaſt of Eaſt Greenland. N. lat. 60° 35'. W. long. 45° 20'.

KARSHAGNI, a fiery expiation among the Hindoos, of which the following account is taken from Moor's Hindoo Pantheon. "Cow-dung is a great purifier on ſeveral occaſions. It is related in the Agni-purana, that a moſt wicked perſon, named Chanyaka, had exceeded every known poſſibility of ſalvation. At the court of Indra were aſſembled gods and holy men; and as they were diſcourſing on ſuch enormities, Indra, in anſwer to a pointed queſtion, ſaid that nothing certainly could expiate them except the karſhagni. It happened that a crow, named, from her friendly diſpoſition, Mitra-kaka, was preſent; and ſhe immediately flew and imparted the welcome news to the deſpairing ſinner, who immediately performed the karſhagni, and went to heaven. This expiation conſiſts in the victim covering his whole body with a thick coat of cow-dung, which, when dry, is ſet on fire, and conſumes both ſin and ſinner. Until revealed by the crow, this potent expiation was unknown; and it has ſince been occaſionally reſorted to, particularly by the famous Sankara-Charya. The friendly crow was puniſhed for her indiſcretion; and forbidden, and all her tribe, aſcenſion to heaven, and was doomed on earth to live on carrion." P. 143. See SANKARA-CHARYA.

KARSKOI, in *Geography*, a ſettlement of Ruſſia, in the government of Archangel, at the mouth of the Kara; 600 miles E N.E. of Archangel. N. lat. 68° 35'. E. long. 64° 14'.

KARSKOI *Sea*, that part of the Frozen ocean which lies between the continent of Ruſſia and Nova Zembla, extending from N. lat. 70° to 75°, and from E. long. 61° to 68°.

KARSKOI *Gulf*, is a large bay of the Frozen ocean, lying to the ſouth of the Karſkoi ſea. N. lat. 68° to 70°. E. long. 62° to 69°.

KARSTORP, a town of Sweden, in the province of Smaland; 48 miles S.E. of Jonkioping.

KARSTULA, a town of Sweden, in the government of Waſa; 85 miles E. of Waſa.

KARSUN, a town of Ruſſia, in the government of Simbirſk; 60 miles W.S.W. of Simbirſk.

KARSURUSK, a town of Eaſt Greenland. N. lat. 61° 10'. W. long. 45°.

KARSYTSIAK, a town of Eaſt Greenland. N. lat. 60° 16'. W. long. 43°.

KARTAL, a town of Aſiatic Turkey, in Natolia, on the coaſt of the ſea of Marmora; 40 miles W. of Iſmid.

KARTAN, or Martan, four ſmall iſlands in the Arabian ſea, at the entrance of the gulf of Curia Muria, bounding it on the S.W. N. lat. 17° 30′. E. long. 54° 50′.

KARTASCHEN, a town of Ruſſia, in the government of Tobolſk, on the Irtiſch; 48 miles S. of Tara.

KARTBIRT, a town of Aſiatic Turkey, in Diarbekir; 48 miles W.N.W. of Diarbekir.

KARTERON, a town of Syria, on the Euphrates; 10 miles S. of Oſara.

KARTES, a town of Africa, in the country of Whidah; 12 miles E. of Sabi.

KARTIKYA, in *Hindoo Mythology*, the offspring of Siva, whoſe ſeed falling through the hands of Agni, the god of fire, into the Ganges, has given riſe to other names alluſive to his birth, of a very extravagant nature if taken literally, but which are moſt likely aſtronomical allegories; he is hence called Agni-bhuva, and Ganga-putra. Kumara, Srimana, and Skanda are others of his names. He aroſe, ſay the Puranic legends, on the banks of the Ganges, as bright as the ſun, and beautiful as the moon; and it happening that ſix daughters of as many rajas going to bathe, ſaw the boy; and each calling him her ſon, and offering the breaſt, the child aſſumed ſix mouths, and received nurture from all, whence he was called Seſhti-matriya, that is, having *ſix mothers*. Other legends relate, that on the birth of the child he was delivered to the Pleiads to be nurſed. The Hindoos reckon but ſix bright ſtars in that conſtellation, which is named *Kritika*. Theſe ſix offering their breaſts, "the ſix-headed was nurtured, and named Kartikya, the deſcendant of the Kritikas." See Kritika.

He is, however, generally eſteemed the ſecond ſon of Siva and Parvati, the god of war, and commander of the celeſtial armies, and ſir William Jones, who ſpells his name Carticeya, deems him to be clearly the Orus of Egypt and the Mars of Italy; and was convinced that the name Skanda, by which he is called in the Puranas, has ſome connection with the old Sekander of Perſia, whom the poets ridiculouſly confound with the Macedonian. He is uſually repreſented with ſix heads and ſix arms, and ſometimes mounted on a peacock. Several plates of him are given in Moor's Hindoo Pantheon; where, and in Aſ. Reſ. vol. i. and Maurice's An. Hiſt. are many particulars of this warlike deity, from Puranic legends and other authorities. His ſakti, or conſort, is always called Kaumari, after his name of Kumara.

KARTUNSAI, in *Geography*, a ſmall iſland in the gulf of Finland. N. lat. 60° 30′. E. long. 27°.

KARTUSH, a town of Turkiſh Armenia, in the government of Cars; 52 miles N.E. of Ardanoudji.

KARTUTA, a town of Sweden, in the government of Kuopio; 20 miles W. of Kuopio.

KARVIA, a town of Sweden; in the government of Abo; 47 miles N.N.E. of Biorneborg.

KARUN, a town of Perſia, in the province of Chuſiſtan; 70 miles S. of Suſter.

KARUNA, a town of Sweden, in the government of Abo; 13 miles S.S.E. of Abo.

KARUP, a town of Denmark, in North Jutland; 14 miles N.W. of Aalborg.—Alſo, a town of Sweden, in the province of Halland; 15 miles S. of Halmſtadt.

KARZALA, a town of Ruſſia, in the government of Saratov, on the Choper; 80 miles N.W. of Saratov.

KAS, or Guess, called alſo *Kyen* and *Queſche*, a low fertile iſland in the gulf of Perſia, ſeparated from the continent of Perſia by a good channel about 12 miles broad. N. lat. 26° 34′. E. long. 54° 4′.

Kas, *El*, or *Kas Kaſaron*, a mountainous cape of Egypt. on the coaſt of the Mediterranean; 3 miles N. of Catieh. N. lat. 30° 58′. E. long. 33° 22′.

KASABI, a town of Syria, on the Euphrates; 25 miles E. of El Der.

KASAKURA, a town of Japan, in the iſland of Ximo; 22 miles E.S.E. of Taiſero.

KASAN. See Kazan.

KASBAITE, or Gasbaite, a town of Algiers, anciently called *Satafa*; 50 miles S.W. of Conſtantina.

KASCHAN. See Cashan.

KASHGAR. See Cashgar.

KASCHIL, a town of Africa, in the kingdom of Benguela.

KASCHIN, a town of Ruſſia, in the government of Tver; 60 miles N.E. of Tver.

KASCHIRA, a town of Ruſſia, in the government of Tula; 56 miles N. of Tula.

KASCHKARANTZI, a town of Ruſſia, in the government of Archangel, on the White ſea; 140 miles N.W. of Archangel.

KASHAKLU, a town of Aſiatic Turkey, in Caramania; 55 miles S.W. of Cogni.

KASHAN. See Cashan.

KASHEKA, in the hiſtoric legends of the *Hindoos*, is the father of a very renowned aſcetic and ſage named *Viſwavitra*; which ſee.

KASHMIR, in *Geography*. See Cashmire.

KASI, or Kassi, ſometimes written *Kaſhi*; a Sanſcrit name of the revered city of Benares; the latter popular name being probably a corruption of its claſſical appellation Vara-nari, ſo called from two rivers that form a junction of waters and name near its ſcite. See Benares.

Kasi, a term in the Eaſt, applied to the fourth pontiff of Perſia, who is alſo the ſecond lieutenant civil, and judges of temporal as well as ſpiritual affairs.

He has two deputies, who determine matters of leſs conſequence; particularly quarrels ariſing in coffee-houſes, which make a great part of their buſineſs.

KASILAX, in *Geography*, a town of Sweden, in the province of Savolax; 29 miles E. of Nyſlot.

KASIMOV, a town of Ruſſia, in the government of Riazan, on the Oka, formerly the reſidence of a Tartar prince; 76 miles E.N.E. of Riazan.

KASKAREL Melik, a town of the Arabian Irak; 36 miles N. of Bagdad.

KASKASKIAS, a poſt-town of America, and the chief of Randolph county, on the S.W. bank of a river of the ſame name, 12 miles from the mouth of the river; containing about 100 houſes, many of which are well built with ſtone; and 467 inhabitants, of whom 47 are ſlaves.—Alſo, an Indian nation near the river of this name in the Indiana territory. In 1774 they could furniſh 250 warriors. Three miles northerly of Kaſkaſkias is a village of Illinois Indians, of the Kaſkaſkias tribe, containing, in 1774, about 210 perſons and 60 warriors. They were formerly brave and warlike, but are now degenerated and debauched. In Auguſt 1803, governor Hamilton concluded a treaty with the Kaſkaſkias Indians, by which they ceded to the United States in full right the immenſe tract of country extending from the mouth of the Illinois river to the mouth of the Ohio; from thence to the mouth of the Saline creek, below the Wabaſh; thence bounded by the highlands, dividing the waters which run into the Wabaſh from thoſe which run into the Saline creek; thence by the highlands dividing the waters which run into the Wabaſh from thoſe which run into the Miſſiſippi, until it reaches the river Kaſkaſkia; thence, by the highlands, which divide the waters that fall into the Kaſkaſkia river from thoſe which fall into the river Illinois, and from thence in a direct courſe to the mouth of the Illinois again; ſuppoſed to contain from 10 to 12 millions of acres. The whole was ceded in conſideration of the annual addition of 500 dollars to a like ſum, which by the treaty of Greenville, the Kaſkaſkia tribe receives every year from the United States, together with the reſervation of 1580 acres near the village of Kaſkaſkia, for cultivation and domeſtic purpoſes. Morſe.—Alſo, a river of the north-weſt territory, which is navigable for boats 130 miles. Its courſe is S.S.W., and near its mouth it turns to the S.S.E. and falls into the Miſſiſippi river, 84 miles from the Illinois. It runs through a rich country, abounding in extenſive natural meadows, and numberleſs herds of buffaloes, deer, &c. Along the eaſt ſide of the river lie high grounds, the banks being compoſed of lime-ſtone and free-ſtone, and from 100 to 130 feet high, divided in many places by deep cavities, through which many ſmall rivulets paſs before they fall into the Miſſiſippi. The ſides of theſe hills fronting the river are in many places perpendicular, and appear like ſolid pieces of maſonry, of various colours, figures, and ſizes. Morſe.

KASKASKUNK, a town of the Delawares, between Great Beaver creek and Alleghany river, in Pennſylvania; 40 miles N. of Pittſburg.

KASKEIRA, a town of Perſia, in the province of Irak; 25 miles N. of Sava.

KASKINOMPA, a ſmall river which runs W. into the Miſſiſippi from Teneſſee, in N. lat. 36° 28′. On the north ſide of its mouth is an iron mine.

KASKIS, a town of Sweden, in Tavaſtland; 30 miles E. of Tavaſthus.

KASKO, a ſmall iſland in the gulf of Bothnia, near the coaſt of Finland. N. lat. 63° 16′. E. long. 90° 10′.

KASKOYAR, a ſmall iſland in the gulf of Bothnia. N. lat. 63° 16′. E. long. 90° 10′.

KASNICH, a town of Perſia, in the province of Khoraſan; 12 miles S. of Zauzan.

KASR, a town of Egypt; 6 miles N.N.W. of Aſhmounein.

Kasr *Ahmed*, a town of Tripoli, on the coaſt; 100 miles E. of Tripoli. N. lat. 32° 4′. E. long. 15° 20′.

Kasr *Kiaſſera*, a town of Egypt, built on the ruins of the ancient Nicopolis, on the coaſt of the Mediterranean; 5 miles N.E. of Alexandria.

KASSAN, a town of Africa, in the kingdom of Yani, on the N. ſide of the Gambia; 36 miles N.W. of Piſania.

KASSAR, an iſland of the Baltic, to the ſouthward of Dago, with a chapel, about 11 verſts long and between four and ſeven verſts broad.

KASSERAMANGALUM, a town of Hindooſtan, in Baramaul; 17 miles S. of Coveriporum.

KASSGUNGE, a town of Hindooſtan, in the Dooab; 24 miles N.W. of Pattiary.

KASSINA, or Cashna, a kingdom of Africa, ſituated N. of the river Niger, between Bornou and Tombuctoo. The two empires of Bornou and Kaſſina extend northwards towards Nubia, and comprehend a very conſiderable ſpace. In both theſe empires, the ſovereigns are Mahometans; but their ſubjects are ſaid more generally to adhere to the ancient worſhip; that is to ſay, the lower orders are, almoſt univerſally, Negroes. Kaſſina, till of late, was eſteemed the firſt in power; but though a thouſand villages and towns are ſtill included in its vaſt domains, this empire is now conſidered much inferior to Bornou. The circumſtances of ſoil and climate, and thoſe alſo which conſtitute political character, are nearly the ſame in both; their prevailing winds are the ſame; their rains, which are periodical in each, though much more profuſe in Bornou, begin at the ſame ſeaſon; the ſame grains are cultivated; the ſame fruits (generally ſpeaking), are produced; and except that no camels are bred to the weſtward of the city of Kaſſina, the capital of the empire, the ſame animals are reared. In both, the complexion of the inhabitants is black; their mode of building too is ſimilar, and their manners, though in ſome reſpects more civilized in Bornou, have a general reſemblance. Each of the two empires is formed by the ſubjection of different tribes or nations to the dominion of one ruling people. The nature of the government, and the laws which regulate its ſucceſſion, are the ſame in both. In both, the ruling people are Mahometans; in both, the dependent nations are compoſed of converts to the Muſſulman faith, and of adherents to the ancient worſhip; and though at preſent their languages are different, the conquerors in both had probably the ſame original. The word Soudan, expreſſing the land of the Blacks, is by the Arabian geographers applied to the Nigritia of European geographers; but ſome Africans reſtrict it to the empire of Caſhna, which is N. of the Niger, and others extend it to the Negro ſtates on the S. of the river; and wiſhing to expreſs the tranſcendent power and extended rule of the emperor of Caſhna, they call him, with extravagant compliment, the ſultan of all Soudan. His real ſovereignty is bounded on the N. by the mountains of Eyré, and by one of thoſe diſtricts of the great Sahara, that furniſh no means of uſeful property or available dominion; on the S. by the Niger; and on the E. by the kingdom of Zamphara, and the empire of Bornou. Its weſtern limit is not aſcertained. There are ſome circumſtances of difference, which, notwithſtanding the general reſemblance between Bornou and Caſhna, diſcriminate between them. The rains are leſs violent in the latter than in the former. Caſhna excluſively furniſhes the Biſhnah, a ſpecies of Indian corn, that differs from the gamphúly in the blended colours of red and white which diſtinguiſh its grain. Its monkies and parrots (animals ſeldom ſeen in Bornou) are numerous, and of various ſpecies. The meridian of its capital is conſidered as a weſtern limit, in that parallel of latitude, to the vegetation of grapes and breeds of camels; for between Caſhna and the Atlantic few camels are bred, and no grapes will grow. The manners of the common people are leſs courteous in Caſhna than in Bornou; and their games are leſs expreſſive of reflection; for their favourite play conſiſts in toſſing up four ſmall ſticks, and counting thoſe that croſs each other, as ſo many points of the number that conſtitutes the game. But the circumſtances of chief diſcrimination between the two empires, are thoſe of language, currency, and certain articles of commerce. Many words occur in one language which are not found in the other. The currency of Caſhna, like that of the Negro ſtates S. of the Niger, is compoſed of thoſe ſmall ſhells called cowries. Of theſe ſhells, 2500 are eſtimated as equal in value to a miktal of Fezzan, which is worth about 75 piaſtres of Tripoli, or 10*s.* 1½*d.* ſterling. Among the few circumſtances which characterize the trade of Caſhna, as diſtinguiſhed from that of Bornou, the moſt remarkable is, that the merchants of the former kingdom are the ſole carriers to other nations, of a ſcarce and moſt valuable commodity, which is only to be obtained from the inhabitants of the latter. For though the ſalt of Bornou ſupplies the conſumption of Caſhna, and of the Negro kingdoms to the ſouth, yet its owners have abandoned to the commercial activity of the merchants of Agadez the whole of that profitable trade. The lakes, on the dreary ſhores of which this ſcarce article of African luxury is found, are ſeparated from Agadez by a march of 45 days, and are encompaſſed on all ſides by the ſands of the vaſt deſart of Bilma, where the ardent heat of a flaming ſky is returned with double fierceneſs by the ſurface of the burning ſoil. A thouſand camels, bred and maintained for the purpoſe, are ſaid to compoſe the caravans which annually explore, in the ſavage wilderneſs, the long line of this adventurous journey. Perilous however, and full of hardſhips as their labour is, the merchants find an ample recompence in the profits of their commerce; for while the wretched villagers who inhabit the neighbourhood of the lakes, and collect the ſalt that congeals upon the ſhores, are contented to receive, or obliged to accept a ſcanty price, the value which the merchants obtain in the various markets of Caſhna, Tombuctoo, and of the countries S. of the Niger, is ſuited to the high eſtimation in which the article is held. The people of Agadez are equally anxious to avail themſelves of the productions of their own country. Accordingly, being well appriſed of the ſuperior quality of the ſenna, which grows upon theſe mountains, they demand and receive from the merchants of Fezzan a proportionable price. From Tripoli this ſenna is conveyed to Turkey, Leghorn, and Marſeilles. Of the other articles of ſale which the extenſive empire of Kaſſina affords, the principal are gold-duſt, ſlaves, cotton cloths, which are the general manufacture of Caſhna, Bornou, and the Negro ſtates S. of the Niger, goat-ſkins of the red and yellow dyes, ox and buffalo hides, and civet; and in return for theſe, the inhabitants of Kaſſina receive cowries, horſes, and mares, red woollen caps, check linens, light coarſe woollen cloths, baize, barakans or alhaiks, ſmall Turkey carpets, plain Meſurata carpets, ſilk, wrought and unwrought, tiſſues and brocades, ſabre blades, Dutch knives, ſciſſors, coral, beads, ſmall looking-glaſſes, tiches, or a paſte prepared in Fezzan, from dates and the meal of Indian corn, and which, whenever they travel, is in great requeſt among the people of Fezzan; and Gooroo nuts, which are brought from the Negro ſtates on the S. of the Niger, and which impart a pleaſant bitter to any liquid in which they are infuſed.

The Fezzaners, equally connected by their commerce with Caſhna and Bornou, diſpatch to the former as well as to the latter, and always at the ſame ſeaſon, an annual caravan. From Mourzouk, their capital, which they leave at the cloſe of October, they take their courſe to the S.S.W. and proceed to the province of Hiatts, the moſt barren, and the worſt inhabited diſtrict of their country. From Hiatts they croſs the low mountains of Eyré, which ſeparate the kingdom of Fezzan from the empire of Caſhna, and next arrive at the town of Ganatt, where they repoſe for two days. From thence, by a march of 19 days, during ſix of which they are expoſed to the ſcorching heats of a thirſty deſart, they paſs on to the town of Aſſouda. On leaving Aſſouda, they traverſe a delightful country, fruitful, and populous; and while the exhilarating ſight of Indian corn, and of frequent herds of cattle accompanies and cheers their paſſage, the eighth day introduces them to the large and populous city of Agadez, the capital of an extenſive province. Diſtinguiſhed as the moſt commercial of all the towns of Caſhna, and, like Aſſouda and Ganatt, inhabited by Mahometans alone, Agadez naturally attracts the peculiar attention of the merchants of Fezzan. Many proceed no farther; but the greateſt part, committing to their agents the care of the ſlaves, cotton, and ſenna, which they purchaſe in the courſe of a 10 days' reſidence, continue their journey to the ſouth. In this manner, if the camels are completely loaded, 47 days, excluſive of thoſe which are allotted to refreſhment and neceſſary reſt, are employed in travelling from Mourzouk to Agadez. At the end of three days more, amidſt fields that are enriched with the luxuriant growth of Indian corn, and paſtures that are covered with multitudes of cows, and with flocks of ſheep and goats, the traveller reaches the ſmall town of Begzam; from which, through a country of herdſmen, whoſe dwellings are in tents of hides; the ſecond day conducts him to the town of Tegomah. There, as he ſurveys the ſtony, uninhabited, deſolate hills that form the cheerleſs proſpect before him, he caſts a regretful eye on thoſe verdant ſcenes that ſurrounded him the day before. Employed for two days in the paſſage of theſe dreary heights, he deſcends on the third to a deep and ſcorching ſand, from which he emerges at the approach of the fifth evening, and entering a beautiful country, as pleaſingly diverſified with the natural beauties of hills and vales and woods, as with the rich rewards of the huſbandman's and the ſhepherd's toil, he arrives in ſeven days more at the city of Caſhna, the capital of the empire of which it bears the name. and the uſual reſidence of its powerful ſultan.

The river Niger traverſes the empire of Caſhna with ſuch rapidity, that no veſſel can aſcend its ſtream; and ſuch is the want of ſkill, and ſuch the abſence of commercial inducements among the inhabitants of its borders, that even *with* the current, neither veſſels nor boats are ſeen to navigate. In one place, indeed, the traveller finds a paſſage for himſelf and his goods; but even there, though the ferrymen, by the indulgence of the ſultan of Caſhna, are exempted from all taxes, the boat which conveys the merchandize is nothing more than an ill-conſtructed raft; for the planks are faſtened to the timbers with ropes, and the ſeams are cloſed, both within and without, by a plaiſter of tough clay. The depth of the river, at the place of paſſage, which is more than 100 miles to the ſouth of the city of Caſhna, is eſtimated at 23 or 24 feet Engliſh. (Proceedings of the African Aſſociation.) The city of Caſhna, or Kaſſina, is diſtant 650 miles W.S.W. from Bornou, and 690 miles E.S.E. from Tombuctoo. N. lat. 16 30'. E. long. 11° 34'.

KASSON, a ſtrong hilly country of Africa, of ſmall extent, bounded on the N. by the Moors of Jaffnoo, on the E. and S.E. by Kaarta, on the S. by the Senegal, and on the W. by Kajaaga; about 50 miles from N. to S., and nearly the ſame from E. to W. N. lat. 14° to 15°. W. long. 8° to 9°.

KASSUTO, an African muſical inſtrument, compoſed of a hollow piece of wood, about an ell long, covered with a plate cut into a kind of ſcale, upon which the negroes beat with a ſtick. See *Muſic of the* Negroes.

KAST, in *Geography*, a town of Perſia, in Segeſtan; 40 miles S.W. of Arokhage.

KASTANOVITZ, a town of Croatia, ſituated on an iſland in the river Unna; 50 miles S.E. of Carlſtadt.

KASTHOLM, a town of Sweden, on the S.E. coaſt of the iſland of Aland.

KASTRICAUR, Cape, a cape on the N.E. coaſt of the Company's iſland, in the North Pacific ocean. N. lat. 46° 30'. E. long 151° 40'.

KASTRIL, in *Zoology*. See Kestril.

KASYA, in *Hindoo Mythological Hiſtory*, was the Guru, or ſpiritual preceptor of Kriſhna, of whoſe wife the following legend occurs in the Pedma Purana, and in the Sri Bhagavat among the ſtrange miracles recorded of this incarnate deity. She complained to Kriſhna that the ocean had ſwallowed up her children on the coaſt of Gurjura, or Guzerat, and ſupplicated their reſtoration. Kriſhna, proceeding to the coaſt, was aſſured by Varuna, the regent of the ocean, that not he, but the ſea-monſter, Sankaſura, had ſtolen the children. Kriſhna fought, and after a violent conflict, ſlew the demon, and tore him from his ſhell, named Panchajanya, which he bore away in memorial of his victory, and uſed afterwards in battle by way of trumpet. (See SANKASURA.) Not finding the children in the dominions of Varuna, he deſcended to the infernal city, Yama-puri, and ſounding his tremendous ſhank, or ſhell, (ſee SHANK,) ſtruck ſuch terror into Yama, that he ran forth to make his proſtrations, and reſtored the children of Kaſya, with whom Kriſhna returned to their delighted mother.

KASYAPA, an important character, who, in different theogonies, aſſumes different lines of parentage and character. In the Siva-purana he is made the great-grandſon of Brahma, Marichi and Bhrigu being his immediate anceſtors: and he is there feigned to have married thirteen of Dakſha's ſixty daughters, an aſtronomical allegory that has not yet been explained; but alluding, we apprehend, to a cycle of ſixty years in all among the Hindoos. Sir William Jones ſuſpected, and Mr. Wilford has proved the whole fable of Kaſyapa to be aſtronomical, and the ſame with the Caſſiopeia of the Greeks. Kaſyapa, in ſome points, correſponds in character with Uranus; Marichi, the offspring of Brahma, being a perſonification of Light. Surya, or the Sun, is ſometimes found mentioned as the ſun or offspring of Kaſyapa, and ſometimes he is included in the liſt of the ſeven Riſhis; in other relations he is the huſband of Diti, and the parent of Indra, Aruna, Garuda, and many of the minor deities. In Viſhnu's avatara of Vamana, or the dwarf, he became incarnate in the perſon of Kaſyapa's ſon, by Aditi; and the Nakſhatras, or lunar manſions, (ſee NAKSHATRA,) are, in the Inſtitutes of Menu, attributed to "Kaſyapa, the firſt production of Brahma's head."

KATABA, in *Geography*, a town of Arabia, in the province of Yemen, ſituated in a fertile country, near a river that runs into the ſea at Aden, governed by a dola, and defended by a citadel; 75 miles N. of Aden. N. lat. 13° 54′. E. long. 44° 39′.

KATAL, a town of Aſiatic Turkey, in the government of Sivas; 18 miles S. of Sivas.

KATAPANG, a ſmall iſland in the Eaſt Indian ſea, near the N. coaſt of Java. S. lat. 7° 39′. E. long. 113° 22′.

KATAREN, a town of Arabia, in the province of Yemen; 60 miles S. of Saade.

KATENIA, a town of Bengal; 80 miles N. of Dacca.

KATEREVI, a town of the principality of Georgia; 18 miles W.S.W. of Teflis.

KATERINENSCHSTAT, a town of Ruſſia, in the government of Saratov, on the Volga; 32 miles N.E. of Saratov.

KATHTIPPACAMUNCK, an Indian village in America, on the N. ſide of Wabaſh river, at the mouth of Rippacanoe creek, and about 20 miles above the Lower Weau towns. In 1791, before its deſtruction by generals Scott and Wilkinſon, it contained 120 houſes, the beſt of which belonged to the French traders. N. lat. 40° 20′. W. long. 87° 2′.

KATIF, a town of Arabia, in the province of Lachſa, of ſome magnitude, ſituated upon the coaſt, at the diſtance of about five German miles from the iſle of Bahhrein. The inhabitants earn their ſubſiſtence by the pearl fiſhery; the ſeaſon for fiſhing is in the hotter months of the year, when the air is deemed to be very inſalubrious.

KATIMBEVOLE, a town of the iſland of Ceylon; 36 miles S. of Candy.

KATIMTUMU, a town of Ruſſia, in the government of Irkutſk, on the Lena; 60 miles E. of Olekminſk.

KATIRLI, a town of Natolia; 28 miles N. of Burſa.

KATISTI, a town of Natolia, on the coaſt of the ſea of Marmora; 36 miles S. of Conſtantinople.

KATKIN. See CATKIN.

KATMANDU, or CATMANDU, in *Geography*, the capital of Napaul or Nepal, in a province of the ſame name; called alſo Jingbu by the people of Thibet. It is placed by Rennell 105 geographical miles nearly N. from Maiſſy, that is, in latitude 28° 6′. It is 536 Britiſh miles from Laſſa, or in horizontal diſtance 346 geographical miles. According to Giuſeppe, it contains about 18,000 houſes, probably yielding a population of 70 or 80 thouſand. (See NEPAUL.) According to colonel Kirkpatrick's account it is ſeated on the eaſtern bank of the Biſhmutty, along which it runs for a mile, with a breadth not exceeding half a mile. The moſt ſtriking objects which it preſents to the eye are its wooden temples, which are ſcattered over its environs, and particularly along the ſides of a quadrangular tank or reſervoir. The colonel ſays, "there are nearly as many temples as houſes, and as many idols as inhabitants." The number of idols, according to his ſtatement, amounts to 2733. Beſides theſe wooden temples, Katmandu contains ſeveral others on a large ſcale, conſtructed of brick, with two or three ſloping roofs, diminiſhing as they aſcend, and terminating in pinnacles, which, as well as ſome of the ſuperior roofs, are ſplendidly gilt, and produce a very pictureſque and agreeable effect. The houſes are of brick and tile, with pitched roofs towards the ſtreet, frequently ſurrounded by wooden balconies, of open carved-work, and of a ſingular faſhion. They are of two, three, or four ſtories, and generally of a mean appearance. The ſtreets are narrow and filthy. Katmandu, with its dependent towns and villages, according to Kirkpatrick, may contain about 22,000 houſes; but the town itſelf, if ten people be allowed to each houſe, which he thinks to be a low computation, does not contain more than 50,000 perſons. The next moſt conſiderable towns of Nepaul are Patn, Bhetgong, and *Khirtipoor*. Aſiatic Ref. vol. ii. p. 307.

KATNA, a town of Sweden, in Sudermanland; 30 miles S.W. of Stockholm.

KATNEBLOW, a town of Poland, in the palatinate of Kiev; 36 miles S. of Bialacerkiew.

KATNIA-STANITZ, a town of Ruſſia, in the government of Irkutſk; 64 miles N.E. of Vitimſkoi.

KATOENE, a town of the iſland of Ceylon; 64 miles S. of Candy.

KATOU-CARVA, in *Botany*, the name by which ſome authors have called the tree, whoſe leaves are the tamalapatra, or Indian leaf of the ſhops. See MALABATHRUM.

KATOVINDEL, the name given by the authors of the Hortus Malabaricus, to a genus of plants, called by ſome *elate*, and by Linnæus *phœnix*.

KATOUN-SERAI, in *Geography*, a town of Aſiatic Turkey, in Caramania; 12 miles S. of Cogni.

KATSCHER, a town of Moravia, in the circle of Prerau, with a lordſhip in Sileſia, to which it once belonged; 12 miles W. of Ratibor. N. lat. 49° 59′. E. long. 17° 52′.

KATTA, a town of Bootan; 15 miles S. of Biſnee.—Alſo, a town of Perſia, in Farſiſtan; 30 miles W.S.W. of Yezd.

KATTAH, a town of Arabia, in the province of Hedſjas; 160 miles E.S.E. of Madian.

KATTAYANI, in *Hindoo Mythology*, a name of Parvati, conſort of Siva.

KATTRON, in *Geography*. See GATRON.

KATUADI, a town of the Arabian Irak; 12 miles S. of Bagdad.

KATUNSKAIA, a town of Ruſſia, in the government of Koliyan; 12 miles S. of Büſk.

KATZA, a town of Germany, in the county of Henneberg; ſeven miles W.N.W. of Meinungen.

KATZEMAUGE, in *Mineralogy*. See CAT's *Eye*.

KAU, in *Geography*, a town of Africa, in the kingdom of Loango.

KAUADI, an iſland of Egypt, in lake Berelos; 13 miles N. of Faoue.

KAVARNA, a town of European Turkey, in Bulgaria, in the gulf of Varna; 22 miles N.E. of Varna. N. lat. 43° 21′. E. long. 28° 17′.

KAUBUL, a town of European Turkey, in Beſſarabia; 34 miles W. of Akerman.

KAUDER, a town of Hindooſtan, in Lahore; 40 miles S.S.W. of Lahore.

Kauder, a town of Arabia, in the province of Hedſjas; 60 miles N.W. of Mecca.

KAVERZINA, a town of Ruſſia, in the government of Tobolſk, on the Tchiuna; 20 miles E.S.E. of Eniſeiſk.

KAUFFHEUREN, a town of Germany, ſituated on the Wuttach, and till the year 1802, when it was given to the elector of Bavaria, imperial. The burghers are partly Lutherans, and partly Roman Catholics; but its magiſtracy conſiſts of eight Lutherans and four Roman Catholics. In the town-court and great council are alſo two Roman Catholic members, but the reſt are all Lutherans; 62 miles E.N.E. of Conſtance. N. lat. 47° 42′. E. long. 10° 35′.

KAUFFMAN, Mary Angelica, in *Biography*, a lady who poſſeſſed the talents and taſte of a painter in a degree very unuſual among her ſex. She was a native of Coire, the capital of the Griſons, and born in 1740. Her father was an artiſt, who, perceiving the extraordinary capacity of his daughter, and how worthy it was of the beſt cultivation, conducted her, at the age of fourteen, to Milan, and afterwards to Rome; where her talents and accompliſhments ſoon acquired her the moſt diſtinguiſhed attention. It was the happy lot of lady Wentworth, the wife of the Britiſh reſident at Venice, to be the inſtrument of conveying Angelica to England in the year 1764. Here ſhe was received in a very flattering manner; her works eagerly ſought for; and her company ſolicited by the learned, the great, and the polite. She was honoured with royal attentions, and was eſteemed and courted by artiſts. She was very induſtrious, and painted the lighter ſcenes of poetry with a grace and taſte entirely her own; and happily formed to meet that of an engraver whoſe labours highly contributed to the growth and perpetuity of her fame. Bartolozzi was the man, who, enjoying at the ſame time youth, health, and ingenuity, almoſt entirely devoted his talents between Angelica and Cipriani. The three were endowed with congenial feelings in arts; which, if not of the higheſt claſs, were certainly entitled to rank among the moſt agreeable.

After ſome years reſidence here, ſhe was unhappily deceived by a footman of a German count, who, coming to England, perſonated his maſter, contrived to be preſented at court, and perſuaded Angelica to marry him. The cheat was ſoon diſcovered, and the raſcal had not the humanity to endeavour to ſooth her diſappointment by kindneſs, but treated her very ill. At laſt, however, by a payment made to him of 300*l*., he was induced to return to Germany, and promiſed never to moleſt her any more. He kept his engagement; and the lady not hearing of him for ſeven years, and concluding him dead, then married an Italian painter of the name of Zucchi, and having ſpent ſeventeen years in England, returned with him to her native country, and thence to Rome; where her houſe became the reſort of genius and taſte; all artiſts and cognoſcenti taking pleaſure in being admitted to her converſazioni; while amateurs endowed with rank and wealth were happy in finding employment for her agreeable talents, and in the poſſeſſion of her works. She lived to the age of 67, and then fell by a gradual decay, under that power which pays regard alike to the great, the learned, the virtuous, and the profligate. She died in 1807, univerſally regretted, and was honoured by ſplendid public obſequies.

The talents of Angelica were of a pleaſing rather than of a ſplendid kind. She excelled moſt, as was moſt juſtly to be expected, in the repreſentation of female characters. Her figures of men want form and energy, and their faces and characters are all of the ſame mould. Grace, eaſe, and ſuavity of expreſſion, generally mark her women; and to ſingle figures, ſuch as "Calypſo watching the Departure of Ulyſſes," or "Penelope weeping over his Bow," ſhe imparted the true intereſt of the ſtory.

KAUGA, in *Geography*, a town of Africa, in a kingdom of the ſame name, S. of Bornou, traverſed by the Niger. The town is ſituated on a lake, called by Ptolemy "Nubia Palus," in which ſome have ſuppoſed that the Niger loſes itſelf; 225 miles S.S.E. of Bornou. N. lat. 16° 10′. E. long. 24° 40′.

KAUGASNIEMI, a town of Sweden, in the province of Savolax; 35 miles N. of Chriſtina.

KAUHAJOKI, a town of Sweden, in the government of Waſa; 24 miles E.N.E. of Chriſtineſtadt.

KAUHAVA, a town of Sweden, in the government of Waſa; 37 miles E. of Waſa.

KAUHAUT, in *Biography*, an excellent performer on the lute, and perhaps the laſt eminent muſician who highly cultivated that inſtrument. Signor Colini was the laſt good performer on the lute in England. We believe that Kauhaut was a German; but he is enumerated by M. Laborde among French compoſers; he was in the ſervice of the prince of Conti, and compoſed between 1760 and 1764 ſeveral comic operas for the Theatre Italien at Paris. But in 1772 we found him at Vienna, in high reputation as a luteniſt.

KAUI, in *Geography*, a town of Perſia, in the province of Adirbeitzan; 48 miles N.W. of Tabris.

KAUKEBAN, a ſmall unfortified town of Arabia, in Yemen, but ſituated on the ſummit of an almoſt inacceſſible mountain. A cauſeway has been formed, by which loaded camels can now advance up to the city; 18 miles W. of Sana. The country bearing this name is ſurrounded almoſt on all ſides by the dominion of the Imam of Sana; only, on one ſide, it meets the territory of the confederated Scheichs of Haſchid-u-bekil. The reigning family are deſcendants from Mahomet, by Hadi, Imam of Saade. Although they have loſt the title of Imam, they ſtill retain ſovereign authority over a conſiderable territory.

KAUKENEN, a town of Pruſſian Lithuania, on the Kauke, which runs into the Curiſch Haff; 12 miles W.N.W. of Tilſit.

KAUMARI, in *Hindoo Mythology*, is the ſakti or conſort of Kumara, or Kartikya, and is repreſented riding on a peacock, with a lance in her hand. See Kartikya and Sakti.

KAUMBOLI, in *Geography*, a town of Hindooſtan, in the circar of Ellore; 12 miles S.S.W. of Ellore.

KAUNITZ, Wenzel Antony, in *Biography*, prince of the holy Roman empire, count of Rietberg, knight of the golden fleece, &c. was born at Vienna in 1711. Being a younger child of a large family he was brought up to the church; but on the death of his elder brothers he quitted the eccleſiaſtical profeſſion to enter into the ſervice of the ſtate, in which his anceſtors had made a conſiderable figure. He laid the foundation of his ſtudies at Vienna, and in 1737, was made a counſellor of ſtate, and, two years after, imperial commiſſioner at the diet of Ratiſbon. In the year 1742, he was appointed miniſter plenipotentiary to the court of Sardinia, which had entered into a new alliance with Auſtria. A treaty was brought to a concluſion by Kaunitz, which induced the court to confer on him offices of more importance. In 1744, he went to Bruſſels, to undertake the chief management of public affairs, which, at that time, required a man of talents, as the king of France had already declared war, and the Netherlands were the firſt part of the emperor's dominions expoſed to the attack of the French army. In February 1745, he was appointed miniſter plenipotentiary, and in 1748, he took a part in the ſigning of the preliminaries of peace at Aix-la-Chapelle. On this occaſion he acquired, by his great talents for negociation, and the noble conduct which he diſplayed, the reſpect of all the miniſters then preſent. When peace was concluded, the empreſs Mary Thereſa conferred upon him the order of the Golden Fleece, and appointed him envoy to Paris. During his reſidence in that city, he laid the foundation of an alliance between France and Auſtria, which took place ſome time after. On the reſignation of count Uhlfeld, as chancellor of ſtate, Kaunitz was appointed his ſucceſſor, and recalled from Paris about the end of the year 1752, but at the ſame time was ordered to return to Bruſſels, to bring to an end the negociations in regard to the barriers, which had been carried on a whole year without ſucceſs. When he had completed this object he returned to Vienna in 1753, and entered upon the official duties of the chancellorſhip of the ſtate, in addition to thoſe belonging to the ſupreme dictatorſhip of the affairs of the Netherlands and of Lombardy, with the rank of miniſter of ſtate, which he retained till his death. In 1764, he was raiſed to the dignity of prince of the empire, with deſcent to his heirs male. He concluded the treaty of alliance between France and Auſtria in 1766, which put an end to that hoſtility which had prevailed for ſeveral centuries between the two countries. After this he had the ſole management of all foreign affairs, and enjoyed the unlimited confidence of the empreſs Mary Thereſa, and afterwards of Joſeph II., Leopold II., and Francis II. He died in June 1794, in the 84th year of his age, leaving behind him a very high reputation. Gen. Biog.

KAUNITZ, in *Geography*, a town of Moravia, in the circle of Brunn; eight miles S.W. of Brunn.—Alſo, a town of Moravia, in the circle of Znaym; 11 miles N.N.W. of Znaym.

KAUNPOUR, a town of Hindooſtan, in Moultan; 15 miles N.E. of Moultan.

KAUNUDON, a town of Hindooſtan, in Lahore; 20 miles E.N.E. of Callanore.

KAVO, one of the ſmaller Molucca iſlands, five miles S. of Machian. N. lat. 0° 5′. E. long. 127° 24′.

KAUOS, a town of Grand Bucharia; 65 miles N. of Samarcand.

KAUR, a town of Perſia, in the province of Irak; ſix miles E. of Natens.

KAURABANG, a town of Candahar; 80 miles S.W. of Cabul.

KAURESTAN, a town of Perſia, in Lariſtan; 65 miles E.S.E. of Lar.

KAURYSAOUL, a body of ſoldiers who form the laſt of the five corps of the king of Perſia's guards.

They are in number two thouſand, and are all horſe, commanded by the conſtable, and in his abſence by the captain of the watch. They keep watch in the night around the palace, ſerve to keep off the crowd when the ſophi goes on horſeback, keep ſilence at the audience of ambaſſadors, ſeize the khans and other officers when diſgraced, and cut off their heads when the ſophi commands it.

KAURZIM, in *Geography*, a town of Bohemia, and capital of a circle of the ſame name, on a river which runs into the Elbe; the circle ſupplies Prague and other places with timber; 24 miles E.S.E. of Prague. N. lat. 49° 56′. E. long. 15° 5′.

KAUSZAN, a town of Beſſarabia, inhabited by Budziack Tartars; 12 miles S.S.E. of Bender.

KAUTEE, a town of Bengal; 14 miles E. of Toree.

KAUVERI, or KAVERI, in *Hindoo Mythology*, the ſakti or conſort of Kuvera, the deformed god of riches. The river in Myſore, in which is the iſland of Sri-rangapatan, or Seringapatam, uſually written Caveri, is named after this goddeſs. See KUVERA, and CAVERY.

KAWAH, in *Geography*, a town of Hindooſtan; in the circar of Ellichpour; 20 miles E. of Omrautty.

KAWAR, or KUAR, a country of Africa, lying to the northward of Kuku and Bornou, and extending eaſtward to Al W'ehat. It is bounded on the N. by that extenſive deſert which ſeparates Egypt from Fezzan, and which is the proper deſert of Libya; on the E. by Egypt, and on the W. by the deſert of Bilmah.

KAWOMURAH, a town of Japan, in the iſland of Niphon; 100 miles N.W. of Meaco.

KAWTAH, a town of Hindooſtan, in the circar of Singboom; 45 miles E. of Doeſa.

KAWUCK, or KHAWICK, the furtheſt, or moſt eaſtern, of the paſſes leading through Hindoo-Kho into the province of Cabul.

KAWUTZA, a town of Sweden, in the government of Abo; 25 miles S.E. of Biorneborg.

KAXHERTA, a town of Sweden, in the government of Abo, on an iſland in the gulf of Finland; five miles S. of Abo.

KAY, KEY, or *Quay*, a wharf or place by the waterſide, in a ſea-port, for the loading and unloading of merchandize.

The verb *cajore*, in old writers, according to Scaliger, ſignifies *to keep in* or *reſtrain;* and hence came our term *kay;* the ground where keys are made being bound in with planks and poſts.

The lawful keys and wharfs for the lading or landing of goods, belonging to the port of London are the following: *viz.* Cheſter's Key, Brewer's Key, Galley Key, Wool Dock, Cuſtom-houſe Key, Bear Key, Porter's Key, Sab's Key, Wiggan's Key, Young's Key, Ralph's Key, Dice Key, Smart's Key, Somer's Key, Hammond's Key, Lyon's Key, Botolph Wharf, Graunt's Key, Cock's Key, and Freſh Wharf; beſides Billingſgate, for landing fiſh and fruit; and Bridgehouſe in Southwark, for corn and other proviſions; but for no other goods or merchandize. Deal-boards, maſts, and timber, may be landed at any place between Limehouſe and Weſtminſter; the owner firſt paying or compounding for the cuſtoms, and declaring at what place he will land them.

KAYA, in *Geography*, a town of Cacongo. S. lat. 5° 20′. E. long. 12° 10′.

KAYADERE, a town of Aſiatic Turkey, near the W. coaſt of Natolia; five miles E.N.E. of Vourla.

KAYAGE, the money, or toll, paid for loading or unloading wares at kays.

KAYANG, in *Geography*, a river of the iſland of Celebes, which runs into Boni bay. S. lat. 4° 59′. E. long. 120° 40′.

KAYCOON Point, a cape on the W. coaſt of the iſland of Celebes. S. lat. 3° 22′. E. long. 129° 50′.

KAYDANOW, a town of Lithuania, in the palatinate of Minſk; 16 miles S.S.W. of Minſk.

KAYE, a town of Africa, in the kingdom of Loango; 10 miles N.W. of Loango.

Kaye's *Iſland*, an iſland in the N. Pacific ocean, near the W. coaſt of North America, diſcovered by Capt. Cook in his third voyage, May 1778, and thus named in honour of Dr. Kaye, late dean of Lincoln. It is 11 or 12 leagues in length, in the direction of N.E. and S.W.; but its breadth is not above a league, or a league and a half, in any part of it. The S.W. point, which lies in lat. 59° 49′, and long. 216° 58′, is a naked rock, conſiderably elevated above the land within it. Towards the ſea, the iſland terminates in bare ſloping cliffs, with a beach, a few paces wide, of large pebble ſtones, intermixed here and there with a browniſh clayey ſand. Parts of the ſhore are interrupted by ſmall vallies and gullies; in each of which a torrent ruſhes down with violence, which is furniſhed by the melted ſnow. Theſe vallies are filled with pine-trees, extending from the entrance to about the middle part of the iſland. This iſland is covered with a broad girdle of wood, ſpread upon its ſide, included between the top of the cliffy ſhore, and the higher parts in the centre. The trees are of diminutive ſize. About the wood were obſerved a crow, and white headed and white breaſted eagles; and fowls of various kinds were ſeen upon the water and near the ſhore. No animals were ſeen except a fox; nor were perceived any ſigns of inhabitants ever having been upon the iſland. Cooke's Third Voyage, vol. ii.

KAYEE, a town of Africa, in Kajaaga, on the Senegal. N. lat. 14° 30′. W. long. 9° 35′.

KAYKIYA, in *Hindoo Mythological Hiſtory*, is one of the three wives of Daſarat'ha, the father of Rama-chandra. About the period of the birth of the latter hero, Kaykiya, or Kahikeya, produced Lucins, his half brother, to aſſiſt him in the wars of Lanka or Ceylon, as detailed at great length in *Ramayana*, which ſee.

KAYMEN, in *Geography*, a town of Pruſſia, in the province of Samland; 12 miles E.N.E. of Konigſberg.

KAYMOURA, a town of Africa, in Bondou; 15 miles S.S.W. of Fatteconda.

KAYNS, a race of mountaineers in the Birman empire, perfectly diſtinct from the Carianers, and ſpeaking a language differing radically both from theirs and that of the Birmans. They were originally inhabitants of the Arracan mountains, whom the Birmans, ſince their conqueſt of that kingdom, have prevailed on, partly by force, and partly by mild treatment, to abandon their native hills, and ſettle on the plain. There are ſeveral ſmall ſocieties of theſe people eſtabliſhed near the foot of the mountains further north. The Carianers are not to be found higher up than the city of Prune.

KAYOO, a town of Africa, in Bambarra, on the Niger. N. lat. 13°. W. long. 4° 59′.

KAYOR, or Cayor, a kingdom of Africa, near the ſea-coaſt, between the rivers Gambia and Senegal.

KAYSERSWERT, a town of Germany, on the E. ſide of the Rhine, once fortified, but now without walls; for a long time annexed to the biſhopric of Cologne, but in the year 1762, reſtored to the elector palatine; 24 miles N. of Juliers. N. lat. 51° 16′. E. long. 6° 37′.

KAYUWAH, a town of Pegu, on the left bank of the Ava; 15 miles S. of Prome.

KAYZEVAN, a town of Turkiſh Armenia; 69 miles S.W. of Erivan.

KAZAKOVA, a town of Ruſſia, in the government of Irkutſk; 12 miles W. of Nertchinſk.

KAZAN, a city of Ruſſia, and capital of a government of the ſame name, ſituated on the Volga. In the Turkiſh and Tartarian languages, kazan ſignified a cauldron large enough to contain victuals for many perſons; and hence the name has been given by the Crim and Budziak Murſes to the families of their ſubjects or vaſſals, reckoning about 10 men to a kazan. This city conſiſts of a ſtrong fort, built with ſtone; the wooden town, as it is called; and ſeveral adjoining ſlobodes, or ſuburbs; and among them is one inhabited by Tartars, in which are four metſheds. Here are alſo ſeveral churches built with ſtone, and 11 convents in and near the town. The governor of the fort has the command of the garriſons and regiments; the garriſon of the city conſiſts of three regiments, for which a good hoſpital is provided. Kazan is alſo an archbiſhop's ſee. Here are alſo a manufacture of cloth, and a ſchool, in which are taught the Ruſſian and Latin languages, the principles of the Chriſtian religion, and the elements of philoſophy, in order to qualify preachers for the converſion of the nations to which they belong. This city was totally deſtroyed by fire in the years 1749 and 1752. Kazan was once the capital of a principal part of Tartary, and the ſeat of government, where the royal family reſided. The Ruſſians firſt made themſelves maſters of this important place on the 3d of October 1552; 400 miles E. of Moſcow. N. lat. 55° 45′. E. long. 49° 3′.

This khanate (ſee Kaptschak) ſubſiſted as a peculiar ſtate till the year above-mentioned, 1552, when it was conquered by czar Ivan II., and incorporated for ever with the Ruſſian empire. The city of Kazan had been built in the year 1257 by a ſon of Banty, nephew of Tſchingis-khan; and this khanate aſſerted its independency about the ſame time (1441) when the Krim disjoined itſelf from Kaptſchak. The preſent Kazan Tartars are but a feeble remnant of what they were, partly conſiſting of thoſe who remained in their old ſeats, and partly ſuch as ſettled as fugitives, in other diſtricts of Ruſſia. They principally dwell at preſent in the governments of Kazan, Simbirſk, Rieſan, Viatka, Perme and Ufa (particularly in the Orenburg diſtrict of that government); their number is upon the whole conſiderable, but in no degree proportionate to the idea we form of their ancient population, from hiſtorical accounts; for, as far as we are able to conclude from particular ſtatements, they cannot amount to much above 100,000. Theſe Tartars form the root of the native of Ruſſia; being not only unmingled, but alſo of a ſuperior civilization to moſt of the remaining branches of their brethren. Tooke.

KAZANOW, a town of Poland, in the palatinate of Sandomirz; 40 miles N.N.W. of Sandomirz.

KAZANSKAIA, a town of Ruſſia, in the country of the Coſſacks, on the Don; 100 miles S.S.E. of Veronetz.

KAZANSKOE, or *Government of* Kazan, a government of Ruſſia, bounded on the N. and N.E. by Viatſkoe, on the E. by Uphimſkoe, on the S. by Simbirſkoe, and on the W. by Niznei-Gorodſkoe; about 100 miles in length, and from 100 to 110 broad; the capital is Kazan.

KAZARON, a town of Perſia, in the province of Farſiſtan; 55 miles W.S.W. of Schiras. N. lat. 29° 44′. E. long. 51° 28′.

KAZIKIRAN, a town of Perſia, in the province of Adirbeitzan; 45 miles S.E. of Urmia.

KAZIMIERS. See Casimir.

KEA, a town of Africa, in the kingdom of Bambarra; 65 miles N.E. of Sego.

KEADUE, a poſt-town of the county of Roſcommon, province of Connaught, Ireland; 85 miles from Dublin.

KEADY, a market and poſt-town of the county of Armagh, province of Ulſter, Ireland, ſituated on the river Callan, along the banks of which, from Armagh to this place, are many conſiderable bleach greens, the linen manufacture being carried on here very extenſively. Keady is 50 miles N. from Dublin; and ſix S. from Armagh.

KEAJA, or Kiahia, is the name of the lieutenant of the chief officers of the Porte, or the ſuperintendant of their particular court.

KEALE, ſmall fragments reſembling chips or broken pieces of ſtone of various kinds; ſome of lime-ſtone, others of free-ſtone, and others of rag-ſtone, found mixed among the earth, of the upper ſtratum in many parts of this kingdom, and giving that ſoil the name of kealy; hence, ſome of theſe pieces of keale are thin and flat like bits of ſlate.

KEALY Soil, in *Agriculture*, is uſed by the huſbandmen for a ſort of land, plentifully ſtrewed with keale or kale.

KEANPAN Head, in *Geography*, a cape on the E. coaſt of the iſland of Lewis, forming the N.E. point of the peninſula of Aird. N. lat. 58° 15′. W. long. 6° 5′.

KEANGON, a town of Grand Bucharia; 75 miles N.W. of Anderab.

KEARAH, a town of Hindooſtan, in Bahar; 30 miles S.S.W. of Patna.

KEATE, George, in *Biography*, an entertaining and miſcellaneous writer, was born at Trowbridge, in Wiltſhire, in the year 1729. Having been educated at Kingſton, he repaired to Geneva, where he reſided ſome years, and contracted an intimacy with Voltaire. He made the tour of Europe, and returning to his native country, entered himſelf as ſtudent in the Inner Temple, and was in due time called to the bar, and ſometimes attended the courts in Weſtminſter Hall, though he did not practiſe, either on account of his want of encouragement, or for want of a degree of application ſufficient to make himſelf maſter of his profeſſion. His firſt literary performance was entitled, "Ancient and Modern Rome," a poem written at Rome in the year 1755. It was publiſhed in 1760, and was very well received by the public: he next produced "A ſhort Account of the Ancient Hiſtory, preſent Government, and Laws of the Republic of Geneva." In 1768 or 69, he publiſhed "Ferney," an epiſtle to Voltaire, in which he introduced a fine eulogium on Shakſpeare, which procured for him the compliment, from the mayor and burgeſſes of Stratford, of a ſtandiſh mounted with ſilver, made out of the mulberry-tree planted by that illuſtrious bard. In 1779, he publiſhed "Sketches from Nature, taken and coloured in a Journey to Margate," in two vols. 12mo. This, though an avowed imitation of Sterne's "Sentimental Journey," contains ſo many juſt ſtrictures on life and manners, enlivened by ſtrokes of genuine humour and delicacy of ſentiment, as to have been extremely popular, and it was thought that Sterne never had ſo happy an imitator as Keate. In 1781, he collected his poetical works, and publiſhed them in two volumes, which he dedicated to Dr. Heberden. The laſt, and his beſt production, and that which did moſt credit to his genius and liberality, was the "Account of the Pelew Iſlands," which he drew up and publiſhed in 1788. This work is written with great elegance, and compiled with much care: it had a conſiderable ſale, but the author drew it up from the moſt diſintereſted motives, and received no advantage from it whatever. He died in the year 1797, leaving behind him ſeveral other publications beſides thoſe already noticed. Gentleman's and Monthly Magazines.

KEATING, Geoffrey, an Iriſh hiſtorian, was a native of Tipperary, and flouriſhed in the earlier part of the ſeventeenth century. He was educated with a view to the duties of the Roman Catholic church, and having received at a foreign univerſity the degree of doctor of divinity, he returned to his native country, and became a celebrated preacher. Being well verſed in the ancient Iriſh language, he collected the remains of the early hiſtory and antiquities of the iſland, and formed them into a regular narrative. This work he finiſhed about the time of the acceſſion of Charles I. to the throne: it commences from the firſt planting of Ireland, after the deluge, and goes on to the 17th year of king Henry II., giving an account of the lives and reigns of one hundred and ſeventy-four kings of the Mileſian race. From the above circumſtances, our readers will readily ſuppoſe that this work is little better than fiction. Indeed the advocates of the author allege in his defence, that he has given his extraordinary relations merely as fables, and not as true hiſtory. It remained in MS. in the original language, till it was tranſlated into Engliſh by Dermot O'Connor, and publiſhed in London in 1723. A new edition was publiſhed in 1738, with plates of the arms of the principal Iriſh families. Keating died about the middle of the ſeventeenth century.

KEBAN, in *Geography*, a town of Aſiatic Turkey, in the province of Diarbekir; 70 miles N. of Diarbekir.

KEBER, the name of a ſect among the Perſians, who, in general, are rich merchants. See Gabres.

KEBET, in *Geography*, a ſmall iſland in the Eaſt Indian ſea. S. lat. 7° 10′. E. long. 130° 40′.

KEBLA, or Keblah, called alſo *Kebleh*, *Kiblah*, and *Alkebla*, among the Muſſulmen, denotes that point, or quarter, to which they turn themſelves when they ſay their prayers.

Mahomet, at firſt, durſt not propoſe any other kebla to his followers but the temple of Jeruſalem, which was the kebla of the Jews and Chriſtians. In the courſe of time, however, being willing to bring them off from any communication in matters of religion, with the Jews and Chriſtians, he appointed them, in the Koran, to turn themſelves, at prayer, towards the temple of Mecca: from which time they called thoſe two temples the *keblatan*, or two keblas.

Ricaut adds, that it is not the temple of Mecca, properly ſpeaking, that the Turks call kebla, but rather the large ſquare tower in the middle of the amphitheatre of that temple.

The kebla of the Jews was the temple at Jeruſalem; that of the Sabians, the meridian; and that of the Magians, the riſing ſun. To this the prophet Ezekiel refers chap. viii. 16.

Kebla is alſo uſed for an altar; or rather a *niche*, as Ricaut calls it, which the Mahometans have in all their moſques, and which is placed very exactly on that ſide towards the temple of Mecca.

Hence alſo kebla comes to be uſed, metaphorically, for the object, or end propoſed, in doing any thing.

Thus, the kebla of kings, is their crown and authority; that of men of buſineſs, is money; that of gluttons, good cheer, &c.

KEBLA-NOMA, or Kebleh-noma, a name which the Turks and Perſians give to a little pocket-compaſs, which they always carry with them, in order to place themſelves the more exactly when they go to prayers.

KEBLE, Joseph, in *Biography*, ſon of Richard Keble, eſq. a lawyer of reputation at Ipſwich, was born in London in 1632, and ſtudied at Jeſus and All-Souls colleges in Oxford. He was admitted a barriſter at Gray's Inn, and attended with the utmoſt aſſiduity at the king's bench for fifty years, though it is believed he never had a cauſe put into his hands, or was called to make a motion. He died ſuddenly in 1710, as he was ſtepping into a coach at Holborn-gate, being in his 78th year. His publications were numerous, and chiefly on legal ſubjects. He publiſhed, however, an eſſay on "Human Nature;" and another on "Human Actions." At his death, it is ſaid, his manuſcripts amounted to one hundred folios, and more than fifty quartos, all in his own hand-writing. Biog. Brit.

Keble's *Iſland*, in *Geography*, an iſland in the Mergui Archipelago, about five miles long, and 1½ broad. N. lat. 8° 59'.

KEBUCK Head, a cape on the E. coaſt of the iſland of Lewis. N. lat. 58° 2'. W. long. 6° 19'.

KECKERMAN, Bartholomew, in *Biography*, a Pruſſian divine, was born at Dantzic in the year 1571: here he received the elements of a learned education, and at the age of eighteen he was ſent to the univerſity of Wittemberg, and ſtudied philoſophy and divinity two years. From this ſeminary he went to the univerſity of Leipſic, where he ſpent ſome time, and then removed to Heidelberg. At this place he took his degrees, and at length became a tutor in ſeveral branches of knowledge. The fame which he acquired, as profeſſor of Hebrew, induced the ſenate of Dantzic, in the year 1597, to invite him to become co-rector of the celebrated academical inſtitution in that city, an office which he thought proper to decline. Four years afterwards the invitation was renewed, and he accepted it. The profeſſorſhip to which he devoted his talents was that of philoſophy, and he propoſed to lead ſtudents to its inmoſt receſſes by a more compendious method than had been before adopted. According to his plan, they were to complete their courſe of ſtudies in three years. In the execution of his method he drew up a great number of treatiſes on almoſt all ſubjects that could claim the attention of the young; but by ſtudying, writing, and teaching, he ruined his health, and fell a ſacrifice to his induſtry in the thirty-eighth year of his age. His works have been publiſhed in two volumes, folio.

KECKLE, on *Board a Ship*. When the cables gall in the hawſe, or the bolt-ropes do ſo againſt the ſhip's quarter, the ſeamen wind ſome ſmall ropes about them; and this is called *keckling*.

KEDAS, in *Geography*, a town of Bengal; 15 miles S.E. of Midnapour.—Alſo, a town of Syria, on the river Jermuk, anciently called *Gadara*; 56 miles N. of Jeruſalem.

KEDE', or Quade, a town of Africa, in the country of the Foulahs; 40 miles W. of Kayor.

KEDE-FARAH, a town of Aſiatic Turkey, in the government of Sivas, on the Kizilermack; 30 miles W. of Samſoun.

KEDGE, or Kidge. See Gedrosia and Macran.

KEDGER, or Kedge-*anchor*, in a *Ship*. See Anchor.

KEDGING, a ſea-term uſed when a veſſel is brought up or down a narrow river by the wind, though the tide be contrary to it.

To do this, the ſeamen ſet their fore-ſail, foretop-ſail, and mizen-ſail, and let her drive with the tide, that they may flat her about. If ſhe come too near the ſhore, they have a little anchor ready, called the *kedger*, or *kedge-anchor*, with a hawſer faſtened to it from the ſhip; and this they drop in the midſt of the current, by which means they wind her head about; and this done, take up the anchor again.

KEDGOORA, in *Geography*, a town of Hindooſtan, in Bundelcund; 30 miles N.N.E. of Callingar.

KEDGREE, a town of Hindooſtan; 34 miles N.E. of Benares.

KEDHAM, a town of Upper Guinea, ſituated on the river Scherbro; 200 miles from its mouth.

KEDOUS, a town of Aſiatic Turkey, in Natolia; 32 miles W. of Kintaja.

KEDRELÆON, Cedrelaion, in the *Materia Medica of the Ancients*, an oil taken from the *pix cedri*, or pitch of the cedar-tree.

KEDRON, in *Geography*. See Cedron.

KEEBLE, John, in *Biography*, an eminent organiſt and harpſichord-maſter, who, in 1737, on Roſeingrave being ſuperſeded at St. George's, Hanover-ſquare, on account of the derangement of his intellects, was appointed officiating organiſt of that church, upon half the ſalary, during the life of his predeceſſor. See Roseingrave.

Mr. Keeble was the firſt performer on the organ at the opening of Ranelagh, and at the ſubſcription concert eſtabliſhed by Hickford at his room in Brewer's-ſtreet. (See Hickford.) He had likewiſe, to the end of his life, the beſt range of teaching of any maſter in London; and was ſo ſure of pupils of rank and faſhion, in the immediate vicinity of his own reſidence, in Prince's-ſtreet, Hanover-ſquare, that he declined the attendance of any others.

This able and experienced maſter, beſides his practical abilities, had a paſſion for theoretical ſtudies, and ſpent his leiſure hours, during many years, in the inveſtigation of the muſic of the ancients, and the *Harmonica*, which ſee. He was ſuppoſed to die worth 30,000*l.* in 1786.

KEEFA, in *Geography*, a town of Africa, in Algiers; ſix miles N.E. of Tipſa.

KEEL, in *Botany*. See Carina.

Keel, the loweſt piece of timber in a ſhip, placed in the bottom of her hull; one end thereof being let into the ſtern-poſt, and the other into the ſtem.

If we compare the carcaſe of a ſhip to the ſkeleton of the human body, the keel may be conſidered as the back-bone, and the timbers as the ribs. It, therefore, ſupports and unites the whole fabric, ſince the ſtem and ſternpoſt, which are elevated on its ends, are, in ſome meaſure, a continuation of the keel, and ſerve to connect and incloſe the extremities of the ſides by tranſoms; as the keel forms and unites the bottom by timbers. The keel is generally compoſed of ſeveral thick pieces, placed lengthways, which, after being ſcarſed together, are bolted and clinched upon the upper ſide. When theſe pieces cannot be procured long enough to afford a ſufficient depth to the keel, there is a ſtrong thick piece of timber bolted to the bottom thereof, called the *falſe* keel.

When a ſhip has a deep keel, ſhe is ſaid to have a *rank* keel; and this ſerves to keep her from rolling.

Keel is alſo a name given to a low flat-bottomed veſſel, uſed in the river Tyne, to bring the coals down from Newcaſtle, and the adjacent parts, in order to load the colliers for tranſportation.

Keel, *upon an even*, in *Sea Language*, denotes the poſition of a ſhip when her keel is parallel to the plane of the horizon, ſo that ſhe is generally deep in the water at both ends.

Keel-*haling*, or *Keel-raking*, is a puniſhment inflicted at ſea, in the Dutch navy, on very great offenders, who are drawn underneath the very keel of the ſhip. See Ducking.

Keel-*rope*, a hair rope running between the keelſon and the keel of a ſhip, to clear the limber-holes when they are choaked up with ballaſt, &c.

KEELAGE, Killagium, a privilege to demand money for the bottoms of ſhips reſting in a port or harbour.

KEELERS, in the *Sea Language*, ſmall tubs to hold ſtuff to grave a ſhip's bottom.

KEELING, a name uſed in ſome Engliſh writers for the common cod-fiſh. See ASELLUS.

KEELSON is a keel withinſide ſimilar to that without, upon the floor timbers exactly over the keel of the ſame dimenſions, but always oak, keeping their butts or ſcarfs clear of each other: thus the bottom of the ſhip becomes firmly united by bolts driven through every floor timber, from the upper ſide of the keelſon to the under ſide of the keel.

KEEMA-KEDAN, in *Geography*, a cluſter of ſmall iſlands in the Eaſt Indian ſea, near the W. coaſt of the iſland of Leyta. N. lat. 10° 30′. E. long. 124° 36′.

KEEMO, in *Natural Hiſtory*, a large ſhell of the cockle-kind; probably, ſays Marſden (Hiſt. of Sumatra, p. 9.) the largeſt in the world. It is found in the bay of Tappanooly, in Sumatra, chiefly, and likewiſe in other parts of the Eaſt. Theſe ſhells are taken in deep water, by thruſting a long bamboo between the valves as they lie open, and by the immediate cloſure which follows they are made faſt. The largeſt, ſays Mr. Marſden, which I have ſeen, was about three to four feet over. The ſhell is perfectly white, and is worked up like ivory by the natives.

KEENDUEM, in *Geography*, a river which riſes in Thibet, and runs into the Irrawaddy, 40 miles below Ava. This great river comes from the N.W. and divides the country of Caſſay from that of Ava. It is navigable, as far as the Birman territory extends, for veſſels of burthen. The entrance of the Keenduem is about a mile wide.

KEENE, EDMUND, in *Biography*, an Engliſh prelate, was born at Lynn, in Norfolk, of which place his father was alderman. He was educated at Caius college, Cambridge, and, in 1740, obtained the rectory of Stanhope, in the biſhopric of Durham. In 1750, he was choſen maſter of St. Peter's college, and in a ſhort time after he ſerved the office of vice-chancellor, in which he promoted the regulations for improving the diſcipline of the univerſity. In 1752, he was made biſhop of Cheſter, where he continued eighteen years, when he was tranſlated to Ely. He died in the year 1781. He had a brother who was ſeveral years ambaſſador at the court of Madrid. Gen. Biog. Dict.

KEENE, in *Geography*, a poſt-town of America, in New Hampſhire, and one of the moſt flouriſhing in Cheſhire county; incorporated in 1753, and containing, in 1800, 1645 inhabitants. It is 86 miles N.W. from Boſton.

KEENEEBALOV, or ST. PETER'S MOUNT, a large mountain in the N. part of the iſland of Borneo, near which are a people called Oran, Idaen, and Maroots, who offer human ſacrifices to their deity. It is ſaid that they are acquainted with a ſubtle poiſon, in which they dip their ſmall darts, and thus cauſe a wound which produces inſtant death.

KEEP, *To*, in *Sea Language*, is a term uſed on various occaſions: as

To keep the land abroad, is, to keep within ſight of land as much as poſſible. See HOLD.

To keep the luff, is to continue cloſe to the wind, or to ſail with a courſe inclined to the direction of the wind as much as poſſible, without deviating to leeward. This is alſo called *keeping the wind*. See CLOSE-*hauled* and LOOF.

To keep off, is to ſail off, or keep at a diſtance from the ſhore. See OFFING.

KEEP, or *Dungeon*, the ſtrong tower of an ancient caſtle, commonly placed on a high natural or artificial mount, into which the garriſon retired when the caſtle itſelf was taken. The lake or cellar of ſuch keep was generally uſed to confine priſoners in.

KEEPER *of the Foreſt*, otherwiſe called *chief warden of the foreſt*, is an officer who has the principal government of all things belonging to a royal foreſt, and the check of all the other officers.

The lord chief juſtice in eyre of the foreſt, when he thinks fit to hold his juſtice ſeat, ſends out his general ſummons to the keeper forty days before, to warn all under-officers to appear before him, at a day aſſigned in the ſummons. See JUSTICE *of the foreſt*.

KEEPER *of the Great-ſeal*, is a lord by his office, and is ſtyled *lord keeper of the great-ſeal*. He is one of the king's privy-council, through whoſe hands paſs all charters, commiſſions, and grants of the king under the great-ſeal; without which ſeal, all ſuch inſtruments, by law, are of no force: for the king is, in the interpretation of the law, a corporation, and paſſes nothing firmly but under the ſaid ſeal; which is, as the public faith of the kingdom, in the higheſt eſteem and reputation.

The lord keeper has the ſame place, authority, pre-eminence, juriſdiction, execution of laws, and all other cuſtoms, commodities, and advantages, as the lord chancellor of England has for the time being. Both theſe officers cannot properly ſubſiſt at the ſame time, ſince the ſtatute of 5 Eliz. The lord chancellor, or lord keeper, is ſuperior in point of precedency to every temporal lord.

KEEPER *of the Privy-ſeal*, is a lord by his office; through whoſe hands paſs all charters ſigned by the king, before they come to the great ſeal, and ſome things which do not paſs the great-ſeal at all. He is of the king's privy council, and was anciently called *clerk of the privy-ſeal*; yet reckoned in the number of the great officers of the realm. 12 Ric. II. c. 11. 27 Hen. VIII. c. 11.

KEEPER, *Boat*, in *Sea Language*, one of the rowers, who remains as a centinel in his turn, to take care of any boat and her contents, either when ſhe lies by the ſhore, or alongſide of the ſhip; or when ſhe is towed a-ſtern of her.

KEEPER, *The*, in *Geography*, a high mountain in the county of Tipperary, province of Munſter, Ireland, which forms a conſpicuous object to a great extent of country. It is ſeven miles S.S.W. from Nenegh.

KEEPING, in *Painting*, is a technical term, which ſignifies the peculiar management of thoſe parts of the art, colouring and chiaro-ſcuro, which produces the proper degree of relievo in objects admitted into a compoſition; according to their relative poſitions in the imagined ſcene, and the degree of importance the artiſt attaches to them.

When he has choſen his ſubject, and arranged his figures, forms, and colours, his next taſk will be, to give each object its local ſituation, and to bring thoſe forward in the picture which he intends ſhould be moſt impreſſive on the beholder; or at leaſt, ſo to manage the ſurrounding ones, that thoſe which are principal in the ſubject and compoſition, ſhould not fail of their effect. This may be effected either by ſhade or colour: either by throwing a ſhadow acroſs the inferior objects, or teinting them with a colour leſs bright than that given to the others; and even, in very ſkilful hands, it may be done by the very reverſe mode of practice to either of the above: but that is extremely difficult, and requires the knowledge and the hand of a great maſter in the art to execute it.

As the objects recede in the ground-plane of the picture, the hue of the atmoſphere intermixing with their proper, or local colour, as it is termed, (though improperly ſo,) will aſſiſt in their keeping; *i. e.* will cauſe them to appear at their juſt diſtance from the front figures. Therefore there is leſs art required here, than in ſeparating and rounding figures ſituated nearly in the ſame plane, and combining together in maſſes, wherein the great difficulty of keeping lies.

It will be ſeen by what has been ſaid, that keeping is but another word for *effect* in its more confined ſenſe, as it relates to the individual objects of a picture; it is, however, a component part of *effect* in its general and moſt extenſive meaning; of which it forms the baſis in conjunction with arrangement of forms and colours; which latter includes, in the painter's eye, lights and ſhades. See Effect, in *Painting*.

On keeping, relievo entirely depends; for if the lights, ſhadows, and half-teints be not kept in their exact relative proportions of depths, no rotundity can be effected; and without due oppoſition of light, ſhade and colours, no apparent ſeparation of objects can take place.

Whatever kind of effect is intended, keeping muſt be called into action; ſince each object muſt have its own apparent, proper, and local projection; and no leſs its relative ſtrength in regard to the general impreſſion which the ſubject is calculated to produce.

So much has been ſaid that applies to this article under the word Effect, that we forbear to enlarge further upon it, than juſt to ſtate, that the Flemiſh ſchool may be moſt advantageouſly ſtudied with regard to it, in what relates to hiſtory, portraiture, and ſtill life: and in landſcape, we would add to Ruyſdale and Hobbima, the more valuable name of Claude, as the painter who has produced the moſt exquiſite productions in art for the quality we are now diſcuſſing.

KEEPITHEJA, in *Botany*, the name by which ſome authors call the trees, on the branches of which the gum lacca of the ſhops is uſually found.

KEERA, in *Geography*, a town of Hindooſtan, in Boggilcund; 12 miles E. of Kewah.

KEERETPOUR, a town of Hindooſtan, in the circar of Sumbul; 10 miles S.S.W. of Nidjibabad.

KEERPOU, a town of Hindooſtan, in Bengal; 33 miles S.S.W. of Burdwan. N. lat. 22° 45'. E. long. 87° 35'.

KEERYSHUR, a town of Hindooſtan, in the Carnatic; 22 miles S.S.W. of Bomrauzepollam.

KEESERA, a town of Hindooſtan, in the circar of Condapilly; 16 miles N.W. of Condapilly.

KEEVE, in *Rural Economy*, a provincial term uſed to ſignify a vat in which beer is worked or fermented.

Keeve is alſo a veſſel uſed in dreſſing tin-ores. See Tin.

KEFF, or Kefts, in *Geography*, a town of Africa, in the kingdom of Tunis, reckoned the third for riches and ſtrength in the country: anciently called "Sicca," or "Sicca Veneria." In the 18th century the citadel was blown up, and afterwards rebuilt with additional ſtrength and beauty. In levelling an adjacent mount on this occaſion an entire ſtatue of Venus was dug up, which was inſtantly broken to pieces by the Moors. At the ſame time was dug up an equeſtrian ſtatue, dedicated to Marcus Antoninus Rafus, which ſuffered the ſame fate. Keff, as its name imports, is ſituated upon the declivity of a hill, with a plentiful ſource of water near the centre of it; 70 miles W.S.W. of Tunis. N. lat. 36° 15'. E. long. 9° 3'.

KEFFEKIL, in *Mineralogy*, a ſtone of a white or yellow colour, ſoapy feel, and moderate hardneſs, which increaſes in the fire. It is the ſubſtance of which the large Turkey pipes are made. It is found in Krim Tartary, in Canada, in Flanders, and in other places. The Tartars uſe it inſtead of ſoap, and it is ſo uſed in Auſtrian Flanders. Wiegleb found it to conſiſt of equal parts of magneſia and ſilex, whence it ſeems to operate as a fuller's earth. See Meerschaum.

KEFFING, in *Geography*, a ſmall iſland in the Eaſt Indian ſea, near the S.E. coaſt of the iſland of Ceram. S. lat. 3° 28'. E. long. 131° 11'.

KEFIL, a village of the Arabian Irak, famous for the tomb of the prophet Ezekiel, annually viſited by a multitude of Jews; 14 miles S. of Helleh.

KEFKEBEH, a town of Natolia; 20 miles N.E. of Eſkiſhehr.

KEFKEN, a ſmall iſland in the Black ſea, near the coaſt of Natolia. N lat. 41° 6'. E. long. 30° 40'.

KEFREEN, a town of Syria, on a large plain to which it gives name, diſtinguiſhed for the number of pigeons that are bred there; 15 miles from Aleppo.

KEFT, or Kepht. See Coptos.

KEHEEP, a town of Hindooſtan, in Lahore; 45 miles S. of Attock.

KEHEMEND, a town of Perſia, in the province of Farſiſtan; 35 miles N. of Eſtakar.

KEHL, a fortreſs in the duchy of Baden. At the peace of Ryſwick in 1697, this fort was ceded to the emperor and empreſs, and declared an imperial fortreſs. In the war between France and Auſtria, it was often taken and retaken; 2 miles E. of Straſburg. Kehl was united to the French empire by a decree of the Conſervatory Senate in January 1808, and made a part of the department of the Lower Rhine.

KEHOA, a town of Aſia, in Tonquin, near the coaſt. N. lat. 19° 12'. E. long. 105° 21'.

KEHRICZ, a town of Perſia, in Khoraſan; 70 miles N. of Herat.

KEIA-REGIAN, a town of Perſia, in Irak; 60 miles W.N.W. of Hamadan.

KEIFLINGE, a town of Sweden, in the province of Schonen; 6 miles N.E. of Lund.

KEI-GAM, a town of Corea; 30 miles S.E. of Coufou.

KEIGHLEY, a town of England, in the county of York, ſituated on a navigable canal, and having a market on Wedneſday. In 1801, the population conſiſted of 5745 perſons, of whom 5456 were employed in trade and manufacture; 12 miles N. of Halifax, and 209 N.N.W. of London.

KEIKEM, in the *Materia Medica*, a name given by the Arabian writers to a gum uſed in their time for making of varniſh.

Gum lacca is generally ſaid to be the ſubſtance meant by it, but Avicenna ſeems to expreſs by it every thing that was uſed as varniſh. Thus he ſometimes means by it the gum ſandarach, and ſometimes amber. The gum cancamum of the Greeks is alſo certainly often meant by it; but this is ſcarce to be mentioned as an application of the word, it being almoſt as general a term as itſelf, and ſtanding with many of the old authors for ſandarach, gum lac, and amber, as well as for the gum properly expreſſed by it. In ſhort, all the gums uſed in making varniſh, are in general called by the names of any one of them, and thus vernix, ſandarach, cancamum, and lacca, are made ſynonymous words, and either ſtands for each of the things ſignified by all the words.

KEIKIS, in *Geography*, a town of Sweden, in the government of Abo; 48 miles N. of Biorneborg.

KEILAH. See Cila.

KEILL, John, in *Biography*, a celebrated mathematician and philoſopher, was born at Edinburgh in the year 1671; here alſo he received his early education, and at the univerſity purſued his maturer ſtudies, and took his degree of M.A. He was particularly attached to Dr. Gregory, who taught the mathematics, and read a courſe of lectures on the Newtonian philoſophy. Under him and by his aid he was enabled to make himſelf maſter of the "Principia," which he regarded as the ground-work of his future ſtudies. In the year 1694, Mr. Keill went with his tutor to Oxford, entered himſelf of Baliol college, and read lectures himſelf in his own chambers upon natural and experimental philoſophy, by which he acquired conſiderable reputation. As an author, he firſt appeared with an "Examination of Dr. Burnet's Theory of the Earth," which led to a more extended controverſy on the ſubject: in this he diſplayed very commanding talents, and ably refuted the ingenious theories of Dr. Burnet and Mr. Whiſton. He readily admitted that though the work, the errors of which he undertook to expoſe, was full of miſtakes in philoſophy, yet none ever abounded with more beautiful ſcenes and ſurpriſing images of nature. In 1700, he ſucceeded Dr. Millington, who was appointed phyſician in ordinary to the king, as Sedleian profeſſor of natural philoſophy, and read lectures in the public ſchools. He now removed to Chriſt-church college, and, in 1702, he publiſhed his treatiſe, intitled "Introductio ad veram Phyſicam," containing the ſubſtance of ſeveral lectures on the new philoſophy. This work met with a favourable reception in his own and in foreign countries, and was conſidered as a good introduction to the Principia. In 1736, a new edition of it was printed in London at the wiſh of M. Maupertuis, who ſubjoined to it a new hypotheſis of his own concerning the ring of the planet Saturn. In 1708, Mr. Keill was elected a member of the Royal Society, of which he proved himſelf a very uſeful member, and enriched the Tranſactions of the Society with many valuable papers. In the following year he made a voyage to New England, as treaſurer of the Palatines who were ſent by government into that country, and ſoon after his return, in the following year, he was choſen Savilian profeſſor of aſtronomy. Mr. Keill next engaged in the controverſy reſpecting ſir Iſaac Newton's claim to the invention of fluxions: ſeveral letters paſſed on the ſubject between M. Leibnitz and our author; till at length a ſpecial committee of the Royal Society was appointed to examine the merits of the caſe, which committee concluded their report with declaring, that they reckoned ſir I. Newton the firſt inventor of the method in queſtion, and that they were alſo of opinion that Mr. Keill, in aſſerting the ſame, had been no ways injurious to M. Leibnitz. The particulars of theſe proceedings may be found in a work to which we have, in this Cyclopedia, already more than once referred; *viz.* the "Commercium-Epiſtolicum" of Mr. Collins. The diſpute was carried on for ſome years in the "Acta Eruditorum," and the "Journal Litteraire." It was generally admitted that Mr. Keill conducted himſelf in theſe conteſts with a great degree of firmneſs and ſpirit, and that he ſatiſfactorily repelled the attacks upon the reputation of our illuſtrious countryman. In 1711, he publiſhed a paper in the Philoſophical Tranſactions, "On the Rarity of Matter, &c." in which he points out various phenomena which cannot be explained upon the ſuppoſition of a plenum. About this time queen Anne was pleaſed to appoint him to the office of decypherer to her majeſty, in which he continued till the year 1716. In 1713, the univerſity of Oxford conferred upon him the diploma of doctor of medicine, and two years afterwards he publiſhed an edition of Euclid, to which he added two tracts on Trigonometry and the Nature of Logarithms. In the year 1718, Dr. Keill publiſhed at Oxford his "Introductio ad veram Aſtronomiam," which was afterwards tranſlated by himſelf into Engliſh, at the requeſt of the ducheſs of Chandos, under the title of "An Introduction to the true Aſtronomy," &c. The author did not long ſurvive this work. He died of a fever in the ſummer of 1721, being only in the 50th year of his age.

KEILL, JAMES, an eminent phyſician, was born in Scotland on the 27th of March 1673. Having received the early part of his education in his native country, he went abroad with the view of completing it in the ſchools of celebrity on the continent; and obtained ſuch a degree of knowledge as diſtinguiſhed him ſoon after his return to England. He had early applied to diſſections, and purſued the ſtudy of anatomy, under Duverney, at Paris; whence he was enabled to give anatomical lectures, with great reputation, in both the Engliſh univerſities. He was honoured with the degree of M.D. by the univerſity of Cambridge. In 1703 he ſettled at Northampton, and began the practice of his profeſſion, in which he attained conſiderable fame and ſucceſs. In 1706 he publiſhed a paper in the Philoſophical Tranſactions, N° 306, containing "an account of the death and diſſection of John Bayles, of that town, reputed to have been 130 years old." The circumſtances which he detailed very much reſembled thoſe that were obſerved by the celebrated Harvey in the diſſection of old Parr. Dr. Keill, like his brother John, was well ſkilled in mathematical learning, which he applied to the explanation of the laws of the animal economy. His firſt publication was a compendium of anatomy, for the uſe of the pupils who attended his lectures, and was entitled, "The Anatomy of the Human Body abridged," 12mo. Lond. 1698, and was taken chiefly from Cowper: it went through many editions. In the year 1708, he gave the world a proof of his mathematical ſkill, in "An Account of Animal Secretion, the Quantity of Blood in the Human Body, and Muſcular Motion," Lond. 8vo. This work was reprinted in 1717, with the addition of an eſſay, "concerning the Force of the Heart in driving the Blood through the whole Body," and under the title of "Eſſays on ſeveral Parts of the Animal Œconomy." He likewiſe publiſhed the ſame treatiſe in Latin, with the addition of a "Medicina Statica Britannica." The eſſay concerning the force of the heart drew him into a controverſy with Dr. Jurin, which was carried on in ſeveral papers, printed in the Philoſophical Tranſactions of the Royal Society, of which Dr. Keill had been elected a member; and was continued to the time of the death of the latter, which took place at Northampton, on the 16th of July 1619, in the vigour of his age. He had for ſome time laboured under a very painful diſorder, *viz.* a cancer in the roof of his mouth, to which he had applied the cautery with his own hands, in order, if poſſible, to procure ſome relief, but in vain. Eloy. Dict. Hiſt. Hutchinſon's Biog. Med.

KEILLESAY, in *Geography*, one of the ſmaller Weſtern iſlands of Scotland; 3 miles N.E. of Barray iſland. N. lat. 57° 2'. W. long. 7° 23'.

KEIM-HOTUN, a town of Chineſe Tartary, in the government of Kirin. N. lat. 44° 45'. E. long. 129° 24'.

KEIRAN, in the *Oriental Learning*, the Perſian and Arabic name for the planet Saturn, according to Salmaſius. See CHIUN.

KEIRLEBERUS, JOHN GEORGE, in *Biography*, born at Würtemberg, was at once a philoſopher, poet, and muſician. In 1691, he compoſed for the birth-day of the emperor Joſeph I. a Latin poem, which he ſet to muſic in a perpetual canon of 16 vocal parts, and 16 violin accompaniments, in a different melody; a piece of pedantry much admired by profeſſors and deep dilettanti at the latter end of the 17th century. He afterwards compoſed another perpetual canon in eight parts, four viol da gambas, two counter-tenors, and two tenors, with ſeveral other various and complicated contrivances, as myſtical, and as much reſpected at the time as the oracles delivered by the Pythia.

KEIS Bay, or *Sinclair's Bay*, in *Geography*, a bay on the E. coaſt of Scotland, in the county of Caithneſs. N. lat. 58° 28′. W. long. 2° 58′.

KEISER, Reinhard, in *Biography*, a German compoſer of the firſt claſs, for invention, ingenuity of accompaniments, and number of his works. This admirable muſician was born in 1673, at Weiſſenfels in Saxony, and, very early in his profeſſional career, appointed maeſtro di cappella to the duke of Mecklenburg. Though his firſt attempt at dramatic muſic was a paſtoral, called "Iſmena," for Wolfenbuttle, which he ſet in his 20th year, the year following he compoſed his opera of "Baſilius," which was performed in the theatre at Hamburgh with very great applauſe; and he continued writing for that ſtage till the year 1739.

He was educated at Leipſic, where he was entered of that univerſity. He began to ſtudy muſic in that city, but was chiefly his own maſter, forming himſelf upon the Italian ſchool, by ſtudying the beſt productions of that country. His ſecond opera for Hamburgh, "Adonis," eſtabliſhed him in the favour of that city for the reſt of his life. According to Mattheſon, whatever words he ſet on the ſubject of love, his muſic was peculiarly excellent. His operas, in Hamburgh alone, amounted to 118. But beſides his dramatic productions, he compoſed *divertimenti*, *ſerenate*, and *cantatas* innumerable. Indeed, this maſter was as ſure of fancy and originality whenever he put pen to paper, as Haydn in his time. In a manuſcript collection of near ſeventy cantatas by the greateſt compoſers of his time, both of Italy and Germany, in which there are twelve by Keiſer, in opening the book by chance, in any part of it where his cantatas are inſerted, it is inſtantly known to be his muſic, at the firſt glance; ſo new are the paſſages, and ſo different the arrangement of the notes from that of his companions in this collection, amounting to near thirty of the firſt order. For grace and facility we do not recommend him: indeed, theſe excellencies were little known or ſought during his time; but for modulation, ingenuity, and new ideas, he had ſcarcely his equal.

In a converſation with the elegant and judicious Haſſe at Vienna in 1772, he aſſured us that, according to his conceptions, Keiſer was one of the greateſt muſicians the world ever ſaw. His compoſitions, he ſaid, were more voluminous than thoſe of Aleſſandro Scarlatti; and his melodies, though then 70 years old, were ſtill, he thought, modern and graceful. Adding, that this had been always his opinion; and he was not likely to be prejudiced in his favour, as Keiſer was not his relation, his maſter, or even his acquaintance; but having lately looked at ſome of his works, he was aſtoniſhed to ſee ſo much more elegance, clearneſs, and pleaſing melody than are to be found in the productions of moſt modern maſters, even now. "He compoſed, indeed, chiefly for Hamburgh," Signior Haſſe obſerved, "and, in general, to the German language, not being very well verſed in that of Italy; ſo that he often blundered in ſetting Italian words; but he had always merit of other kinds to compenſate for this defect."

At this time all our own knowledge of this compoſer was traditional, as we were then totally unacquainted with his works; but we can now ſpeak from demonſtration, and our own examination of his works of various kinds, which manifeſt all the vigour of a fertile invention, and correctneſs of ſtudy and experience.

Keiser's *River*, in *Geography*, a river of Africa, at the Cape of Good Hope, which deſcends from Table mountain.

KEISKAMMA, a river of Africa, which runs into the Indian ſea, S. lat. 32° 44′.

KEITH, James, in *Biography*, a diſtinguiſhed general, younger ſon of George Keith, earl marſhal of Scotland, by a daughter of Drummond, duke of Perth, was born in 1696, and educated at the college of Aberdeen. He was an adherent to the Stuart family, and engaged in their defence in the year 1715; but on the defeat of his party he was glad to eſcape to France, where he applied to all the branches of knowledge uſeful in the military profeſſion. He was admitted a member of the Academy of Sciences on account of his great proficiency in mathematics. He travelled through many countries in Europe, ſerved 10 years in the Iriſh brigades in Spain, and afterwards entered into the Ruſſian ſervice, in which he was raiſed to the rank of brigadier-general. In the war between the Ruſſians and the Turks he gave the moſt ſignal diſplays of courage and heroiſm, and was himſelf the firſt to mount the breach at the capture of Otchakof. He had a ſhare in the war in Finland, between the Swedes and Ruſſians, and was inſtrumental in placing the princeſs Elizabeth on the throne of Ruſſia. At the peace of Abo in 1743, he was ſent ambaſſador to the court of Stockholm, and on his return to Peterſburgh he was honoured with the marſhal's ſtaff; but as the emoluments of this office were inſufficient for his ſupport, he accepted an invitation from Frederick king of Pruſſia, by whom he was honoured with conſiderable appointments, and with his own perſonal friendſhip. In the war of 1756 he entered Saxony in the quality of field-marſhal; and in 1758 he was killed, at the ſurpriſe of the camp of Hochkirchen, by count Daun. He was reckoned a very able general, and was highly eſtimable in his private character. The king of Pruſſia honoured his memory with a fine monument at Potzdam.

Keith, in *Geography*, a pariſh in the county of Banff, Scotland, contains four hamlets or villages: 1ſt, the old town of Keith; 2d, the new town of Keith; 3d, the new town of New-Mill; and, 4th, the old town of New-Mill. The old town is nearly deſerted by the inhabitants in conſequence of the ſuperior advantages of the new town. This was commenced in the year 1750, by the earl of Findlater, upon a barren moor, which was let in lots of 30 feet by 70. Here ſeveral manufacturers eſtabliſhed themſelves, and the place gradually increaſed in houſes and population. In 1791 there were 1075 of the latter; and in 1800 the whole pariſh contained 749 houſes, and 3284 inhabitants. Theſe are compriſed within an area of about ſix miles in length, by ſix in breadth. Flax-dreſſing, ſpinning, and weaving, are the chief branches of manufacture: a tannery, diſtillery, and bleaching-field, are included within the pariſh. The pariſh-ſchool of Keith has been long noted for its able maſters. Near old Keith, the river Iſla, falling over ſome high rocks, forms a fine caſcade, called the "Linn of Keith." James Ferguſon, juſtly celebrated for his aſtronomical and philoſophical writings, was a native of this pariſh. Within the precincts of the pariſh are ſome druidical remains. Sinclair's Statiſtical Account, vol. v. article written by the Rev. Alexander Humphrey.

KEKI, a town of Japan, in the iſland of Ximo; 15 miles N.N.W. of Naka.

KEKIO. See Fern-*Oil*.

KEKO, in *Geography*, a town of Hungary, with a caſtle; 15 miles S.E. of Korpona.

KELA, or Quilla, a town of Africa, on the Slave coaſt, in the canton of Koto.

KELAIA, a town of Arabia, in the province of Hedsjas; 50 miles E.S.E. of Calaat el Moilah.

KELANG, or Kilang, a ſmall iſland in the Eaſt Indian ſea, near the W. coaſt of the iſland of Ceram. S. lat. 3° 8'. E. long. 128°.

KELAR, a town of Perſia, in Irak; 70 miles E.S.E. of Caſbin.

KELAT, a town of Perſia, in the province of Khoraſan, at the edge of a mountain ſurrounded by rocks: it was taken by Timur Bec in 1382; 12 miles E. from Abiverd.

KELES, a town of Aſiatic Turkey, in Natolia; 28 miles E.N.E. of Epheſus.

KELHEIM, a town of Bavaria, ſituated on an iſland formed at the conflux of the Altmuhl and Danube; 46 miles N.N.E. of Munich. N. lat. 48° 52'. E. long. 11° 52'.

KELIUB, or Kaljub, a town of Egypt, on the Kalit's Abu Meneggi, the capital of a diſtrict; 6 miles N. of Cairo.

KELL, in *Rural Economy*, a web, or kind of bag, in which inſects are bred.

KELLAH, in *Geography*, a town of Abyſſinia; 75 miles E. of Axum.

KELLER, John Balthasar, in *Biography*, a celebrated artiſt, was born at Zurich in 1638. Having learnt the art of a goldſmith, in which he diſplayed great ingenuity, he went to Paris by the invitation of his brother, who held the poſts of canon-founder, and commiſſary of artillery to the king of France. While in the French ſervice he caſt a great many cannon, together with ſeveral ſtatues for the gardens of Verſailles; but that by which he is chiefly celebrated is the grand equeſtrian ſtatue of Lewis XIV. executed after the model of Girardon. He was made inſpector of the foundery at the arſenal, and died at Paris in the year 1702. Gen. Biog.

Keller, Godfrey, a native of Germany, who ſettled in England about the beginning of the laſt century, and had much practice as a harpſichord maſter. In 1711, he publiſhed, at Amſterdam, ſix ſonatas, engraved on copperplates; of which the three firſt were for two violins, a tenor, a trumpet or hautbois, and a baſs; the three laſt for two flutes, two hautbois or violins, and a baſſo continuo. Theſe the author dedicated to queen Anne. After this he and Finger publiſhed ſonatas, jointly, in five parts.

As a compoſer, Keller was ſoon forgotten; but he was remembered a conſiderable time as the author of a poſthumous treatiſe on *thorough-baſe*, which he had finiſhed, but did not live to publiſh. It was, however, printed, a ſhort time after, by Cullen at the Buck, between the Temple gates and Fleet-ſtreet, with the following ample title: "A complete Method for the attaining to play a Thorough-Baſe upon either Organ, Harpſichord, or Theorbo-Lute; by the late famous Mr. Godfrey Keller, with Variety of proper Leſſons and Fugues, explaining the ſeveral Rules throughout the whole Work; and a Scale for tuning the Harpſichord or Spinet, all taken from his own Copies, which he did deſign to print."

This treatiſe, though meagre, was the beſt our country could boaſt, till Lampe, in 1737, publiſhed his "Plain and Compendious Method of teaching Thorough-Baſe, after a moſt rational Manner, with proper Rules for practice; the Examples and Leſſons curiouſly engraved on Copperplates." Of this work we ſhall ſpeak hereafter. See Lampe.

KELLERAMPT, in *Geography*, a bailiwick of Switzerland; in the canton of Zurich, of which Bremgarten is the principal place.

KELLEY, Edward, in *Biography*, the aſſociate of Mr. Dee (to whoſe article the reader is referred), in his incantations, was born at Worceſter in the year 1555. He was educated in grammar learning in his native city, and at the age of ſeventeen he was ſent to the univerſity of Oxford. According to Anthony Wood he left Oxford very abruptly, and in his peregrinations behaved ſo ill, and committed ſo many foul matters, that at Lancaſter he was for ſome offence deprived of his ears. After this he became acquainted with Mr. Dee, and, as we have ſeen, they ſet out for the continent. For ſome time Kelley lived in a very expenſive ſtyle, ſupported, probably, by the contributions which he levied on the credulous, till he was ordered into confinement by the emperor Rodolph. He obtained his releaſe, and conciliated the favour of the prince, who conferred on him the honour of knighthood. Freſh diſcoveries of his knavery occaſioned a ſecond impriſonment, and in attempting to eſcape from the place of his confinement, he met with an accident which put an end to his life in the year 1595. He was author of ſeveral works, of which "A Poem on Chemiſtry," and another on "The Philoſopher's Stone," were inſerted in Aſhmole's "Theatrum Chymicum Britannicum." He publiſhed at Hamburgh, in 1676, a treatiſe, "De Lapide Philoſophorum:" he was author, likewiſe, of "A True and faithful Relation of what paſſed, for many Years, between Dr. John Dee and ſome Spirits, &c." Several of his MSS. are ſtill preſerved in the Aſhmolean Muſeum, at Oxford. Wood's Athen.

Kelley, Hugh, a dramatic writer, was a native of Ireland, and bred a ſtay-maker, which profeſſion he quitted when he came to London, and became writer to an attorney. He afterwards obtained a livelihood by his pen, and was author of the following pieces: "Falſe Delicacy;" "A Word for the Wiſe;" "The School for Wives;" "The Romance of an Hour." Theſe, as their titles denote, are all comedies. He was author alſo of "Clementina," a tragedy; "Theſpis," a poem; "Memoirs of a Magdalen;" "The Babbler;" and a collection of Eſſays. He died in the year 1777.

KELLI, in *Geography*, a town and fortreſs of Hindooſtan, in the country of Tanjore; 27 miles S. of Tanjore. N. lat. 10° 20'. E. long. 79° 7'.

KELLINORE, a town of Hindooſtan, in the Carnatic; 10 miles N. of Pondicherry.

KELLS, a market and poſt-town of the county of Meath, province of Leinſter, Ireland. It was in former times a city of note, and on the arrival of the Engliſh was walled and fortified with towers: a caſtle was built in 1178, and there were ſeveral religious houſes. It was alſo a borough town, which, before the Union, ſent two burgeſſes to parliament. Kells is 32 miles N.W. from Dublin on the river Blackwater, and nearly eight from Navan.

KELLY, Earl of, in *Biography*, an illuſtrious dilettante muſician, in whom were united application, genius, and a powerful hand on the violin. This nobleman went through all the gradations of ſtudy neceſſary to form a profound contrapuntiſt. When he quitted Great Britain to make the tour of Germany, according to Pinto, he could ſcarcely tune his violin; but ſtopping at Manheim, he heard the beſt inſtrumental muſic in Europe, and ſhut himſelf up with the elder Stamitz, whoſe originality and fire ſet his young pupil in a blaze, and ſo congenial were the taſte and diſpoſition of the ſcholar and the maſter, that they ſeemed the growth of the ſame ſoil. The ſame energy and enthuſiaſm which had lifted Stamitz above his fellows of the Manheim ſchool, ſtimulated the young earl to ſtudy compoſition, and practiſe the violin with ſuch ſerious application, that, on his return to England, there was no part of theoretical or practical muſic in which he was not equally verſed with the greateſt profeſſors of his time. Indeed, he had a ſtrength of hand on the violin, and a genius for compoſition, with which few profeſſors are gifted. His ear was ſo correct, and his perception ſo acute, that in the midſt of a turbulent and tumultuous movement of a ſymphony in twelve or fourteen parts, if any inſtrument failed either in time or tune, though playing a different and difficult part himſelf, he inſtantly prompted the erroneous performer with his voice, by ſinging his part without abandoning his own.

KELLYSBURG, in *Geography*, a townſhip of America, in Chittenden county, Vermont, at the head of the north branch of La Moille river.

KELMEE, a town of Hindooſtan, in the Baglana country, on the coaſt; 16 miles N. of Baſſeen.

KELMEBEK, a town of Natolia; 28 miles E. of Pergamo.

KELMO, a town of Sweden, in Eaſt Gothland; 23 miles N. of Linkioping.

KELNAR, a town of Caramania, near the coaſt of the Mediterranean; 12 miles W. of Selefkeh.

KELNER, in *Biography*, a German muſician, who came into England early in the laſt century, and performed on the double-baſe in the theatres and concerts of the time. Having attached himſelf to Dr. Pepuſch, his venerable countryman, it was found, at the doctor's deceaſe, that the moſt curious books and MSS. of his valuable library at the Charter-houſe, were bequeathed to Kelner and Travers, another of the doctor's conſtant attendants, who both dying ſoon after their bequeſt was known, that, and the remainder of the moſt curious and ineſtimable muſical library perhaps in Europe, were ſold piece-meal, diſpoſed of and embezzled, in a manner difficult to deſcribe or underſtand. See Pepusch, and *Muſical* Library.

KELP, in *Agriculture* a term applied to the mineral alkali in its more impure ſtate; the kelp of commerce contains the aſhes of the plant that affords it, and is found to be a good manure. See Carbonat *of* Soda.

KELSAL'S Island, in *Geography*, a ſmall iſland in the Mergui Archipelago, ſeparated from the S.E. extremity of the iſland of St. Suſanna, by Alderſey's ſtraits. N. lat. 10° 27'.

KELSO, a town in the county of Roxburgh, Scotland, is built on a ſpot where the rivers Tevid and Tweed unite their ſtreams, and is nearly ſurrounded with eminences covered with trees. Hence the ſcenery is particularly picturesque and pleaſing. The houſes are arranged round a large ſquare, and on the ſides of ſix ſtreets, which diverge from the ſquare in nearly a regular and uniform manner. The town-houſe, with ſhops and ſome of the principal dwellings, are in the ſquare. In the town are the pariſh-church and an epiſcopal chapel, which are deſcribed as handſome ſtructures. Among the public buildings are a diſpenſary, a public ſubſcription library, and a modern bridge over the Tweed, erected in the place of a former one, ſwept away by a flood in 1798. A church was founded here in 1138; and a monaſtery was transferred from Selkirk to this place by David I., who "conferred on the monks this village, with its lands and waters, free from all exaction." David II. granted to the abbot a free-market here. "The town of Kelſo ſhared the fate of the abbey during the hoſtile conflicts between the kindred nations in being often plundered and ſometimes fired." In the years 1522, 1542, and 1544, it was greatly damaged from the border warriors. The town was almoſt deſtroyed in 1686 by an accidental fire, and about the middle of the laſt century, it ſuſtained great damage from the ſame cauſe.

David II. conſtituted the town of Kelſo, with the barony of Bolden, and other lands, a free regality. This was converted, in 1607, into a lordſhip in favour of Robert Kerr, earl of Roxburgh. The duke of Roxburgh is proprietor of the lands here. The principal trade of Kelſo is the manufacture of woollen cloth, and dreſſing of ſheep and lambs' ſkins, of which it is ſuppoſed that from 70,000 to 80,000 are annually exported. Great numbers of boots and ſhoes are annually made here. This place is much reſorted to by gentlemen who attend the "Caledonian hunt," and by others on account of the races. The abbey buildings of Kelſo have been very extenſive and grand. At preſent its ruined church preſents many intereſting fragments of Norman architecture. Mr. Pennant remarks, that the "environs of Kelſo are very fine, and the inhabitants have much reaſon to boaſt of their proſpects." In the vicinity of the town are ſeveral ſeats of the nobility and gentry: Fleurs, "the magnificent ſeat" of the duke of Roxburgh; Springwood-park, the reſidence of ſir George Douglas, bart.; Softlaw-tower, Mr. Proctor's; Roſe-bank, captain Scott's; Pinnacle-hill, Mr. Davidſon's; Wooden, Mr. Walker's; &c. In 1800, Kelſo contained 527 houſes, and 4196 inhabitants. Chalmers's Caledonia, vol. ii. Sinclair's Statiſtical Account, vol. x. p. 576. Pennant's Tour to Scotland.

KELTAN, a town of Thibet; 40 miles E.N.E. of Laſſa.

KELTANPUSUACLIAN, a town of Thibet; 52 miles W. of Sgigatche.

KELTSCH, a town of Moravia, in the circle of Prerau; 14 miles E. of Prerau.

KELVAN, a town of Perſia, in Farſiſtan; 18 miles E.N.E. of Schiras.

KELVEH, a town of Perſia, in the province of Mecran, on the Nehenk; 280 miles S.E. of Zareng. N. lat. 28° 50'. E. long. 65° 48'.

KELVIN, a river of Ireland, in the county of Londonderry, which runs into the Roe, about 4½ miles S. from Newtown Limavaddy.

KELVIO, a town of Sweden, in the province of Ulea; nine miles E.N.E. of Gamla Karleby.

KELWAY, Joseph, in *Biography*, the beſt extemporaneous performer on the organ, and neateſt harpſichord player among the natives of our own country, during the middle of the laſt century. He had been, early in his life, apprenticed to a dancing-maſter at Bath; but having attempted the harpſichord, and received a few leſſons from old Chilcot, he had made ſuch a progreſs on that inſtrument, that Geminiani, happening to hear him, diſcovered a hand and diſpoſition ſo promiſing, that he not only encouraged him to ſtudy muſic as a profeſſion, but gave him inſtructions. And his ſtyle of playing ever after more reſembled the compoſitions of Geminiani than thoſe of Handel, which all other organiſts ſervilely copied. The broken phraſes and rhapſodical flights of Geminiani often ſeem more like voluntary playing than regular compoſition. Stanley's voluntaries were ſo ſmooth and well-phraſed, that they ſeemed pieces played by memory; but Kelway's extempore playing, in the ſtyle of Geminiani, never had the air of ſtudied pieces.

In removing from Bath to London, Kelway was ſoon noticed, and elected organiſt of St. Michael's, Cornhill, where he did not long remain; for on the death of Weldon, he reſigned the organ at St. Michael's church to Mr., afterwards Dr. Boyce; and was elected organiſt of the king's pariſh church, St. Martin's-in-the-Fields, where, of a Sunday afternoon, it was the cuſtom, not only for young organiſts, but the principal profeſſors, to crowd under the organ-loft to hear his voluntaries; in which there was an original and maſterly wildneſs, which long ſupported his character as a great player, in a ſtyle totally different from other organiſts; bold, rapid, and fanciful.

With his harpſichord playing we were unacquainted; but we have often been aſſured, that he conſtantly kept in high practice, Scarlatti's beſt and moſt difficult leſſons, which he executed in a manner peculiarly neat and delicate. As to compoſition, it is to be lamented that he did not exerciſe his pen and fancy more early in life, or that he ever attempted it at all: for on the arrival of Bach, and appointment at court as chamber-muſician to the queen, to whom he dedicated his firſt publication in this country, Mr. Kelway thought it neceſſary, as muſic-maſter to her majeſty, to publiſh a book of harpſichord leſſons, which are, perhaps, the moſt crude, aukward, and unpleaſant pieces of the kind that have ever been engraved. There is a manifeſt want of facility and experience, which proves, that though he was old in practical muſic, he was young in its theory and in compoſition.

Handel, who uſed to go frequently to St. Martin's church to hear him play, always, when indiſpoſed, requeſted Kelway to play the organ for him in his oratorios.

This admirable performer, the moſt brilliant we ever heard, in point of fancy and finger, lived to a great age, but, unhappily, during the laſt years of his life, his intellects were ſomewhat deranged. He died in 1782, and was ſucceeded at St. Martin's church by Dr. Benjamin Cook, organiſt of Weſtminſter Abbey.

KEMA, in *Geography*, a town on the E. coaſt of the iſland of Celebes. N. lat. 1° 8'. E. long. 125° 2'.

Kema, in *Natural Hiſtory*, a name given by Leo Africanus, and other writers of the African hiſtory, to a ſort of ſubterranean production of the vegetable kind, greatly eſteemed as a delicious food. The Arabian writers on medicine have often mentioned it, and that under names ſufficiently reſembling the modern African appellation, ſuch as *camahe*, *camah*, *kemah*, and *camha*. They are not the roots of any plant, but a fine kind of ſubterraneous muſhroom, or truffle, white on the outſide, and which lie generally pretty deep in the earth.

KEMAOON, in *Geography*, a ſmall ſtate, which, with others, forms a tract of country ſeparated from Hindooſtan by lofty mountains, and ſituated to the N. of Oude and Rohilcund.

KEMAR, a town of Aſiatic Turkey, in Natolia; eight miles S. of Sinob.

KEMBELA, a town of Sweden, in the government of Ulea; five miles S. of Ulea.

KEMBERG, a town of Saxony; ſix miles S. of Wittenberg.

KEMER, a town of Aſiatic Turkey, in the government of Trebiſond; 12 miles E.N.E. of Rizeh.

KEMGUR, a town of Hindooſtan, in Bahar; 27 miles N.N.E. of Durbunga.

KEMI, a town of Ruſſia, in the government of Olonetz, at the mouth of the river Kem, on the W. of the White ſea. N. lat. 64° 55'. E. long. 28° 38'.—Alſo, a ſea-port town of Sweden, in Eaſt Bothnia, ſituated on the right bank of the river Kemi, which runs into the gulf of Bothnia, about three miles from its mouth; 10 miles E. of Tornea. N. lat. 66° 49'. E. long. 24° 27'.

KEMIJAN, a town of Hindooſtan, in Bahar; 31 miles S.S.W. of Patna.

KEMITRASK, a town of Sweden, in Eaſt Bothnia, at the N. extremity of a conſiderable lake formed in the river Kemi; 90 miles N.E. of Kemi. N. lat. 66° 42'. E. long. 27° 14'.

KEMLIK, or GHIO, a town of Aſiatic Turkey, on the bay of the ſea of Marmora; 20 miles W. of Iſnik.

KEMMOO, a town of Africa, the metropolis of Kaarta; formerly large and populous, but deſtroyed ſince it was viſited by Mr. Park. N. lat. 14° 20. W. long. 7° 46'.

KEMNAT, a town of Bavaria; 26 miles N. of Amberg. N. lat. 49° 53'. E. long. 11° 55'.

KEMNITZ, a town of Sileſia, in the principality of Jauer, on a river of the ſame name, which runs into the Bober; ſix miles W. of Hirſchberg.

KEMPACH, a town of Tyrol; ſix miles N.W. of Schwas.

KEMPEN, a town of France, in the department of the Roer, and chief place of a canton, in the diſtrict of Creveldt; 15 miles N.E. of Ruremond. The place contains 2870, and the canton 12,830 inhabitants, in 12 communes. It formerly contained a college and three convents, with ſome linen manufactures.—Alſo, a town of the duchy of Warſaw; 26 miles S. of Siradia.

KEMPFERA, in *Botany*, ſo named by Houſtoun, in honour of Dr. Engelbert Kempfer, or rather Kæmpfer, the celebrated traveller and naturaliſt. See VERBENA, and KÆMPFER.

KEMPIS, THOMAS à, in *Biography*, was born in the year 1380, at a village in the dioceſe of Cologne, whence he derived his ſurname. The circumſtances of his parents were ſuch as led them to ſeek for him an education on a charitable foundation. At this place he was diſtinguiſhed for his talents, piety, and attachment to a contemplative life. He entered the monaſtery of Mount St. Agnes, received the habit in 1406, and was ordained prieſt in 1423. He occaſionally filled very important poſts of his order, though it was much againſt his will that he engaged at all in the active duties of life. He died in 1471, at the advanced age of ninety-two. His works are chiefly devotional, and written in an animated ſtyle. The moſt complete edition of them is in three volumes, octavo, publiſhed at Antwerp in 1600, and in 1615. Many of them have been tranſlated into a variety of languages, particularly that entitled "De Imitatione Chriſti," which is to be found in almoſt every known tongue in the world. The beſt Engliſh verſion is that by Dr. George Stanhope, which was printed in 1696, and has been ſeveral times reprinted. The learned are not agreed as to the real author of this celebrated work, though given to Thomas à Kempis by general conſent, many have offered reaſons why he cannot be the writer. The queſtion was warmly agitated for ſixty years, and gave riſe to many curious diſcuſſions, an account of which is given by Dupin.

KEMPSVILLE, in *Geography*, a poſt-town of America, in Prince Ann county, Virginia; 243 miles from Waſhington.

KEMPTEN, a town of Bavaria, on the river Iler, lately Imperial. The burghers and magiſtracy profeſs Lutheraniſm, and in the town are a handſome pariſh church and a grammar ſchool. In 1801, this town and its abbey were given to the elector of Bavaria; 36 miles S. of Augſburg. N. lat. 47° 43'. E. long. 10° 17'.—Alſo, a princely abbey, founded, or at leaſt repaired and enriched, by Hildegard, wife of Charlemagne, in the 8th century. To this abbey belonged ſome towns and villages.

KEMSER, a town of Bengal; 15 miles S.S.E. of Curruckpour.

KEMSKOI, a town of Ruſſia, in the government of Tobolſk. N. lat. 57° 25′. E. long. 92°.

KEN, Thomas, in *Biography*, an Engliſh prelate, was born at Berkhamſtead, in Hertfordſhire, in the year 1637. He received his claſſical education at Wincheſter ſchool, was elected ſcholar, and removed in due time to New-College, Oxford, of which he was choſen fellow. After taking his degrees he entered into holy orders, and became chaplain to lord Maynard, comptroller of the houſhold to king Charles II. In 1666, he was choſen fellow of Wincheſter college, and in a ſhort time afterwards was appointed domeſtic chaplain to Dr. Morley, biſhop of Wincheſter, from whom he received a preſentation to the rectory of Brixton, in the Iſle of Wight, and afterwards, in 1669, to a prebend in the church of Wincheſter. About the year 1673, the ſame friend and patron gave him the rectory of Woodhey, in Hampſhire, which, however, he ſoon reſigned, conceiving that he ought to be ſatisfied with the emoluments which he had previouſly poſſeſſed. In 1675, he went, in company with his nephew, Mr. Iſaac Walton, to Rome, and on his return he uſed to ſay he was grateful for the effect produced by the journey, inaſmuch as he was more ſtrongly confirmed in his belief of the excellence of the reformed religion, by witneſſing the abſurdities of the ſuperſtitions practiſed abroad. In 1679, he took his degree of doctor of divinity, and being appointed chaplain to the princeſs of Orange, he went to Holland. He diſcharged the duties of his office with ſo much prudence and zeal, as to ſecure the eſteem and confidence of his royal miſtreſs, but he incurred the temporary diſpleaſure of her conſort, afterwards William III. of England, by obliging one of his favourites to fulfil his engagement to a young lady of the princeſs's train, whom he had ſeduced under a promiſe of marriage. On his arrival in England he was appointed chaplain to lord Dartmouth, who received a commiſſion to demoliſh the fortifications of Tangiers, and on his return from this expedition, he was immediately advanced to be chaplain to the king, by an expreſs order from his majeſty, who hoped thereby to render him ſubſervient to his meaſures, and to the laxity of his morals. When the court removed to Wincheſter, the ſovereign deſired Dr. Ken to admit into his prebendal houſe Eleanor Gwyn, one of the king's miſtreſſes, but he poſitively refuſed to ſubmit to an arrangement which might appear to give countenance to vice; and Charles, ſo far from being offended with this deciſive proof of religious intrepidity, took an early opportunity of raiſing him to the epiſcopal bench, by preſenting him with the ſee of Bath and Wells. Within a few days of this appointment the king was attacked by his laſt illneſs, during which the biſhop attended him in the moſt ſedulous manner, endeavouring, though, it is ſaid, ineffectually, to awaken the king's conſcience to a ſenſe of ſorrow for his paſt profligate life. Neverthelefs the biſhop did not heſitate to pronounce abſolution over his majeſty without receiving any declaration of repentance, for which he has been deſervedly cenſured; though it is to be feared, that almoſt all death-bed repentances, being the effect of dread of the future, can avail the ſuppoſed penitents very little with regard to a future ſtate. The biſhop was exemplary in performing the duties of his ſtation, and was inceſſantly deviſing means for relieving the poor, and inſtructing the ignorant. With this view he built the firſt workhouſe at Wells, which has proved the model for numbers that have been erected ſince his time; and he eſtabliſhed many ſchools in all the great towns of his dioceſe. To theſe, and many other ſimilar objects, Dr. Ken devoted the principal part of the income of his ſee. He was a warm friend to the doctrine of paſſive obedience and non-reſiſtance, and on that account was at firſt well received by James II., but when that prince endeavoured to introduce popery as the eſtabliſhed religion of the country, he found it expedient to act upon more conſtitutional grounds, and to oppoſe the meaſures of the court with ſpirit and zeal. He was one of the ſeven biſhops ſent to the Tower for reſiſting that monarch's diſpenſing power, and for petitioning in behalf of their own and the people's rights. The biſhop and his brethren, though charged with high treaſon, were honourably acquitted, to the inexpreſſible joy of every friend to the country. At the Revolution he refuſed to transfer his allegiance to the new ſovereigns, and, declining to take the oaths required of him, was deprived of his biſhopric. He now lived a life of retirement, but conſidered himſelf ſtill as biſhop in right, though not in fact, conceiving that no human power could ſeparate him from the relationſhip which he bore to his dioceſe. Upon the death of his firſt ſucceſſor, Dr. Kidder, he urged Dr. Hooper, who had been nominated to the vacant biſhopric, to accept it, and ever afterwards ſigned himſelf "late biſhop of Bath and Wells." From this time the queen ſettled on him a penſion of 200*l.* per ann. which he enjoyed ſo long as he lived. He died, as he was on a journey to Bath, in March 1710-11, in the 74th year of his age. He had been in the habit of travelling many years with his ſhroud in his portmanteau, which he always put on when attacked by illneſs: of this he gave notice the day before his death, in order to prevent his body from being ſtripped. His works, which are all of a theological and practical turn, were collected, in 1721, in four volumes octavo. Biog. Brit.

Ken, in *Geography*, a town of Hindooſtan, in the province of Behker; 20 miles N. of Behker.—Alſo, a ſmall low iſland in the Perſian gulf, in which are a few ſhrubs. N. lat. 27° 54′. E. long. 50° 76′.

KENAMOW, a town of Hindooſtan, in Oude; 30 miles S.S.E. of Caunpour.

KENAPOOSSAN, a ſmall iſland in the Eaſt Indian ſea, in the Sooloo Archipelago. N. lat. 5° 12′. E. long. 120° 23′.

KENAREI-HAVAZ, a town of Hindooſtan, in Moultan; 20 miles E. of Batnir.

KENAWAS, a town of Hindooſtan, in the circar of Kitchwarah; 17 miles W. of Sheergur.

KENCHESTER. See Ariconium and Hereford.

KENDAL, or Kentdale, a market town and pariſh in the ward of Kendal, and county of Weſtmoreland, England, is built in a pleaſant valley on the weſtern banks of the river Kent, over which there are three bridges. The town conſiſts of one principal ſtreet running north and ſouth, with ſeveral ſmaller ones branching off at right angles. Kendal has long been famed for its manufacture of cottons. In the year 1800, Houſeman ſtates that the town contained 12 manufactories engaged in this buſineſs, and that about 1200 pieces of cotton were made weekly, each of which contained about 24 pounds of wool. The buſineſs was then increaſing. Eight houſes were alſo engaged in the linſey manufacture, and "ſeveral other manufactures of leſs conſequence are carried on. There are likewiſe a conſiderable number of perſons employed in working and poliſhing marble, which, in the beauty and variety of its colours, is thought by many to be ſuperior even to that imported from Greece and Italy. Mr. Wakefield manufactures large quantities of gunpowder at his mills a little below the town." The public buildings of Kendal are the church, a large and commodious workhouſe, and a bridewell. Near the church is a handſome houſe called Abbot-hall, the property of ſir Alan Chambre, one of the judges of the court of common pleas. To the eaſt of the town are the remains of a caſtle, which is ſuppoſed to have been built by the firſt barons of Kendal. It was formerly a place of conſiderable extent and ſtrength; but its towers and walls are much mutilated and reduced. Parts of two ſquare and two round towers, however, ſtill remain, as well as great part of the wall round the outer ballium. Another object of antiquity is an artificial mount, called by the inhabitants Caſtle-law-hill. In the town are chapels for Quakers, Methodiſts, Preſbyterians, and Roman Catholics. The chief manufacturers and tradeſmen of the town are united into twelve companies, each of which has a hall: *viz.* Mercers, Tanners, Glovers, Sheermen, Cordwainers, Taylors, Pewterers, &c. Kendal is 22 miles from Lancaſter, and 260 N. of London. In the year 1800 it contained 1424 houſes, and 6892 inhabitants. Nicholſon and Burn's Hiſtory of Weſtmoreland, &c. two vols. 4to.; and Houſeman's "Deſcriptive Tour through various Northern Counties," &c. 8vo. 1800.

KENDER, a town of Hindooſtan, in Sehaurunpour; 10 miles N. of Sehaurunpour.—Alſo, a town of Curdiſtan; 28 miles S.W. of Betlis.

KENDRICK's ISLAND, an iſland which forms the W. ſide of Nootka Sound, into which there is an entrance from the W. by Maſſachuſett's Sound, along the northern ſide of the iſland.

KENDUSKEAG, a river of America, which runs into the Penobſcot at the town of Bangor, about two miles below the head of the tide; where is a thriving village of handſome houſes, and a place of the greateſt trade in the river.

KENDY, a town of Bengal; 50 miles N.N.E. of Ramgur. N. lat. 24° 16′. E. long. 85° 6′.

KENE′. See CÆNE′ and GHINNA.

KENEF, a town of Perſia, in the province of Khoraſan; 45 miles N. of Herat.

KENERA, or KENEREH, a mountain on the iſland of Salſette, near Bombay, celebrated for the number and extent of its excavations. Its principal cavern is arched, in the ſtyle of that deſcribed under the article KARLY; and was evidently, from its ſtile of ſculpture, a temple of the god Budha, or Boodh. (See BOODH.) On each ſide of the veſtibule are ſtanding figures of the god, in eaſy attitudes, of tolerable proportions, and well ſculptured in alto-relievo, fourteen feet high. This cave and three figures are elegantly repreſented in Daniel's fine ſeries of oriental ſcenery. See KARLY.

KENFIG, or CYNFIG, a pariſh of Glamorganſhire, South Wales, is noticed in this work, chiefly to correct the errors of other topographical writings; in moſt of which it is deſcribed as a town. Mr. Donavan, in his "Deſcriptive Excurſions through South Wales," deſcribes it as a poor, ſmall village, inhabited moſtly by ſailors and ſmugglers, and repreſents theſe as being particularly rude and inſulting to ſtrangers. A cluſter of mean cottages, grouped together, with a church on a ridge of riſing ground, conſtitute this village. In this pariſh is Kenfig-pool, a lake of freſh water, which "is emboſomed in a depreſſion of an irregular form, in the midſt of ſands that have been apparently drifted upon this ſpot from the contiguous coaſt, and though lying within a very ſhort diſtance of the ſea at flood tide, invariably retains its freſhneſs pure and untainted by the muriatic properties of the former. The circumference of this pool is eſtimated at a mile and three quarters. The depth is great in ſome places. Indeed it has the reputation of being, in many parts, unfathomable." It is traditionally ſaid, that a town formerly occupied this ſpot, and that it was ſwallowed up by an earthquake. At a ſhort diſtance from this lake, on an eminence, are ſome ruins, called Kenſig-caſtle, which was only a ſmall fortreſs. In 1800, this pariſh contained 156 houſes, and 655 inhabitants.

KENGHEVAR, a town of Perſia, in Irak, on a river which runs into the Karaſu; 240 miles N. of Iſpahan. N. lat. 34° 20′. E. long. 47° 10′.

KENJAR, a town of Hindooſtan, in Bahar; 30 miles S.W. of Patna.

KENILWORTH, a market town and pariſh in the hundred of Knightlow and county of Warwick, England, is famed in the annals of the kingdom for its ancient caſtle, "which," ſays Dugdale, "was the glory of all theſe parts, and for many reſpects may be ranked, in a third place at the leaſt, with the moſt ſtately caſtles of England." This fortreſs was built by Geoffry de Clinton in the time of Henry I. He was chamberlain and treaſurer to that monarch. By ſubſequent kings and occupiers it was greatly enlarged and ſtrengthened at different times: and in the various civil and domeſtic wars of England, it was frequently the object of contention with different monarchs and nobles. To detail ſuch particulars would be foreign to the nature of this work; but the reader may find much curious and intereſting information relating to the ſame, in Dugdale's "Antiquities of Warwickſhire." What remains of the buildings ſhew that the whole was an immenſe and ſpacious pile: conſiſting of an outer wall with baſtion towers, a tilt-yard, with towers at each end; and ſeveral buildings within the ballium, or baſe-court. The area within the walls conſiſts of ſeven acres. There were four gatehouſes, and the walls were from ten to fifteen feet in thickneſs. At a ſhort diſtance from the caſtle was a priory for Black canons. Of the buildings, parts of the gateway and chapel remain. Near theſe is the pariſh church, the weſtern door-way of which is a curious ſpecimen of ancient architecture. In the town are two meeting-houſes, or chapels. Kenilworth is five miles from Warwick, and five from Coventry. In 1800, the town contained 418 houſes, and 1968 inhabitants. Dugdale's Antiquities of Warwickſhire.

KENKRI, a town of European Turkey, in Livadia; 40 miles W. of Athens.

KENKS, in the *Sea Phraſe,* are doublings in a cable or rope, when it is handed in or out, ſo that it does not run ſmooth, or when any rope makes turns, and does not run ſmooth and clever in the block, they ſay it makes kenks.

KENMARE TOWN, called *Nedeen,* in *Geography,* a poſt-town of the county of Kerry, province of Munſter, Ireland. It is ſituated at the north-eaſt extremity of an extenſive river or bay on the Atlantic ocean. Kenmare is 155 miles S.W. from Dublin, and 12 miles S. from Killarney.

KENMARE *River,* a river or arm of the Atlantic ocean, on the coaſt of Ireland, which extends about 20 miles in length, and about three in breadth, ſituated at the ſouth-weſt ſide of the county of Kerry. It affords a ſafe and capacious harbour, but little frequented. The mouth is ſituated in N. lat. 51° 40′. W. long. 9° 57′.

KENNEBECK, a river of America, which, next to Penobſcot, is the fineſt in Maine. Three miles from the mouth, the waters of the river are divided by Swan iſland, ſeven miles in length; on both ſides of which they are navigable: at the diſtance of 38 miles from the ſea is the iſland Nahunkeag, ſignifying the land where eels are taken. Within three miles of this iſland, a ſmall river, iſſuing from ponds in the town of Winthrop, runs into the Kennebeck, and it is known by the Indian name Cobbiſſeconteag, denoting the place where ſturgeons are taken. Six miles higher is the head of the navigable waters, which is a baſon four miles from the ſea, and commodious for the anchorage of veſſels. Where the navigation terminates ſtands Fort Weſtern, erected in 1752. From this fort to Taconnet Fall is a diſtance of 18 miles. On the eaſtern ſide of the river near the fall is Fort Halifax, erected in 1754, ſituated on the point of land where the Sabaſtacook makes an addition of one-third to the ſize of the Kennebeck. Thirty miles above Halifax fort Sandy river flows into the Kennebeck; and about 40 miles higher, the Kennebeck takes a S.W. courſe; and 50 miles from Halifax fort it receives the eaſtern branch. The main branch of the Kennebeck, in its courſe through the wilderneſs, forms ſeveral carrying places or portages. At about 100 miles diſtance from the mouth of the eaſtern branch, the ſource of the main or weſtern branch extends to a great diſtance along the ſide of the Chaudiere, which carries the waters from the highlands into the St. Lawrence. The eaſtern branch iſſues from a body of waters which lie N., about 20 miles from the confluence of the two branches. Theſe waters are called Mooſe pond, or lake. The ſides of the lake are very crooked, ſo that it forms an irregular figure, containing three times as much water as Lake George. To the N. and W. of the lake are high mountains, from which waters run by many channels to the St. Lawrence. The Kennebeck affords great quantities of lumber, and is inhabited, at different ſeaſons, by ſeveral ſpecies of valuable fiſh; particularly ſalmon and ſturgeon, ſhad, and alewives. This river forms the neareſt ſea-port for the people on the upper part of the river Connecticut. From the Upper Cohos, or Coos, on the latter river, to the tide water in Kennebeck, is a diſtance of 90 meaſured miles.—Kennebeck is alſo a county in the diſtrict of Maine, and the firſt inland county erected in this diſtrict. It was ſeparated from the maritime county of Lincoln, by which it is bounded on the S., by Hancock county on the E., by Cumberland on the W., and by the Highlands on the N. It was incorporated in February 1799, and derives its name from the river, which, paſſing through it, divides it nearly in equal parts. It is about 40 miles wide and upwards of 100 miles long. The ſoil is better and more eaſily cultivated than that on the ſea-coaſt. It contains 24,402 inhabitants.

KENNEBUNK, a river of Maine, having at its mouth a good harbour, whence great quantities of lumber are ſhipped. This river divides the townſhips of Wells and Arundel. After running a ſhort courſe, it diſcharges itſelf into the ſea between Capes Porpoiſe and Neddick.—Kennebunk is alſo the Indian name of the place, ſince called Wells, in Maine, about 33 miles below Portſmouth, in New Hampſhire; in which is a poſt-office.

KENNEDY's Creek, a river of Kentucky, which runs into the Ohio, N. lat. 58° 30′. W. long. 83° 36′.

KENNEL, a term uſed indifferently for a puddle, a water-courſe in the ſtreets, a houſe for a pack of hounds, and the pack or cry of hounds themſelves.

Among ſportſmen, a fox is ſaid to *kennel*, when he lies cloſe in his hole.

On a preſumption that a kennel for hounds is to be erected, its ſeite is thus deſcribed by Somerville:

> " Upon ſome little eminence erect,
> And fronting to the ruddy dawn; its courts
> On either hand wide opening to receive
> The ſun's all cheering beams, when mild he ſhines
> And gilds the mountain tops."

However, this ſelection of a high ſituation is incompatible with a running brook; and as theſe two advantages cannot be united, water is to be preferred, with the aſpect to the morning ſun as much attended to as poſſible. The number of its inmates muſt regulate the ſize of the kennel, and the architecture ſhould be neat without being uſeleſsly expenſive. The moſt magnificent is the duke of Richmond's, at Goodwood, which coſt 19,000*l.* and is ſufficiently extenſive for two packs of hounds. The building compriſes five kennels; two 36 by 15, three 30 by 15, and two feeding rooms 20 by 15 feet, with ſtoves for warming the air when too cold. The huntſman and whipper-in have each a parlour, kitchen, and ſleeping room. The kennel ſhould be near the houſe, that it may be duly inſpected; as cleanlineſs is no leſs eſſential than food. There ſhould be room for two kennels under the ſame roof, for the convenience of keeping both clean, and for removing the hounds from one to the other, when they are waſhed. Beſides, a ſecond kennel will afford opportunity for drafting the hounds that are intended for hunting the next morning. Hounds will ſoon learn to anſwer to their names, and in drafting them, they may be eaſily counted into the hunting kennel. When the feeder firſt enters the kennel in the morning, he ſhould let the hounds into the outer court; and the lodging room ſhould be then thoroughly cleaned, the windows and doors opened, the litter well ſhaken, and the kennel be made ſweet, before the hounds are again ſhut into it. The lodging room ſhould be bricked, and ſloped on both ſides to the centre, and a gutter ſhould be provided for carrying off the water, ſo that the floor, when waſhed, may be ſoon dried. It ſhould be recollected, that nothing is more hurtful to hounds than damp, or more refreſhing than warmth, after hard work. The kennel ſhould have three doors, two in front and one behind; the latter having a lattice window in it with a wooden ſhutter, which is to be always kept cloſed, except in ſummer, when it ſhould be left open during the whole of the day. The large centre window ſhould have a folding ſhutter, which at night, according to the weather, may be wholly or partially cloſed, and thus the warmth of the kennel may be regulated according to circumſtances, and as it may be judged neceſſary. The two great lodging rooms are exactly ſimilar, and having a court belonging to each, are diſtinct kennels, ſituated at the oppoſite ends of the building; in the centre are the boiling houſe and feeding yard; a leſſer kennel, either for hounds that are drafted off, or thoſe that are ſick and lame, or for any other neceſſary purpoſe, is on each ſide; at the back of which, as it is but half the depth of the two larger kennels, are places for coals, &c. for the uſe of the kennel. There is alſo a ſmall building in the rear for hot bitches. The inner court floors ſhould be bricked or flagged, and ſloped towards the centre, like thoſe of the lodging rooms; and water brought in by a leaden pipe, ſhould run through the channel in the middle. In the centre of each court is a well, large enough to dip a bucket to clean the kennel; to keep theſe from wanting repair, they ſhould be faced with ſtone; to that of the feeding-yard a wooden cover ſhould be fixed. The benches, which muſt be open to let the urine through, ſhould have hinges and hooks in the wall, that they may fold up when the kennel is waſhed: they ſhould be made as low as poſſible, that when a hound is tired, he may have no difficulty in jumping up, and at no time be able to creep under. A large brick court in front, having a graſs court adjoining, and a brook running through the middle of it, completes the kennel. This court ſhould be planted round, and alſo have lime and horſe-cheſnut trees near the centre for ſhade; ſome poſts bound round with ſtraw rubbed with galbanum, may be placed to prevent the hounds urining againſt the trees. The brook may be uſed as a cold bath for hounds lamed in the ſtiſle, and ſtrained. A high pale ſhould incloſe the whole, which, to the height of four feet, ſhould be cloſe, the other open two inches wide. At the back of the kennel ſhould be a thatched houſe, fenced up at the ſides, to contain at leaſt a load of ſtraw ; a pit for receiving the dung, and a gallows for the fleſh. If a piece of ground adjoining the kennel can be incloſed for ſuch dog-horſes as may be brought alive, it will be very ſerviceable, as the diſorders of condemned horſes are not always to be diſcovered, and may be dangerous to others ; the hounds may alſo be brought into this field to employ themſelves after feeding ; and the draft for the next day's hunting can here be more accurately made than when they are confined in the kennel. Stoves are uſed in ſome kennels ; but a good feeder, and the mop properly applied, render them needleſs. Should ticks at any time be troubleſome, the walls of the kennel ſhould be well waſhed ; and if they are not thus deſtroyed, the walls ſhould be white-waſhed. When the hunting ſeaſon is over, one kennel will ſuffice ; the other, with the adjoining graſs-yard, may be allotted to the young hounds. If there be convenience, the dogs ſhould be kept ſeparate from the bitches during the ſummer months. When hounds are very riotous, the feeder may ſleep in a cot in the adjoining kennel, and if they be well chaſtiſed at the firſt quarrel, his voice will be ſufficient afterwards. A feeder in Oxfordſhire pulls a bell, the meaning of which he has taught the hounds to underſtand ; and it ſilences them immediately, without his having the trouble to leave his bed. The farther removed a kennel is from a road or pathway, the quieter will it be. The interior regulations of a kennel comprehend the feeder, the ſorts of food, and the mode of preparing and adapting it to the appetites of the hounds. A good feeder, young, active, induſtrious, and good-tempered, is eſſential. The exquiſite ſenſe of ſmelling peculiar to the hound, being that on which the ſport principally depends, ſhould be carefully preſerved ; and nothing ſo much contributes to this purpoſe as cleanlineſs. It is, therefore, of the greateſt importance that the kennel ſhould be kept clean and ſweet, The heartieſt and beſt food for hounds is oatmeal ; which ſhould be preſerved in binns or ſugar hogſheads ; for the older the meal is the better. The boiler ſhould be of caſt iron ; and in ſize proportioned to the number of hounds in kennel. The fleſh ſhould be thoroughly boiled, and taken out of the broth with the ſtrainer, before the oatmeal is put into it. After about three quarters of an hour's boiling, the liquor may be taken off and left to cool, which will ſoon become a ſtrong jelly, and for hunting hounds it cannot be too compact. Five or ſix pecks of good old oatmeal will thicken a boiler of broth, ſufficient for two feeds for 30 couple of hounds. The meat ſhould never be given to the hounds too hot. The feeding troughs ſhould be wide at bottom and have wooden covers ; nor ſhould they be made too long, as they are leſs convenient for being moved. After all, great attention to the time and mode of feeding will be required on the part of the kennel huntſman. He ſhould be accuſtomed to call each hound by name, when he is fed ; when a hound is called, he ſhould approach the huntſman, and when he is touched with a ſtick, he ſhould follow any where. By thus uſing hounds to their names, they will learn obedience. The day before hunting the hounds ſhould be fed at eight in the morning, and three in the afternoon. Thoſe that are to hunt the next day ſhould be drafted into the feeding-yard, when about three buckets of thick mixed oatmeal is prepared for them ; and the tender and bad feeders ſhould have a handful of boiled fleſh given to them afterwards. If hounds be low in condition, and have far to go to cover, they may all have a little thin lap again in the evening ; but this ſhould never be given, if you hunt early. Hounds ſhould be ſharp ſet before hunting, as in this ſtate they run the better. During the hunting ſeaſon, hounds ſhould have one pound of ſulphur given them in their meat, and when the ſeaſon is over, half a pound of antimony ſhould be added to the ſulphur and well mixed with the meat. Greens boiled in their meat, once a week, are likewiſe proper. A horſe killed and given to hounds whilſt warm, after a very hard day, is an excellent meal ; but they ſhould not hunt till the third day after it. The bones broken are good for poor hounds ; ſheep-trotters are very ſweet food ; and bullocks' paunches may alſo be of ſervice, in the ſcarcity of horſe-fleſh. Immediately when hounds return from hunting, they ſhould be fed ; and if they have had a ſevere day, ſome hours after they ſhould be fed again. By turning them out from the lodging-houſe to be fed, they will be refreſhed, and ſtretch their limbs ; and beſides the litter being ſhaken up, and the kennel cleaned out, they ſettle themſelves better on the benches afterwards. At all times after being fed, the hounds ſhould be turned into the graſs-court to empty themſelves ; as this practice will not a little contribute to the cleanlineſs of the kennel. Hounds ſhould be ſhut up warm at night after hunting. Daniel's Rural Sports, vol. i. See HOUNDS and HUNTING.

KENNERY, in *Geography*, a ſmall iſland near the coaſt of Malabar, ſurrounded with a wall and towers. N. lat. 18° 42′.

KENNET, a river of England, which riſes near a village of the ſame name in Wiltſhire, paſſes by Marlborough, Hungerford, and Newbury, whence it is made navigable to the Thames, which it joins a little below Reading. See CANAL.

KENNET, a townſhip of America, in Cheſter county, Pennſylvania.

KENNETH II., in *Biography*, king of Scotland, ſucceeded his father Alpin in 823. He made war upon the Picts, and ſubdued their dominions in the north, which he divided among his ſoldiers. He tranſlated the ſtone chair to Scone, where his ſucceſſors were crowned, till it was removed by Edward I. He died in the year 854.

KENNETH III., ſon of Malcolm, ſubdued the Britons of Strathcluyd, and was equally ſucceſsful againſt the Danes, who had invaded his dominions, but attempting to alter the ſucceſſion of his crown in favour of his family, he was aſſaſſinated in 994.

KENNETS, in our *Old Writers*, a ſort of coarſe Welſh cloth, mentioned in the ſtat. 33 Hen. VIII. c. 3.

KENNETS, in a *Ship*, are ſmall pieces of timber, nailed to the inſide of the ſhip, into which the tacks and ſheets are belayed (as they call it), *i. e.* faſtened.

KENNETT, WHITE, in *Biography*, a learned Engliſh prelate, ſon of the Rev. Baſil Kennett, rector of Dimchurch, in Kent, was born at Dover in the year 1660. He received the early part of his education in the country, and made ſuch progreſs in claſſical learning, that upon his being removed to Weſtminſter, he was admitted into the upper ſchool. Immediately after his admiſſion he fell ſick of the ſmall-pox, which obliged him to wait another year before he could be received into the ſchool. During this period he undertook the office of tutor to a gentleman's ſon in the neighbourhood. He entered himſelf at Oxford in 1678, and went through the ſtudies and exerciſes of the place with great reputation. While he was an under-graduate, he was introduced to the acquaintance of Anthony Wood, and employed by him in collecting epitaphs, and other notices of eminent men, who had been members of Oxford. Mr. Kennett was particularly attached to the ſeveral branches of polite literature, connected with antiquities and hiſtory. But his career as an author commenced in the publication of a political tract while he was under-graduate, entitled " A Letter from a Student at

Oxford to a Friend in the Country concerning the approaching Parliament, in Vindication of his Majeſty, the Church of England, and the Univerſity." It was written in defence of court meaſures, and ſupported principles which he renounced in his maturer years. The Whig party in parliament were ſo much offended with it, that enquiries were made after the author, in order to get him puniſhed, but the ſudden diſſolution of parliament preſerved him from the effects of their reſentment. Mr. Kennett took his degree of B.A. in 1682, and in the following year he publiſhed an Engliſh tranſlation of Eraſmus's "Moriæ Encomium;" entitled "Wit againſt Wiſdom, or a Panegyric upon Folly." He entered into holy orders about the year 1694, and in the following year he was preſented to the vicarage of Amerſden, in Oxford, by ſir William Glynne, to whom he dedicated "An Addreſs of Thanks to a good Prince, preſented in the Panegyric of Pliny upon Trajan, the beſt of Roman Emperors." Mr. Kennett diſtinguiſhed himſelf by preaching againſt Popery, though he did not engage in the famous Popiſh controverſy. While he was out on a ſhooting party, he received a dangerous wound on his head, which obliged him to undergo the operation of trepanning: he, however, ſoon recovered, and was choſen lecturer at St. Martin's, Oxford: he was likewiſe choſen tutor and vice-principal at Edmund Hall, where he lived in terms of friendſhip with the principal Dr. John Mill, who was at this time employed in preparing for the preſs his celebrated edition of the New Teſtament. In 1693, he obtained the rectory of Shotteſbrook, in Berkſhire, and, in 1695, he commenced D.D., and in the following year was preſented to the living of St. Boltolph, Aldgate, having been already appointed arch-deacon of Lincoln. In 1701 he engaged in a controverſy on the rights of the convocation againſt Dr. Atterbury. In 1705, upon the advancement of Dr. Wake to the ſee of Lincoln, Dr. Kennett was appointed to preach his conſecration ſermon; which was publiſhed at the deſire of the archbiſhops and biſhops, and was greatly admired by lord chief juſtice Holt, who declared that it contained more to the purpoſe of the legal and Chriſtian conſtitution of the church of England than any volume of diſcourſes. In 1707 he was made dean of Peterborough, but he was growing very unpopular on account of his Whig principles and his oppoſition to Dr. Sacheverel: nevertheleſs, in the ſame year, he was allowed to exchange his living in Aldgate for the rectory of St. Mary Aldermary, in order that he might have more leiſure for ſtudy and retirement. The zeal which dean Kennett diſplayed in oppoſition to the claims of the high church clergy, and the ſentiments of moderation which he diſcovered towards the Diſſenters, as well as his attachment to the Proteſtant ſucceſſion, and the intereſts of civil liberty, rendered him very obnoxious to the Tories, who took every method in their power to expoſe him, one of which was deviſed by Dr. Wilton, rector of Whitechapel, who was afterwards deprived of his living as a nonjuror. This clergyman preſenting a new altar-piece, repreſenting the Laſt Supper, to his church, cauſed the figure intended for Judas Iſcariot to be drawn as a likeneſs of the dean of Peterborough, with a black patch on his head, ſimilar to one which Dr. Kennett wore on the wound which he had formerly received. It was ſoon known for whom the caricature was intended, and people came in crowds to ſee it. But by all moderate people of both parties, it was regarded as an inſolent and profane proſtitution of what was intended for the moſt ſacred uſes, and the biſhop of London, without any interference on the part of the dean, ordered it to be taken down. After the acceſſion of king George I., and when a rebellion was breaking out in Scotland, he preached with the utmoſt boldneſs in defence of the preſent ſettlement of the government of the houſe of Hanover: he uſed to ſay, he was ready to live or die in defence of the glorious principles of the Revolution, and that he would go out to fight, when he could no longer preach in defence of them. He warmly oppoſed the proceedings in the convocation againſt Dr. Hoadly, biſhop of Bangor, on whoſe ſide he was deeply engaged in the Bangorian controverſy. His zeal in the cauſe of civil and religious liberty was, in the year 1718, rewarded by the biſhopric of Peterborough, which he enjoyed ten years. He died in 1728, in the ſixty-ninth year of his age. His principal works are, 1. "The Life of William Somner," which was prefixed to Mr. Brome's edition of the famous antiquary's "Treatiſe of the Roman Ports and Forts in Kent." 2. A collection of Engliſh hiſtorians, under the title of "The Complete Hiſtory of England," in three vols. folio, the laſt of which was written by himſelf. 3. "Hiſtorical Account of Appropriations." Biſhop Kennett ſuſtains a conſiderable rank in the epiſcopal order for learning and abilities. He was deeply read in Engliſh hiſtory and antiquities, though he was by no means deficient in that kind of knowledge which was the more immediate buſineſs of his profeſſion. He was anxious to diſcharge the duties of his miniſterial functions with credit to himſelf, and advantage to thoſe who were the immediate ſubjects of his paſtoral care; nor did the high rank to which he attained lead him to neglect the duties of a pariſh-prieſt. He was acceſſible and communicative, a true friend, as well as an admirable pattern to his clergy, and thoſe of them who diſtinguiſhed themſelves either by their learning, or by a zealous diſcharge of their parochial duties, were ſure of his reſpect and encouragement.

Kennett, Basil, younger brother of the above, was born at Poſtling, in Kent, in 1674, and educated at Corpus Chriſti college, Oxford. In 1696, he publiſhed "Romæ Antiquæ Notitia, or the Antiquities of Rome," a work that for a century was generally uſed in our claſſical ſchools. In the following year he gave to the public "The Lives and Characters of the Ancient Greek Poets;" and he was about the ſame time elected a fellow of his college, and entered into orders. He was author likewiſe of "An Expoſition of the Apoſtles' Creed, according to Biſhop Pearſon," and "An Eſſay towards a Paraphraſe on the Pſalms in Verſe, with a Paraphraſe on the third Chapter of Revelations." In 1706, he was appointed chaplain to the Engliſh factory at Leghorn; in this office he conducted himſelf with ſo much prudence and propriety that he acquired univerſal eſteem, even from the Catholics, who had uſed every effort to prevent his officiating in that capacity. In 1714, he returned to England, and commenced D.D., but died in a few months afterwards. A volume of his ſermons, prepared for the preſs during his life, was publiſhed in the year 1715. Biog. Brit.

KENNICOTT, Benjamin, a learned Engliſh divine, and oriental ſcholar, was born at Totneſs, in Devonſhire, in the year 1718. His father was maſter of a charity-ſchool in that place, and the ſon ſucceeded to the employment at a very early age. While in this ſituation his talents were diſcovered, and a ſubſcription entered into, in order to procure him the advantages of an academical education. He accordingly was entered of Wadham college, Oxford, where he ſoon diſtinguiſhed himſelf in that department of ſtudy in which he afterwards became ſo eminent. He commenced his career as an author while he was an under-graduate, by publiſhing two diſſertations: the firſt "On the Tree of Life in Paradiſe, with ſome Obſervations on the Fall of Man;" the ſecond "On the Oblation of Cain and Abel." This work procured the author the extraordinary honour of having the degree of B.A. conferred on him by the univerſity a year before the ſtatutable period ; and likewiſe was the means of obtaining for him a fellowſhip of Exeter college. When he was of a ſufficient ſtanding, he took the degree of M.A. and about the ſame period he was admitted to holy orders. In the year 1753, he laid the foundation of his great work, by publiſhing "The State of the Hebrew Text of the Old Teſtament conſidered ; a Diſſertation in two Parts, &c." The deſign of this publication was to overthrow the ſtrange notion which had long prevailed among divines concerning what is called the integrity of the Hebrew text ; *viz.* that the copies of it had been preſerved abſolutely pure and uncorrupt. This notion had been thrown out and vindicated by Capellus, but though his arguments were ſupported by the authority of the Samaritan Pentateuch, that of parallel paſſages, and the ancient verſions, yet as he had no opportunity of conſulting MSS. he could never prove his point. This taſk was reſerved for Mr. Kennicott. His diſſertation proved that there were many Hebrew MSS. extant, which, though they had hitherto been generally ſuppoſed to agree with each other, and with the printed Hebrew text, yet contained numerous and important various readings, and that from theſe conſiderable authority was derived in ſupport of the ancient verſions. This work was examined with great ſeverity, both at home and abroad : many excellent and learned Chriſtians imagined that it was opening wide a door to infidelity, and that the cauſe of their holy religion would be much injured by it ; but by the generality of learned and candid biblical ſcholars, both natives and foreigners, its value was juſtly appreciated, and they were led to form high expectations of the author's future labours in the ſervice of ſacred criticiſm. Mr. Kennicott ſpent the next three or four years principally in ſearching out and examining Hebrew MSS. In 1759, he was preſented to the vicarage of Culham, in Oxfordſhire, and in the following year he publiſhed his "State of the printed Hebrew Text of the Old Teſtament conſidered." In this volume he vindicated the authority and antiquity of the Samaritan copy of the Pentateuch ;—proved that the preſent Chaldee paraphraſe has not been taken from MSS. ſo very ancient as has been generally ſuppoſed, and that it has been, in ſome caſes wilfully, altered in conformity to the Hebrew text, where that text itſelf had been corrupted ;—appealed to the ſentiments of the Jews themſelves on the ſubject of the Hebrew text, and gave a hiſtory of it from the cloſe of the Hebrew canon, down to the invention of printing, and preſented an account of all the Hebrew MSS. then known, with a collation of eleven Samaritan MSS., and a particular catalogue of 110 Hebrew MSS. in Oxford, Cambridge, and the Britiſh Muſeum. Mr. Kennicott now publiſhed propoſals for collating all the Hebrew MSS. prior to the invention of printing, that could be found in Great Britain and Ireland, and for procuring as many collations of foreign MSS. of note, as the time and money he ſhould receive would permit. In this undertaking he was ſupported with the moſt liberal ſubſcriptions from perſons of all parties, and of the very higheſt ranks in ſociety, and he bent his whole powers to complete the very arduous undertaking. While he was proceeding in the work he was appointed keeper of the Radcliffe library ; admitted to the degree of doctor of divinity ; preſented to a living in Cornwall, and rewarded by a canonry of Chriſt-church, Oxford. In the year 1776, Dr. Kennicott publiſhed the firſt volume of his Hebrew bible, and in the year 1780 the ſecond volume, which completed the deſign, made its appearance. To the whole was prefixed a general diſſertation, giving a full hiſtory of the nature of the deſign, and of the benefits likely to reſult from it. The various readings which are inſerted in it are the reſult of a collation of ſix hundred MSS. Such a work, and ſo important to the beſt intereſts of mankind, reflects very high honour on the country in which it was firſt patronized and carried into execution. Within two years of his death, Dr. Kennicott reſigned his living in Cornwall, from conſcientious motives, on account of his not having a proſpect of ever again being able to viſit his pariſh. No one, however, capable of appreciating the doctor's labours, can doubt that they might properly have entitled him to retain this preferment ; ſtill a conduct, ſo ſignally diſintereſted, deſerves to be recorded and celebrated. He died at Oxford on the 18th of September 1783, at the age of ſixty-five. At the time of his death he was employed in preparing for the preſs "Remarks on ſelect Paſſages in the Old Teſtament," which were publiſhed as a poſthumous work, accompanied by eight ſermons, partly critical and partly practical. In private life, Dr. Kennicott ſuſtained the character of a liberal, worthy, and friendly man ; in company he appeared unaffected, good tempered, and cheerful. Encyc. Brit. Monthly Review, and New Ann. Regiſter. For a particular account of Dr. Kennicott's laudable undertaking, ſee the article *Hebrew* Bibles.

KENNINGTON, in *Geography*, an extenſive and populous hamlet, annexed to the pariſh of Lambeth, Surry, England. The manor formerly belonged to the duchy of Cornwall, and was provided with a palace, which was occaſionally occupied by Edward the Black prince, and Henries IV., VI, and VII. On a common or open piece of ground the convicted felons of Surry were formerly executed : around this ſpot ſeveral rows of houſes and ſtreets have been recently built : and Kennington may now be conſidered as conſtituting a part of the Britiſh metropolis. Lyſons's Environs of London.

KENNIS, in *Biography*, a performer on the violin, with an uncommon power of execution. See Louvain and Carillons.

KENNOMICK, Great, in *Geography*, a navigable river of America, in the N.W. territory, which empties itſelf into the S. end of the lake Michigan, N. lat. 42° 14'. W. long. 86° 52'. The waters of this river communicate, by a portage of 30 yards, with Little Kennomick, a ſhort river which runs north-eaſterly into this lake.

KENPOU, a river of Thibet, which runs into the Sanpoo, in the kingdom of Ava.

KENRICK, William, in *Biography*, the ſon of a citizen of London, was brought up to a mechanical employment, which he ſoon abandoned, and devoted himſelf to the cultivation of letters, by which he ſupported himſelf during the remainder of life. He was ſome time a ſtudent at Leyden, and, upon his return to England, he appeared as a poet, in "Epiſtles Philoſophical and Moral." He wrote an avowed defence of infidelity while in priſon for debt, and with a declaration, that he was leſs ambitious of the character of a poet than of a philoſopher. He was for a conſiderable time a writer in the Monthly Review, but having a diſagreement with Mr. Griffiths he began a new review of his own. He publiſhed, in a few days after the appearance of Dr. Johnſon's edition of Shakſpeare, a review of it, "in which the ignorance or inattention of that editor is expoſed, and the poet defended from the perſecution of his commentators, 1765." In the year 1766, he produced a comedy, entitled "Falſtaff's Wedding," at firſt intended to have been given to the public as an original play of Shakſpeare, retrieved from obſcurity ; and it was admitted to be a tolerably good imitation of the great maſter of drama. Mr. Kenrick was continually involved in diſputes, many of which were not creditable to his character. He tranſlated the Emilius and Eloiſa of Rouſſeau, and Millot's Elements of the Hiſtory of

England. He was likewiſe the author of ſeveral dramatic performances, and other miſcellaneous pieces. He was, in 1774, the editor of "The Poetical Works of Mr. Robert Lloyd," in two vols. 8vo. He died in the month of June 1777. Encyc. Brit.

KENSINGTON, in *Geography*, a pleaſant and populous village in the hundred of Oſſulſton, England, is about one mile and a half W. of Hyde-park Corner, and conſiſted, in 1800, of 1433 houſes, which were occupied by 8556 inhabitants. This place is chiefly noted for its royal palace, which was firſt appropriated to the crown by king William III. who built a houſe here; but that and the gardens have been much altered and improved by ſucceeding monarchs. The gardens are of conſiderable extent, and are laid out in gravel walks, plantations, &c. This is a favourite place of reſort and exerciſe for the inhabitants of London, particularly during the fine weather in ſummer. They are nearly four miles in circumference, and are ſeparated, on the eaſtern ſide, from Hyde-park by a low wall. Through theſe gardens flows a ſmall ſtream, which is made to fill a canal within the incloſure, and another much larger, called the Serpentine river, in Hyde-park. The palace is a large irregular edifice, built at various periods, without harmony of deſign or beauty of architecture. Its ſtate rooms conſiſt of a ſuit of 12 apartments, which contain ſeveral valuable and curious paintings by artiſts of eminence. The names of ſome of theſe are publiſhed in Lyſons's Environs of London; and more fully in "The Ambulator," 12mo. 1810. Beſides ſeveral elegant villas in this pariſh, is a fine ancient manſion called Holland Houſe, the ſeat and property of lord Holland, for a view and account of which, ſee Architectural Antiquities of Great Britain, vol. ii.

Kensington, a townſhip of America, in Rockingham county, New Hampſhire, about ſix miles S. of Exeter, and eight N. of Newbury port. It was incorporated in 1737, and contains 776 inhabitants.

KENT, a maritime county of England, forms the ſouth-eaſtern extremity of this iſland, and is bounded on the weſt by Surry, on the north by the German ocean and the river Thames, which ſeparates it from Eſſex, on the eaſt by the Downs and the ſtraits of Dover, and on the ſouth by Suſſex, and part of the ſame ſtraits. The medium length of the diſtrict, thus encompaſſed, from eaſt to weſt, is 66 miles, and its breadth about 26, whilſt the circumference is nearly 174 miles Its area, according to Boys's Agricultural View, is about 832,000 acres.

Kent is primarily divided into five large diſtricts, called *Laths*, *viz.* Sutton at Hone, Aylesford, Scray, Shipway, and St. Auguſtine. Theſe are ſubdivided into bailiwicks, hundreds, and liberties. The whole county contains fourteen bailiwicks, ſixty-three hundreds, fifteen franchiſes or liberties, the two cities of Canterbury and Rocheſter, and thirty-four market towns, though in ſome of theſe the market is diſcontinued. The number of houſes, according to the returns under the population act of 1800, amounted to 52,998; that of inhabitants to 307,624; of whom 151,374 were males, and 156,250 females. For local purpoſes, the county is nearly equally divided into Eaſt and Weſt Kent, the former contains the laths of Sutton at Hone, Aylesford, and the ſouthern part of Scray; the latter the northern part of the lath of Scray, and thoſe of Shipway and St. Auguſtine. In each of theſe great diſtricts, a court of ſeſſion is held four times every year; twice originally and twice by adjournment: thoſe for the eaſtern diviſion at Canterbury, for the weſtern at Maidſtone. The juſtices, though appointed for the whole county, generally confine their attention to that diſtrict in which they reſide. The county town is Maidſtone, where the aſſizes are held, and the knights of the ſhire are elected. Kent returns eighteen members to parliament; *viz.* two for the county, and two each for Canterbury, Rocheſter, Maidſtone, Queenborough, Dover, Sandwich, Romney, and Hithe. The four laſt are reckoned among the Cinque Ports. The eccleſiaſtical juriſdiction is divided between the archbiſhopric of Canterbury and the biſhopric of Rocheſter; the former having eleven deaneries, containing 281 pariſhes; the latter four deaneries, containing 132 pariſhes.

Ancient Hiſtory.—This diſtrict is peculiarly intereſting to the antiquary, not only from the numerous veſtiges of caſtles, abbeys, and old churches ſtill remaining, but from its proximity to the continent. Many authors contend, that it formerly joined the main land, by means of an iſthmus; and adduce plauſible arguments in ſupport of ſuch hypotheſis. Strabo, Cæſar, Ptolemy, and ſome other ancient writers, call this diſtrict Cantium; which word the Saxons altered to Cant-guar-Cantd. In the Domeſday Survey it is written Chenth. All the tranſactions relating to Cæſar's invaſion of Britain occurred in this county; for on this coaſt he made two deſcents, the 1ſt, fifty-five years before the birth of Chriſt, and the 2d, in the following year. At this time Kent was governed by four Britiſh kings; who collected not only their own ſubjects, but a vaſt concourſe of armed men from the neighbouring ſtates, to oppoſe and repel the invading Romans. Their efforts and bravery were unavailing, and the foreign warriors ultimately compelled the Britons to pay an annual tribute. In the year A.D. 43, a third deſcent was made on this coaſt by Aulus Plautius, who, being afterwards joined by Claudius, effected a conqueſt over the Britons. Kent was now included in that diviſion of Britain called Britannia-Prima; and was governed by Roman laws and Roman officers. Several permanent ſtations and temporary encampments were eſtabliſhed in this county; and military roads were formed. Among the latter was the Watling ſtreet, which extended from Dover, Dubris, to London, Londinium. On its courſe were the other Roman ſtations of Durovernum, at Canterbury, Durolevum, Durobrivis, at Rocheſter, Vagniacæ and Noviomagus. Two other vicinal roads, at leaſt, were formed in this county; one from Durovernum to Regulbium, or Reculver, and the other from the firſt place to Rutupium, or Richborough. Another road, called Stone-way, extended from Canterbury to Limne, the Roman Portus Lemanis.

The firſt deſcent of our Saxon anceſtors was made in this county, A.D. 449, when Hengiſt and Horſa, with about 1500 men, landed at Ebbsfleet, in the Iſle of Thanet. After ſome battles with the Picts and Scots, Hengiſt was inveſted with the ſovereignty of Kent; but wiſhing to engroſs the whole iſland, he was involved in a war with the Britons, and ſeveral battles were fought within this county and on its confines. The Saxons, however, prevailed, and Kent continued a diſtinct kingdom for many reigns. In this county Chriſtianity was firſt eſtabliſhed in Britain. See St. Augustine, and Turner's Hiſtory of the Anglo-Saxons, 2 vols. 4to.

The preſent flouriſhing condition of Kent has partly originated from the peculiar cuſtom by which the deſcent of landed property is here regulated, and which is comprehended under the term *gavel-kind.* The cuſtoms are of very remote date, and prevailed throughout England till the Norman conqueſt. It is evident that at that period the eldeſt ſon did not inherit to the excluſion of his brethren: the right of ſole ſucceſſion, in preference to the diviſible practice of inheritance, was then introduced by the Conqueror, as a ſpecimen of the arbitrary dominion he intended to eſtabliſh. The men of Kent ſucceſsfully reſiſted the incroachment, and retained their ancient cuſtoms: while the other parts of the nation were gradually brought to acquieſce in the claim of primogeniture.

The law of gavel-kind comprehends the joint inheritance of all the ſons to the eſtate of the father; and ſhould the father ſurvive his ſons, the inheritance devolves to his grandſons, or to his daughters. The partibility of this cuſtom is not reſtrained to the direct line of conſanguinity; for all brothers may jointly inherit the eſtate of a deceaſed brother; and, agreeably to the ſame rule, nephews and nieces, by the right of repreſentation, are, in their degrees, intitled to the ſame diviſion of property. So predominant is gavel-kind in Kent, that all lands are preſumed to be ſubject to that uſage, till the contrary is proved; and formerly, ſuch lands only were exempted from it, as were holden by knight's ſervice. See GAVEL-KIND.

The general aſpect of Kent is very beautiful; ariſing from the inequality of the ſurface, the diverſity of the ſcenery, and the variety in the verdure. "The whole county," Mr. Haſted obſerves, "excepting the marſhes and the Weald, is a general cluſter of ſmall hills; two chains of which, higher than the reſt, run through the middle of Kent, from weſt to eaſt, in general at about eight miles diſtance from each other, (though at ſome places much leſs,) and extending from Surrey to the ſea." Theſe are called the Upper and Lower Hills, and are moſtly covered with coppice and woodlands. The northern range, and, indeed the whole north ſide of the county, is compoſed principally of chalk and flints, as well as a large tract on the eaſtern coaſt: the ſouthern range is chiefly of iron-ſtone and rag-ſtone: to the weſtward, clay and gravel prevail on the eminences.

Mr. Boys, in the Agricultural Survey of this county, has divided it into eight diſtricts, according to the nature of the ſoil and produce: theſe reſpectively comprehend the Iſle of Thanet; the upland farms of Eaſt Kent; the rich flat lands in the vicinity of Faverſham, Sandwich, and Deal; the hop-grounds, &c. of Canterbury and Maidſtone; the Iſle of Sheppey; the upland farms of Weſt Kent: the Weald of Kent; and Romney Marſh. The Iſle of Thanet forms the north-eaſtern angle of Kent, from the main land of which it is ſeparated by the river Stour and the water called the Nethergong: its length is about nine miles, and its breadth about five. This diſtrict is in a very high ſtate of cultivation, and of very remarkable fertility; its ſoil, though originally a light mould on a chalky bottom, having been greatly improved by the inexhauſtible ſtore of manure ſupplied by the ſea. The whole iſle contains about 3500 acres of excellent marſh land, and 23,000 acres of arable; thoſe of the latter, which border on the marſhes, are the moſt productive; though even the uplands are rendered extremely fertile by the excellent modes of cultivation. The general routine of crops on the lighter ſoils is fallow, barley, clover, and wheat; but a crop of peas is occaſionally introduced inſtead of the fallow; and ſometimes beans in the place of the clover. Where the round-tilth courſe is purſued in the rich ſandy loam lands, the general routine is beans, wheat, and barley. Canary-ſeeds are likewiſe grown here in great quantities, as well as radiſh, ſpinach, muſtard, cabbage, and other eſculent plants for the London markets. The marſh lands are principally applied to the fattening of ſheep and cattle. The upland farms of Eaſt Kent may be deſcribed as including an open and dry tract of land, lying between the city of Canterbury, and the towns of Dover and Deal; and another tract, incloſed with woods and coppice, extending from Dover, by Elcham and Aſhford, to Rocheſter, in length; and from the iſle of Sheppey to Lenham, &c. in breadth. The former tract includes a great variety of ſoils, ſcarcely thoſe of any two farms being ſimilar. Stiff clays are principally met with on the tops of the higheſt hills about Dover; flinty tracts occur in the vallies in the ſame neighbourhood, and about Stockbury near Maidſtone. The woodlands in Eaſt Kent are diſperſed chiefly between the great road from Rocheſter to Dover, and the chalk hill that runs from Folkſtone, by Charing to Detling. Theſe furniſh the adjacent country with fire-wood, and the dock-yards with timber for ſhip-building; but the moſt material part of their produce, is the immenſe quantity of hop-poles cut out for the neighbouring plantations. The wood is generally cut at from ten to fourteen years growth, and its value is eſtimated by the quantity of hop-poles produced. The rich flat lands in the vicinity of Faverſham, Sandwich, and Deal, lie nearly on a level, are extremely fertile, and excellently managed under a general ſyſtem. They are almoſt entirely arable; the ſoils are a rich ſandy loam, intermixed with ſand, and a ſtiff wet clay. In the vicinity of Sandwich are many orchards, which in ſome years produce large quantities of good apples, the greater part of which is conveyed by the coal veſſels to Sunderland and Newcaſtle. The hop-grounds, extending from Maidſtone and Canterbury to Sandwich, are very productive, and under a good ſyſtem of management; though the ſoils are different, as well as the kind of hops cultivated. The plantations have of late years been greatly increaſed, particularly in thoſe parts contiguous to Maidſtone, Faverſham, and Canterbury; the plantations called the City Grounds, extend through a circuit of two miles and a half round Canterbury, and are eſtimated to include from 2500 to 3000 acres. The hops grown here, and in the grounds running hence to Sandwich, are very rich in quality, and in much requeſt for their great ſtrength; if well managed, they are alſo of a good colour. Thoſe grounds are found moſt productive, which have a deep rich loamy ſurface, with a ſub-ſoil of deep loamy brick earth; and this kind of land forms the principal part of the plantations of Eaſt Kent; though there are ſome good grounds where the ſurface is very flinty. The produce is ſubject to great fluctuation; in ſome years amounting to fourteen or fifteen hundred weight per acre; in others not exceeding two hundred. In drying hops, a ſmall quantity of brimſtone is ſometimes uſed, in order to ſuffocate the inſects, and occaſion a more ſpeedy evaporation of the ſuperfluous moiſture: by the uſe of the ſulphur, the hops are thought alſo to be improved in colour. In the plantations of Maidſtone, and its vicinity, very great crops of hops are grown; but they are inferior in quality to thoſe of Canterbury and Eaſt Kent. The ſoil is what is locally termed ſtone ſhatter; that is, where there is a mixture of ſmall pieces of ſtone and ſand: the ſub-ſoil is called Kentiſh rag, and burns into good lime. The hop plantations afford employment to great numbers of the poorer claſſes, not only of this, but of other counties; and the motley groups that aſſemble to aſſiſt in hop-picking are truly amuſing. Hops are generally regarded as having been introduced into this country about the time of Henry VI.; and in the year 1428, they were petitioned againſt as *wicked weed*. This, however, can only refer to the uſe of them, for they are found wild in almoſt every part of Britain. They came into more general uſe in the reigns of Henry VIII. and Elizabeth. Nearly one-fourth of the whole produce of the hop-duty in England, is paid from the plantations of Eaſt Kent. Beſides the hop-grounds, the neighbourhood of Maidſtone is celebrated for apples, cherries, and filberts; many ſmall fields, of from one to fifteen acres, being planted with different ſpecies of theſe kinds of fruit; it is alſo a common practice to plant hops, apples, cherries, and filberts, all together. The apples intended for cyder, are generally gathered towards the end of October, and after being laid in heaps to ripen, under cover, are manufactured for uſe.

In plentiful years the cyder fruit ſells for fourteen-pence per buſhel. The apples appropriated for domeſtic uſes are ſold to the fruiterers, who ſend them to London by the hoys, or to the north of England by the coal veſſels. The cherries, which are of the white and black heart, Hertfordſhire-black, red, and Flemiſh or Kentiſh kinds, are uſually ſold to higlers, who retail them on the ſea-coaſt by the ſieve or baſket, containing forty-eight pounds each; or elſe they are ſent by water to London, and conſigned to the fruit-factors. The filberts are moſtly diſpoſed of in the ſame manner. The Iſle of Sheppey is ſeparated from the reſt of Kent by an arm of the ſea, called the Swale, which is navigable for veſſels of 200 tons burthen. Its length is about eleven miles, and its breadth eight; four-fifths of it conſiſting of marſh and paſture lands; the remainder is arable. The prevailing ſoil is a deep, ſtrong, ſtiff clay, through which the plough can hardly be forced. The upland farms of Weſt Kent include a great variety of ſoils, and are cultivated under various ſyſtems of huſbandry. This diſtrict is more incloſed than the eaſtern part, and produces greater quantities of timber and underwood, particularly on the upper or weſternmoſt ſide. The waſte and common lands of this diſtrict form an extent of many thouſand acres. The turnpike roads are moſtly in good condition; but the croſs roads of Weſt Kent are frequently impaſſable for carriages. The Weald of Kent is a conſiderable and remarkable tract, ſtretching along the ſouth ſide of the county, from Romney Marſh, to Surry; on the north it is bounded by the range of hills which enter the county near Well-ſtreet, and extends, in nearly a due weſterly direction, to Sutton and Egerton, and thence ſouth-eaſtward to Hythe; on the ſouth it ſtretches to the confines of Suſſex, and includes the Iſle of Oxney. This diſtrict was in ancient times an immenſe wood or foreſt; wholly deſtitute of inhabitants, excepting ſwine and deer. By degrees, however, it became peopled, and is now every where interſperſed with towns and villages; though it ſtill contains ſome extenſive and flouriſhing woodlands. Its preſent name is Saxon, and ſignifies a woody country; but the Britons called it *Coit Andred*, the great chaſe or foreſt. The whole was a demeſne of the Saxon kings; and there are ſtill certain privileges annexed to the poſſeſſion of the lands, which induce the proprietors to contend for being within its limits. "It is ſaid," Mr. Haſted obſerves, "that within the Weald, the proof of woodlands having ever paid tythe, lies on the parſon, to enable him to take tythe of it, contrary to the uſual cuſtom in other places, where the proof of exemption lies on the owner; nor are the lands in it ſubject to the ſtatute of woods; nor has the lord waſte within the Weald; the timber growing thereon belongs to the tenant. This latter cuſtom of excluding the lord from the waſte, is called *land-peerage*." The Weald, when viewed from the adjoining hills, which command the whole extent, exhibits a moſt delightful landſcape, interſperſed with ſmall eminences, highly cultivated, and animated by farm-houſes, ſeats, and villages, promiſcuouſly ſcattered among towering oaks and other trees. Romney Marſh is an extenſive level tract of rich marſh land lying on the ſouthern coaſt, and comprehending, in itſelf, about 23,925 acres; but when deſcribed, as it frequently is, in connection with Walland Marſh, which adjoins it on the ſouth-weſt, and Denge Marſh, which connects with the latter on the ſouth-eaſt, it includes about 43,326 acres; Walland Marſh containing 16,489, and Denge Marſh 2912. The whole level, however, is yet more extenſive; for Guildford Marſh, which adjoins Walland Marſh on the weſt, comprizes 3265 acres; moſt of this latter tract is in Suſſex. The beautiful appearance of theſe levels in the ſummer ſeaſon, when the entire ſurface is clothed with luxuriant verdure, and covered with numerous flocks of ſheep and droves of cattle, cannot fail to excite conſiderable intereſt in every obſerver. The Marſh is defended againſt the violence of the ſea by an immenſe bank of earth, of great ſtrength, called Dimchurch-Wall, which extends above three miles in length. This wall is the ſole barrier that prevents the ſea from overflowing the whole extent of the level; and as it is for the general ſafety, ſo "is it ſupported," ſays Haſted, "as well as the three grand ſluices through it, which are for the general drainage of the marſhes, by ſcots levied over the whole of it; but the interior drainage, which is portioned out into a number of diviſions, called waterings, is provided with ſewers, and maintained at the expence of the reſpective land-holders, by a ſcot raiſed ſeparately on each" in proportion to their own watering. In that portion of the Marſhes within this county, are comprehended the two corporate towns of New Romney and Lydd, and ſixteen other pariſhes. The incloſures are principally formed by ditches and a rail fence. The ſoil of theſe ſpacious levels has been almoſt wholly depoſited by the ſea, and conſiſts principally of a fine, ſoft, rich, loam and clay, with a greater or leſs proportion of ſea-ſand intermixed. The ſub-ſoil conſiſts of alternate layers of ſand and clay, with ſea-beach occaſionally intervening. In many places throughout the Marſh, at the depth of three or four feet, have been frequently dug up oak leaves, acorns, &c. together with large trees lying in different directions; ſome acroſs each other; ſome appearing with the roots to them, as if overturned by a ſtorm, or other convulſion of nature; and others as if cut down with an axe or ſharp inſtrument; the colour being as black, and the wood as hard, as ebony. Theſe marſhes are almoſt entirely appropriated to the grazing and fattening of ſheep and cattle, but chiefly to the former, which are bred and fed here in immenſe quantities; their number, perhaps, exceeding that of any other diſtrict in the kingdom. Romney Marſh has generally been conſidered as unhealthy; and probably this opinion has operated to keep it thinly peopled. Of late, however, its ſanative qualities have been greatly improved; a change attributed to the attention that has been given to keep the ditches free from ſtagnant and putrid water. The extent and rental of farms in Kent are uncommonly various, as muſt be evident when the peculiar cuſtoms of the county are conſidered in connection with the diverſities of the ſoils and ſurface. The number of freeholds in the county is ſtated, by Mr. Haſted, at about 9000; independent of the large eſtates of the churches of Canterbury and Rocheſter, and of various corporate bodies. The copyhold and cuſtomary tenants are very few. The general diſtribution of the freeholds, and their cloſe intermixture with each other, occaſion a very frequent intercourſe between the gentry and the yeomen, and thus generate that equality of ſentiment ſo favourable to the intereſts of individual right.

The manufactures carried on in Kent are various, though not particularly extenſive. The clothing trade, which once gave employment to great numbers of its inhabitants, is now nearly forgotten in the county. At Canterbury, muſlins, brocaded ſilks, and ſtockings, are made; at Deptford and Whitſtable are large copperas works; at Stoner, in the Iſle of Thanet, and likewiſe in the Iſle of Graine, ſalt is manufactured; at Oſpringe is an extenſive manufactory for gunpowder, erected by government; and there is alſo another near Dartford; in the Weald, bordering on Suſſex, are various iron furnaces; and at Dartford and Crayford are mills for the manufacturing of iron; at the latter place alſo, are extenſive works for the printing of calicoes, and ſpacious grounds for the bleaching of linens; at Seven Oaks are large ſilk mills; and at Boxley, near Maidſtone, is the moſt extenſive and curious manufacture of paper, perhaps, in Europe; paper is alſo made in the vicinity of Dartford, and ſome other places. The various dock-yards at Deptford, Woolwich, Chatham, &c. provide employment for numerous artizans in all the different branches of naval affairs; ſhip-building is alſo carried on at other places on the ſea-coaſt.

The religious houſes, or monaſtic eſtabliſhments, in Kent, were formerly very numerous, and their net annual income, at the periods of their diſſolution, amounted to 9000*l.* Among them were two abbies, three priories, and five nunneries, of the Benedictine order; one priory of the Cluniac; one abbey of the Ciſtercian; of ſecular canons, five colleges; of regular canons, four abbies and five priories, one of which was Premonſtratenſian: of friars, there was one priory and one nunnery of Dominicans; two priories of Franciſcans, one priory of Trinitarians, three priories of Carmelites, and four alien priories: there were alſo two commanderies of knights hoſpitallers of St. John of Jeruſalem; and fifteen hoſpitals; beſides various hermitages, chantries, and free chapels.

The number of caſtles that have been erected in Kent is very conſiderable; and many of them yet remain, in different degrees, almoſt perfect. Of theſe, the immenſe fortreſs of Dover is the principal; and this is now garriſoned with a ſtrong force, as are alſo ſeveral others on the ſea-coaſt; but moſt of the caſtles in the interior of the county are diſmantled and mouldering into ruins.

The principal rivers that interſect or bound this county are the Thames, the Medway, the Greater and Leſſer Stoure, the Rother, the Darent, the Cray, and the Ravenſborne. The Thames, the Tameſis of Cæſar, which has a very important influence on the trade and commerce of this county, will be fully deſcribed in its place. (See Thames.) The Medway, which is more peculiarly a Kentiſh river, was called Vaga by the Britons, a name deſcriptive of its very ſinuous courſe and mazy wanderings. The Saxons changed this appellation to Medweg and Medwege, of which the preſent name is a corruption. This river has four principal ſources, of which only one is in this county; two being in Suſſex, and the other in Surry. That branch which enters Kent from Surry, riſes in Blechingley pariſh, and having been joined by ſeveral rills, flows on to Eaton bridge, Hever caſtle, and Penſhurſt, near which it receives one of the branches that riſe in Suſſex, and proceeds to Tunbridge. A little above this town the river ſeparates into ſeveral channels, one of which is navigable and is again joined by the other diviſion about two miles below Tunbridge. At Yalding it receives the united waters of the other two principal branches, and flows in a winding direction to Maidſtone, and gradually augmenting in depth and breadth, purſues its pictureſque courſe to Rocheſter, where the ſcenery is peculiarly beautiful. Proceeding hence towards Sheerneſs, it paſſes Chatham, Upnor Caſtle, and Gillingham Fort, and flows onward to the Thames, which it enters between the Iſles of Graine and Sheppey, having firſt united its waters to thoſe of the Swale. The Medway, with its numerous tributary ſtreams, is calculated to overſpread a ſurface of nearly thirty ſquare miles in the very midſt of Kent. The tide flows almoſt as high as Maidſtone; but at Rocheſter bridge it is exceedingly ſtrong and rapid; and below that, all the way to Sheerneſs, a diſtance of about twenty miles, the bed of the river is ſo deep, and the reaches ſo convenient, that many of the largeſt line of battle ſhips are moored here, when out of commiſſion, as in a wet dock, and ride as ſafely as in any harbour in Great Britain. The Medway was firſt made navigable to Tunbridge about the middle of the laſt century, under the proviſions of an act of parliament paſſed in the year 1740; though an act had been procured for the purpoſe in the reign of Charles II. The Greater Stoure has two principal branches, both of which riſe in this county; the firſt at Well-ſtreet near Lenham; the other among the hills between Liminge and Poſtling. Theſe ſtreams unite near Aſhford; whence the Stoure proceeds to Canterbury, through which it flows in a divided ſtream, and again unites a little below that city. The Leſſer Stoure riſes in the vicinity of Liminge, and directing its courſe northward, has its waters increaſed by ſeveral ſmall rills, and ſometimes by a temporary water called the Nailbourn, which, after continued rains or ſudden thaws, iſſues from ſeveral ſprings and forms a ſtrong current. The Rother, formerly called the Limene, riſes at Gravel-hill, in the pariſh of Rotherfield, in Suſſex, and flowing eaſtward becomes the boundary of this county below Sandhurſt and Newenden. The Darent riſes on the borders of this county and Suſſex, near Weſterham, whence flowing to the north-eaſt, it paſſes on to Riverhead, where it turns to the north, and flows in that direction to South Darent. The Cray, and the Ravenſbourne, are only ſmall ſtreams; the former has its ſource at Newell, in Oppington pariſh, the latter riſes on Keſton Downs, near an ancient Roman encampment. Haſted's Hiſtory and Antiquities of Kent, 12 vols. 8vo. Beauties of England and Wales, vol. vii. 1806.

Kent, a county of America, in Maryland, on the eaſt ſhore of Cheſapeak bay, bounded E. by Newcaſtle, and part of Kent county, Delaware, and W. by Cheſapeak bay: about 32 miles long. and 13 broad; containing 11,771 inhabitants, including 4474 ſlaves. Its chief town is Cheſter.

Kent *County*, in Upper Canada, extends northward to the boundary line of Hudſon's bay, including the whole territory to the weſtward and ſouthward of that line, to the utmoſt extent of the country known by the name of Canada. —Alſo, a county of Rhode iſland, lying S. of Providence county, on the W. ſide of Narraganſet bay; 20 miles long and 10 broad; divided into four townſhips, and containing 8487 inhabitants.—Alſo, the middle one of the three counties of Delaware; 40 miles from N. to S. and 26 from E. to W.; containing 10,544 inhabitants, including 1485 ſlaves. The lands in this county are eſteemed the richeſt in the ſtate. It is well watered by ſeveral ſmall ſtreams that empty themſelves into the Delaware. The chief town is Dover.—Alſo, an iſland in Queen Ann's county, Maryland, and the largeſt in Cheſapeak bay; 12 miles from N. to S. and ſix broad. It has a poſt-office.—Alſo, a townſhip in Litchfield county, Connecticut, bordering on the ſtate of New York, and 8 or 10 miles W. of Litchfield; containing 1607 inhabitants.

KENTAISSE, a ridge of mountains of Thibet, between the heads of the Ganges and the Sanpoo rivers. N. lat. 30° 40′. E. long. 80° 49′.

KENTHI, a town of Poland, in the palatinate of Cracow; 30 miles S.W. of Cracow.

KENTSHIAN, a mountain of Thibet; 3 miles E. of Sarangpour.

KENTUCKY, a crooked river of America, which riſes in the ſtate of the ſame name, and after a general N.W. courſe of 200 miles, falls into the Ohio, N. lat. 38° 35′. W. long. 85° 30′. It is ſometimes called "Cattawa." Its ſource is in the Laurel mountains, and it interlocks with Licking river. Its mouth, which is 250 yards wide, is 77 miles above the Rapids, and 626 below Pittſburg. The river is navigable 130 miles, though its current is rapid, the banks being high and rocky. It is ſaid that black-lead mines have been found on the head waters of this river. Little Kentucky river is 25 yards wide, and 3 miles W. of Kentucky river.

Kentucky, one of the United States of America, bounded N.W. by the river Ohio, W. by Cumberland river, S. by Teneſſee ſtate, E. by Sandy river, and a line drawn due S. from its ſource, till it ſtrikes the northern boundary of Teneſſee. It lies between 36° 30′ and 39° 30′ N. lat., and between 81° and 89° W. long., is about 250 miles long, and 200 broad; and contains 50,000 ſquare miles. It was well known to the Indian traders many years before its ſettlement: a map of it was made from their deſcription in 1752; and it was farther explored in 1754 and 1769. But it was firſt ſettled by Col. Daniel Boon in 1773; erected into an independent ſtate by act of Congreſs, in December 1790; and received into the Union in June 1792. Kentucky, which was originally divided into two counties, Lincoln and Jefferſon, has been ſince ſubdivided into 42, as in the following table.

Counties.	No. of In. in 1800.	No. of Slaves in 1800.	Chief Towns.	No. In.
Fayette	12,233	3,786	Lexington	1,795
Jeſſamine	5,438	1,553	Nicholasville	23

Total 1790	73,677	12,430		
Increaſe in 10 years	147,282	27,913		

In January 1799, the legiſlature paſſed an act, apportioning repreſentation, and diſtributing the ſtate into ſenatorial diſtricts. This act provides, that the houſe of repreſentatives ſhall be compoſed of 62 members, elected from the ſeveral counties, according to the ratio of one for every 500 qualified electors, and that the ſenatorial branch of the legiſlature ſhall conſiſt of 24 members.

The whole extent of the north-weſtern ſide of Kentucky is waſhed by the river Ohio; the principal branches of which, that ſerve to water this fertile tract of country, are Sandy, Licking, Kentucky, Salt, Green, Teneſſee, and Cumberland rivers. Theſe again branch out into rivulets and ſtreams, which, purſuing different directions, ſerve to fertilize the whole country. In the dry ſeaſon, however, many of them diſappear, and the inhabitants are diſtreſſed for want of water. At the bottoms of theſe water-courſes, the lime-ſtone rock, which is common in this country, appears of a greyiſh colour; but where it is expoſed to the air, in its natural ſtate, it appears like brown free-ſtone. On the banks of theſe ſtreams the ſtone has the appearance of fine marble, being of the ſame texture, and found in great plenty. In this country there are five noted ſalt-ſprings or licks, which ſupply abundance of ſalt for uſe and exportation. The whole country lies upon a bed of lime-ſtone, generally about ſix feet below the ſurface, except in the vallies, where the ſoil is much thinner. A tract, about 20 miles wide, along the banks of the Ohio, is hilly, broken land, interſperſed with many fertile ſpots. The reſt of the country is agreeably uneven, formed of gentle aſcents and deſcents. The vallies are commonly narrow, and the ſoil thin and inferior in quality; and that along the aſcending ground is frequently not much better; though it is ſufficiently deep for vegetation, as the ſize of the trees indicates. The ſoil is either black, or tinged with a brighter or deeper vermilion, or is of the colour of dark aſhes. In many places there are appearances of potter's clay, and of coal in abundance. Although this country is generally hilly or mountainous, and in many parts barren, it has various plains and ſtrips of land fit for paſturage and the rearing of cattle; and a project has been accompliſhed of cutting a road through the moſt mountainous part from Kentucky, to paſs by the ſweet ſprings in Virginia, and thence to Wincheſter, by which a ſaving is made of 200 miles in diſtance from the one to the other. This country is well timbered. Of trees of the natural growth of the country we may reckon the elm, the beech, the aſh, the juniper, the ſugar, the coffee, the papaw, the hackberry, and the cucumber. The two laſt are ſoft wood, and bear a fruit of the ſize and ſhape of the cucumber. The coffee tree reſembles the black oak, and bears a pod, that incloſes a ſeed, of which is prepared a liquor not unlike coffee. Beſide theſe there is the honey-locuſt, the black mulberry, and wild cherry, of a large ſize. The buck-eye, an excluſively ſoft wood, is the horſe cheſnut of Europe. The magnolia bears a beautiful bloſſom of a rich and exquiſite fragrance. Such are the variety and beauty of the flowering ſhrubs and plants, which grow ſpontaneouſly in this country, that in the proper ſeaſon the wilderneſs appears in bloſſom. The accounts that have been given of the fertility of the ſoil in this country have, in ſome inſtances, exceeded belief, and probably have been exaggerated. However, it is allowed that ſome parts of Kentucky, particularly the high grounds, are remarkably good. The lands of the firſt rate, it is ſaid, are too rich for wheat, and will produce 50 or 60, and in ſome inſtances, 100 buſhels of good corn *per* acre. In common, the land will yield 30 buſhels of wheat or rye *per* acre. Barley, oats, flax, hemp, and vegetables of all kinds, common in this climate, yield an abundant increaſe. Cotton is ſeldom, and with difficulty brought to perfection. Iriſh potatoes thrive well; but ſweet potatoes are raiſed with difficulty. A ſpecies of rye was found by the firſt ſettlers growing wild in Kentucky, and on the lands near the Ohio. It had a bearded ear like the cultivated rye, the beard ſomewhat longer, and the grain leſs. The ſtaple commodities in this ſtate are wheat and tobacco; but as the circumſtances of diſtance from a market, and the difficulty of navigating the Miſſiſſippi, render them unprofitable to the cultivators, they are turning their attention to the raiſing of hemp, for which the ſoil is well adapted. The rivers abound with fiſh of various ſorts; and as ſwamps are rare in Kentucky, the reptiles which they produce, ſuch as ſnakes and frogs, &c. are not numerous. The honey-bee may be called a domeſtic inſect, as it is ſaid not to be found but in civilized countries. Accordingly, it is a common ſaying among the Indians, when they ſee a ſwarm of bees in the woods, "Well, brothers, it is time for us to decamp, for the white people are coming." The quadrupeds, except the buffalo, are the ſame as in Virginia and the Carolinas. The climate, if we except a few places in the vicinity of ponds and low grounds, is healthy and delightful. Their inhabitants do not experience the extremes of heat and cold. In 1798 the greateſt heat was 89° Fahrenheit. The weather in winter is fluctuating. Snow ſeldom falls deep or lies long. The winter begins about Chriſtmas, and is never longer than three months, commonly two, and is ſo mild that cattle can ſubſiſt without fodder. Fahrenheit's thermometer ſeldom falls below 35° in winter, nor riſes above 80° in ſummer. The approach of the ſeaſons is gradual; the ſummer continuing till the middle of October, the autumn or mild weather till Chriſtmas, and the ſpring appears to produce effect in March, and by the middle of April, the foliage of the foreſts is completely expanded. Kentucky has various minerals. A valuable lead mine has been diſcovered between Cumberland and Green rivers. Marle, chalk, gypſum, and ochres are found in different places. The country affords alſo iron, copper, ſulphur, nitre, copperas, alum, &c. From the caves on Green river earth is collected for ſalt-petre; and many of the inhabitants manufacture their own gun-powder. Iron-works are eſtabliſhed. Paper-mills, oil-mills, fulling-mills, ſaw-mills, and a great number of valuable griſt-mills, are erected. Several valuable tanneries have been eſtabliſhed in different parts of the country. Attempts are made, on a large ſcale, for the culture of vineyards, and the introduction of the cotton manufacture. The ſalt-works are more than ſufficient for the ſupply of all the inhabitants, at a low price. Conſiderable quantities of ſugar are made from the ſugar trees. The amount of exports from this ſtate, in 1801, was 626,673 dollars. Malt liquor, ſpirits diſtilled from corn and rye, and the juice of the ſugar-tree, mixed with water, conſtitute the ordinary beverage of the country. No preference is given to any one religious denomination in this country. The Preſbyterians, Baptiſts, and Methodiſts, are the moſt numerous. Among the natural curioſities of the country may be reckoned the banks of Kentucky and Dick's river. Here may be obſerved 3 or 400 feet of ſolid perpendicular rocks, in ſome parts of the lime-ſtone kind, or in others of fine white marble, curiouſly chequered with ſtrata of aſtoniſhing regularity; ſo that the rivers appear like deep artificial canals. Their high rocky banks are covered with red cedar groves. Caves have alſo been diſcovered in this country, ſeveral miles in length, under a fine lime-ſtone rock, ſupported by curious arches and pillars. Springs that emit ſulphureous matter have been found in ſeveral parts of the country. Near Lexington are found curious ſepulchres, full of human bones.

By the conſtitution of this ſtate, formed and adopted in 1792, the powers of government are divided into three diſtinct departments; legiſlative, executive, and judiciary. The legiſlative is veſted in a general aſſembly, conſiſting of a ſenate and houſe of repreſentatives (ſee the beginning of this article); the ſupreme executive in a governor; the judiciary in the ſupreme court of appeals, and ſuch inferior courts as the legiſlature may eſtabliſh. The repreſentatives are choſen annually by the people; the ſenators and governor are choſen for four years by electors appointed for that purpoſe; the judges are appointed during good behaviour, by the governor, with the advice of the ſenate. The declaration of rights aſſerts the civil equality of all; their right to alter the government at any time; liberty of conſcience; freedom of elections and of the preſs; trial by jury; the ſubordination of the military to the civil power; the rights of criminals to be heard in their own defence; the right of the people to petition for redreſs of grievances, to bear arms, and to emigrate from the ſtate. It prohibits unreaſonable ſearches and ſeizures; exceſſive bail; confinement of debtors, unleſs there be preſumption of fraud; ſuſpenſion of habeas corpus writ, unleſs in rebellion or invaſion; ex poſt facto laws; attainder by the legiſlature; ſtanding armies; titles of nobility, and hereditary diſtinctions. The legiſlature of Virginia, while Kentucky belonged to that ſtate, made proviſion for a college in it, and endowed it with very conſiderable landed funds. There has been ſince eſtabliſhed a college at Lexington, called "Tranſylvania," regularly organized and well endowed, having a fund of 14,000 acres of land. The officers of the univerſity are a preſident and two profeſſors, in the literary departments; three medical profeſſors, in the ſchool of medicine; and a profeſſor of law: a divinity profeſſorſhip has been alſo contemplated. The library, ſupplied chiefly by liberal gentlemen in England, amounts to near 3000 volumes; and the philoſophical apparatus is gradually enlarging. In Lexington there is alſo a circulating library of about 1000 volumes. Schools, in ſeveral towns, are liberally encouraged and ſupported. The diſtance from Philadelphia to Kentucky by land is from 7 to 800 miles; from Baltimore nearly 700; nearly 600 from Alexandria; and upwards of 500 from Richmond. Morſe.

KENTZINGEN, a town of Germany, in the Briſgau, about a mile from the eaſt ſide of the Rhine; 13 miles N.W. of Friburg.

KENYON, Lloyd, in *Biography*, was born at Gredington, in Flintſhire, in the year 1733. He was educated at Ruthin ſchool in Denbighſhire, after which he was articled to Mr. Tomlinſon, an attorney at Nantwich, in Cheſhire. When he had completed his clerkſhip, he entered himſelf a member of the ſociety of Lincoln's Inn, and was called to the bar in 1761. He now began to practiſe as a conveyancer, and ſoon obtained a high reputation as a ſound lawyer, which was the means of introducing him to notice in the chancery court. Still, however, he made no figure at the bar, till the trial of lord George Gordon, in 1780, gave him an opportunity for a full diſplay of his talents; and from this moment he was looked up to with reſpect by his brethren at the bar. In 1782, he was made attorney general, and chief juſtice of Cheſter; and, much about the ſame time, he was returned to parliament for Hindon in Wiltſhire. In 1784, he was appointed to the office of maſter of the Rolls; and on the reſignation of the earl of Manſfield in 1788, he was, by the zealous recommendation of lord Thurlow, raiſed to the office of chief juſtice of the king's bench, and ennobled with the title of baron Kenyon. He died at Bath in April 1802, leaving two ſons, George the preſent lord, and the honourable Thomas Kenyon. Gent. Mag.

KEOGANG, in *Geography*, the moſt weſterly of the branches or mouths of the river Ava, in Pegu, which runs into the ſea near Cape Negrais.

KEOWE, or Keowee, the name given in America to the Savannah river, above its conflux with the Tugulo, the weſt main branch.—Alſo, the ancient name of the populous town and territory of the Cherokee Indians, on the river of that name. The ſoil is fertile, and the adjacent heights might, with little expence, be rendered almoſt impregnable. The fruitful vale of Keowe is ſeven or eight miles in extent, terminated by a high ridge of hills, and opening again to an extent of ten or twelve miles down to Sinica, and in breadth one or two miles. This was once a thickly inhabited ſettlement, well cultivated and planted. To the feeble remains of the once potent Cherokees it now exhibits a different ſpectacle.

KEOZEE, a town of Birmah, on the Irawaddy; 15 miles N.E. of Pagahm. This town is ornamented with ſeveral neat temples.

KEPELDEE, a town of Hindooſtan, in the country of the Nayrs; 30 miles E. of Tellicherry.

KEPHER Kenna, a village of Paleſtine, ſaid to be the ancient "Cana," where our Saviour changed the water into wine.

KEPLER, John, in *Biography*, a celebrated aſtronomer and mathematician, born at Wiel, in the duchy of Wirtemberg, December 27th, 1571, was ſon of Henry Kepler, an officer in the army, who had ſerved his country with diſtinction, but who, by misfortunes, was reduced to low and narrow circumſtances. He gave his ſon the beſt education in his power, though the youth was ſubject to many difficulties, by being ſent to different places, and by being put under different maſters. His genius and avidity for knowledge animated him to ſurmount every obſtacle, and to make a very rapid proficiency. He was ſent to Tubingen to purſue his academic ſtudies, and was admitted to the degree of bachelor in 1588, and to that of maſter of philoſophy in 1591. He applied himſelf to mathematics and theology, and undertook the duties of the miniſtry for a ſhort time. But his inclination being decidedly in favour of mathematics, he reſolved to devote his whole time and ſtrength to the ſcience; and ſo high was his reputation, that in the year 1594 he was invited to Gratz, in Stiria, to fill the mathematical chair in the univerſity of that city. In the year 1596, he married a lady of a noble family; and in two years from this period he was driven from Gratz by perſecution, on account of his religious principles; though he was ſoon recalled by the ſtates of Stiria: but not thinking himſelf ſafe, he accepted a preſſing invitation from Tycho Brahe to ſettle in Bohemia, and removed thither with his family and books in the year 1600. Upon a cloſe intimacy, Kepler was diſſatiſfied with the conduct of Tycho, and complained of his unwillingneſs as well to promote his intereſt, as to communicate to him all his diſcoveries and improvements. Tycho, however, died in 1601; but previouſly to this, he introduced him to the acquaintance of the emperor Rodolph, who gave him a favourable reception, and appointed him his mathematician. This title of mathematician to his imperial majeſty Kepler poſſeſſed during the remainder of his life, not only under the reign of Rodolph, but under his ſucceſſors, Matthias and Ferdinand. Upon the death of Tycho, the emperor Rodolph ordered him to complete the tables begun by that great man, which were to be called the "Rodolphine Tables." Theſe, notwithſtanding the vigour with which he applied himſelf to them, were, owing to unexpected difficulties, not completed and publiſhed till the year 1627. Having completed that work, he obtained the emperor's leave to go and reſide at Sagan, in Sileſia, where he ſuffered much inconvenience from not having his penſion regularly paid him. This circumſtance obliged him to take a journey to Ratiſbon in 1630, to ſolicit for the arrears due. Here he died in November, at the age of 59 years. The account of the labours and diſcoveries of this great man has been given by Mr. Maclaurin, in his work on the "Diſcoveries of Sir Iſaac Newton," and from that we ſhall extract the following ſketch. "To Kepler," ſays he, "we owe the diſcovery of the true figure of the orbits, and the proportions of the motions of the ſolar ſyſtem. This aſtronomer had a particular paſſion for finding analogies and harmonies in nature, after the manner of the Pythagoreans and Platoniſts. Three things, he tells us, he anxiouſly ſought after from his early youth:—Why the planets were ſix in number? Why the dimenſions of their orbits were ſuch as Copernicus had deſcribed from obſervations? And, what was the analogy or law of their revolutions? He ſought for the reaſons of the firſt two of theſe in the properties of numbers and plane figures, without ſucceſs. But at length reflecting that while the plane regular figures may be infinite in number, the regular ſolids are only five, he imagined that certain myſteries in nature might correſpond with this limitation inherent in the eſſences of things: he therefore endeavoured to find ſome relation between the dimenſions of thoſe ſolids and the intervals of the planetary ſpheres; and imagining that a cube inſcribed in the ſphere of Saturn would touch by its ſix planes the ſphere of Jupiter, and that the other four regular ſolids in like manner fitted the intervals that are between the ſpheres of the other planets; he became perſuaded that this was the true reaſon why the primary planets were preciſely ſix in number, and that the author of the world had determined their diſtances from the ſun, the centre of the ſyſtem, from a regard to this analogy. Being thus, as he imagined, poſſeſſed of the grand ſecret of the Pythagoreans, and pleaſed with the diſcovery, he publiſhed it in 1596, under the title of "Myſterium Coſmographicum." He ſent a copy of this book to Tycho Brahe, who did not approve of the ſpeculations contained in it, but wrote to Kepler, urging him firſt to lay a ſolid foundation in obſervations, and then, by aſcending from them, to ſtrive to come at the cauſes of things: and to this advice we are indebted for the more ſolid diſcoveries of Kepler. This great man, ſoon after the death of Tycho, found that aſtronomers had erred from the firſt riſe of the ſcience, in aſcribing always circular orbits and uniform motions to the planets; and he diſcovered that each of them moves in an ellipſis, which has one of its foci in the centre of the ſun; that the motion of each is really unequable, and varies in ſuch a manner, that "a ray ſuppoſed to be always drawn from the planet to the ſun deſcribes equal areas in equal times." It was ſome years later before he diſcovered the analogy that there is between the diſtances of the ſeveral planets from the ſun, and the periods in which they complete their revolutions. He has, however, left it upon record, that on the 15th of May, 1618, he found that "the ſquares of the periodic times are always in the ſame propertion as the cubes of the mean diſtances from the ſun." When Kepler ſaw, according to better obſervations, that his diſpoſition of the five regular ſolids among the planetary ſpheres was not agreeable to the intervals between their orbits, he endeavoured to diſcover other ſchemes of harmony. For this purpoſe, he compared the motions of the ſame planet at its greateſt and leaſt diſtances, and of the different planets in their different orbits, as they would appear viewed from the ſun; and here he fancied that he had found a ſimilitude to the diviſions of the octave in muſic.

Of theſe notions, which are wholly unfounded in nature, he was ſo fond, that hearing of the diſcovery of the four ſatellites of Jupiter by Galileo, he owns that his firſt reflections were from a concern how he could ſave his favourite ſcheme, which was threatened by this addition to the number of the planets. The ſame attachment led him into a wrong judgment concerning the ſphere of the fixed ſtars: for being obliged, by his doctrine, to allow a vaſt ſuperiority to the ſun in the univerſe, he reſtrains the fixed ſtars within very narrow limits; nor did he conſider them as ſuns placed in the centres of their ſeveral ſyſtems, having planets revolving round them. Kepler's great ſagacity, and continued meditations on the planetary motions, ſuggeſted to him ſome views of the true principles from which theſe motions flow. He ſpeaks of gravity as of a power that was mutual between bodies; and ſays, that the earth and moon tend towards each other, and would meet in a point, ſo many times nearer to the earth than to the moon, as the earth is greater than the moon, if their motions did not hinder it. He adds alſo, that the tides ariſe from the gravity of the waters towards the moon. But not having notions ſufficiently juſt of the laws of motion, he was unable to make the beſt uſe of theſe ideas; nor did he ſteadily adhere to them, for in his "Epitome of Aſtronomy," publiſhed many years after, he propoſes a phyſical account of the planetary motions derived from different principles. Kepler was author of ſeveral pieces beſides thoſe already mentioned, of which the following may be noticed: "Prodromus Diſſertationum Coſmographicarum;" "De Stella nova in Pede Serpentarii;" "Aſtronomia nova, ſeu Phyſica Cœleſtis, Tradita Commentariis de Motibus Stellæ Martis ex Obſervationibus Tychonis Brahei;" "De Cometis libri tres."

This great geometrician and aſtronomer, in his "Harmonices Mundi," publiſhed at Lintz, in Auſtria, in 1619, and dedicated to our James I., ſpeaks on the ſubject of muſic like a man who had not only thought of it as a ſcience ſubſervient to the laws of calculation, but in the language of one who had ſtudied it practically as an elegant art, and been truly ſenſible of its powers. And though the eloquent aſtronomical hiſtorian Bailly ſays, in a ſweeping deciſion, that "Kepler, from his veneration for Pythagoras and Plato, has plunged into muſical ratios, and blended them with the movements, diſtances, and eccentricities, of the planets, in his viſionary analogies; they contain not one ſingle true ratio or reſemblance: in a crowd of ideas there is not one ſingle truth." This ſevere cenſure of M. Bailly muſt be confined to the proportions and analogies between muſical intervals and the diſtances of the heavenly bodies: as the ratios of Kepler are accurate, as far as concerns muſic.

Neither Maclaurin nor Dr. Hutton have expreſſed themſelves ſo harſhly on his fancied ſimilitudes to the diviſions of the octave in muſic; which they indeed call the dreams of this ingenious man, as the harmony of the ſpheres had been of Pythagoras and Plato long before.

This great mathematician and precurſor of ſir Iſaac Newton was ſo far from allowing to the ancients, much as he reſpected them, ſuch harmony as is practiſed by the moderns, that he ſays, though Plato, in his "Republic," ſpeaks as if ſomething like it were in uſe, he ſuppoſes if they ever had any accompaniment to their melodies by way of baſe, it muſt have been ſuch a one as is produced by the drone of a bagpipe. This is perhaps being as unjuſt to the ancients, as thoſe are to the moderns, who will not allow them to have made any progreſs in muſic, becauſe they are unable, by their compoſitions and performance, to cure diſeaſes, tame wild beaſts, or build towns.

KEPLER's *Laws*, is a term uſed by aſtronomers to denote certain analogies between the diſtances of the planetary bodies from the ſun, and their times of periodic revolution; as alſo between the rate of motion in any revolving body, whether primary or ſecondary, and its diſtance from the central body about which it revolves. The latter of theſe, which is generally called Kepler's firſt law, being that which he firſt diſcovered, is commonly expreſſed as follows, *viz.*

1. Equal areas are deſcribed in equal times; that is, if a line be ſuppoſed to join the central and revolving body, this line always paſſes over, or deſcribes equal areas in equal times, whether the planet be in its aphelion, perihelion, or in any other part of its orbit.

2. The ſquares of the times of revolution of the planetary bodies are as the cubes of their reſpective diſtances from the ſun.

Theſe laws were firſt diſcovered by Kepler, the celebrated aſtronomer, whoſe name they bear;—a name which will be perpetuated as long as the ſcience of aſtronomy itſelf is known, and the ſublimity of its laws have charms to captivate the minds of philoſophers. The diſcovery of theſe analogies forms a moſt important epoch in the hiſtory of aſtronomy, as they may be conſidered as having paved the way to that ſublime and univerſal ſyſtem of attraction, the diſcovery of which has immortalized the name of Newton: for Kepler having deduced them from the compariſon of actual obſervations, and therefore independent of any theory, they formed a very uſeful criterion for the corroboration of any particular hypotheſis, as well as an important datum in the inveſtigation of new theories.

In order to form a proper eſtimate of the value of theſe improvements, and the difficulty their author had to encounter in eſtabliſhing them, we muſt look to the ſtate of aſtronomy at that period. Copernicus had juſt revived the Pythagorean ſyſtem, and Kepler was one of its ableſt advocates: but ſtill it was held as a ſacred principle, that the motions of all the planetary bodies were performed in uniform circular orbits; to reconcile which to actual appearances, many ingenious contrivances were made uſe of, and which, it muſt be allowed, repreſented the planetary motion with conſiderable exactneſs.

The angular motion of each of the planets conſiſts of two parts: one part increaſing uniformly with the time; and another which is periodical, and acquires all degrees of magnitude within a certain limit, in the ſeveral parts of the orbit. Now every ſuch motion was accounted for with a tolerable degree of accuracy, by the ancient contrivances of epicycles and deferents. Accordingly the ancient ſyſtems repreſented, with conſiderable exactneſs, thoſe obſerved places of the planets that depended only on the real angular motions; as at the oppoſitions. But they failed when applied to the other poſitions of the planets, and to the latitudes, where the apparent places depend not only on the angular motions, but likewiſe on the relative diſtances. It was here that all the ancient ſyſtems were alike defective; and it was by a ſtrict compariſon of obſervation with theory, that Kepler at laſt found himſelf obliged to depart from that principle of uniform circular motion, which had been ſo ſcrupulouſly adhered to by all his predeceſſors.

The ſituation of the heavenly bodies, in reſpect to one another, depends upon their real angular motions, and their relative diſtances. But when a planet is in oppoſition, the apparent places, as ſeen from the earth and ſun, are coincident, and its poſition is effected only by the angular motions; and, therefore, obſervations in oppoſition, being the ſimpleſt and the leaſt liable to inaccuracy, are of great uſe in aſtronomy. But in obſerving oppoſitions, a practice had been introduced, that in part defeated the purpoſe for which ſuch obſervations had been preferred to all others. A planet was reckoned to be in oppoſition, when its place in the heavens was removed 180° in longitude, not from the real place of the ſun, but from his mean place. It is evident, therefore, that by this practice the obſerver was not ſituated in the ſame line with the ſun and the planet, at the computed time of oppoſition; and, therefore, the apparent place of the planet was not entirely diveſted of the ſecond inequality, excepting in the rare caſe when the true place of the ſun coincided with his mean place. To this practice Kepler objected, and conceived the deſign of determining the orbit of Mars from real, inſtead of apparent oppoſitions; and he entertained the moſt ſanguine expectations of completely reforming the theory of the planets, by his projected innovation. Kepler's intended ſubſtitution of real for mean oppoſitions led him to examine the practice of aſtronomers in another important point. It very ſeldom happens that a planet is found in the plane of the ecliptic, in which the motion of the ſun is performed; and in order to aſcertain the place of the planet in its orbit at the time of obſervation, a reduction from the ecliptic to the plane of the orbit becomes neceſſary: and in examining the ancient methods of reduction, Kepler found them to be erroneous and inconſiſtent; and his inveſtigation ultimately eſtabliſhed this important concluſion, "that the orbits of the planets are invariable planes, interſecting each other in lines paſſing through the ſun's centre." This was a moſt important improvement, and of greater conſequence in ſimplifying the ſcience of aſtronomy than any that had been introduced in all the preceding ages; and his ſucceſsful and deciſive eſtabliſhment of its truth may be juſtly ranked among his greateſt diſcoveries.

Kepler having overcome all the difficulties that oppoſed his projected innovation, at length completed a theory of Mars, derived ſolely from apparent oppoſitions; and its accuracy was unqueſtionable in repreſenting the oppoſitions; but it totally failed when applied to the latitudes, and to the longitudes out of oppoſition. Diſappointed in the high expectation he had formed of his new theory, he yet drew from its failure an important inference, the firſt ſtep to emancipation from the ancient prejudice of uniform circular motion. For as the theory involved only two ſuppoſitions, *viz.* that the orbit of Mars was a circle, and that the motion of the planet was uniform about a fixed point in the line of apſides, he juſtly concluded that one at leaſt of theſe two ſuppoſitions was falſe. He now prepared for further reſearches; but, firſt of all, judged it neceſſary to examine the circumſtance that affected the theory of the earth's annual motion: for as the latitudes of the planets, and the longitudes out of oppoſition, (the phenomena which had hitherto rendered his attempts abortive,) depended on the diſtances of the earth from the ſun, it was requiſite to be aſſured that no errors crept in from this quarter.

Nor was Kepler without ſuſpicions of inaccuracy in the terreſtrial orbit. He had early remarked it as an anomaly, that an equant was aſſigned to all the planets, the Earth or Sun excepted; and although the authority of all aſtonomers was againſt him, he even then preſumed to doubt of the juſtneſs of the exception. Reſuming the examination of this point on the preſent occaſion, he eſtabliſhed, by multiplied and undeniable proof, that the eccentricity was biſected in the orbit of the Earth or Sun, as well as in the orbits of the other planets. Kepler, in turning his attention to the ſolar theory, had alſo a farther improvement in view, *viz.* a method for deriving the equations of the planetary orbits from a leſs arbitrary and precarious principle than that of the equant, or a centre of uniform angular motion. He had remarked, that it is a general fact in the ſolar ſyſtem, that the velocity of a planet diminiſhes as it recedes from the Sun, and increaſes as it approaches that luminary; and he concluded, that theſe two quantities, the velocity of a planet, and its diſtance from the Sun, muſt be related according to ſome law, which, if diſcovered, would enable aſtronomers to calculate the rate of a planet's motion for all points of its orbit, and, of courſe, to determine the equation, or correction due to the mean motion in every ſuch point. This was undoubtedly the concluſion of a man of genius and originality; for though we are now familiar with the notion, that whenever the variations of one quantity depend on thoſe of another, the one of the quantities may be expreſſed by ſome functions of the other; yet, in the days of Kepler, it muſt have required no ſmall effort of generalization to perceive this truth, and the important conſequences which reſult from it. Great difficulties, however, ſtood in the way of the inveſtigation; and Kepler had to ſtruggle, not only with his own precipitancy, which frequently led him into error, but with the imperfections of the geometry of that age, which were great in all matters connected with the quadrature of curves.

His ingenuity and perſeverance, however, at laſt prevailed. He found that the times of deſcribing ſmall arcs of the Earth's orbit, are as the diſtances from the Sun; that therefore the times of deſcribing any arcs whatever, muſt be as the ſums of thoſe diſtances; and having ſatisfied himſelf, from geometrical conſiderations, that the ſum of the diſtances may be expounded (at leaſt nearly) by the area contained between the arc and the radii drawn from its extremity to the centre, he inferred that the times of deſcribing any arcs whatever, are proportional to theſe areas, or which is the ſame, *That equal areas are deſcribed in equal times.* In conſequence of this improvement, Kepler began to ſpeculate on the nature of the force which produced ſo curious an adjuſtment; but the honour of this diſcovery was reſerved for the genius of the immortal Newton. When he again reſumed the conſideration of the orbit of Mars, he ſoon ſaw reaſon to conclude that this body deſcribed its orbit under the guidance of the ſame law that he had juſt found to hold on the Earth; *viz.* that the areas deſcribed by a line drawn from the planet to the Sun, are every where proportional to the time of deſcription.

The attempt, however, of computing the equation of Mars's motion on this principle, was attended with much difficulty, on account of the great eccentricity of the orbit, but ſtill more from that prejudice in favour of the old doctrine of circular orbits, which has been already mentioned. In his new method of computing the equations, Kepler ſuppoſed the orbit to be accurate; but the reſults, from the combination of the two principles, were ſuch as could not be reconciled with the places of Mars, obſerved by Tycho Brahe. In this dilemma, finding that he muſt give up one of the principles which he had adopted in his calculation, he firſt propoſed to ſacrifice his own theory to the authority of the old ſyſtem; thus giving one of the moſt memorable examples which has ever occurred, of the influence of candour and prejudice at the ſame moment. He ſoon found, however, that this ſacrifice would not anſwer his purpoſe, and that, in order to make the calculus agree with obſervations, it was the old hypotheſis, and not the new one, that muſt be abandoned.

Thus the idol was overthrown by which Kepler had been ſo long deceived, and the emancipation of aſtronomy was achieved; but many difficulties were yet to be overcome, before the empire of truth could be firmly eſtabliſhed.

It was proved, that the orbit of Mars was not circular, but its real form was yet undiſcovered. The hypotheſis which firſt preſented itſelf was, that this orbit is an oval or ellipſis, coinciding with the ſuppoſed circular orbit at the two apſides, but falling very much within it in the middle between them; and Kepler having aſſigned the proportions of the longer and ſhorter axes of the curve, according to views that he thought ſound; but which proved to be extremely fallacious, proceeded to deſcribe the ellipſis, to obtain its quadrature, to cut its area in any given proportion, and to derive from thence the equations of the mean motion; all which was accompanied with ſuch labour as nothing but his fortitude and perſeverance would have been able to overcome. He compared the diſtances of Mars, thus computed for no leſs than forty different arcs of anomaly, with the ſame as deduced from obſervation, and had the mortification to find, that they did by no means agree, but that the real places of the planet fell as far without the new oval, as within the old circular orbit. After trying many different means of correcting theſe errors with incredible labour, and always ſubjecting each hypotheſis to the ſevereſt teſt, he found, at length, that an ellipſe, with the ſun in one of its foci, and its greater axis equal to the mean diſtance of Mars, repreſented the whole motion of the planet with wonderful exactneſs. *The planets, therefore, deſcribe ellipſes, having the ſun in their common focus;* and this is the ſecond great diſcovery which delighted the mind, and has immortalized the name of Kepler.

His third diſcovery was that of a law of no leſs importance than either, the deſcription of equal areas, or the elliptic orbits of the planets; but it was made more eaſily than them, and without the ſame elaborate deductions. His ſtrong propenſity to trace out laws and diſcover analogies in nature, ſet him eagerly at work to find out what relation ſubſiſts between the diſtances of the planets from the ſun, and the times of their revolutions round him. The data here lay in a much ſmaller compaſs, and were much leſs various than in the two former reſearches; and Kepler, after making ſome fanciful compariſons between the diſtances of the planets, and the regular ſolids in geometry, and alſo between the ſame and the diviſions of the monochord, thought at laſt of comparing the different powers of theſe quantities with one another, from which compariſon, though not without ſome abortive attempts, this truth at laſt emerged, *that the ſquares of the periodic times of the planets, are as the cubes of their mean diſtances from the ſun.* He expreſſed, in ſtrong terms, the delight and aſtoniſhment he felt on the diſcovery of this ſimple and beautiful analogy. He has carefully marked the day on which the diſcovery was made, (8th May, 1618,) "and few," ſays a writer on this ſubject, "are the days in the hiſtory of the world that deſerve ſo well to be remembered."

After the happy idea of comparing the powers of the diſtances and times, the ſtep to the final reſult was extremely ſimple and eaſy; though it does not appear that Kepler employed any particular method for this purpoſe, but had recourſe to various trials before the real law was diſcovered.

Suppoſe, for inſtance, D, d, and δ, to repreſent the diſtances of any three planets, and T, t, τ, the three correſponding times of periodic revolution; then, in order to aſcertain whether any law ſubſiſts between theſe two ſeries of quantities, let us aſſume the following proportions: *viz.*

$$D^m : d^m :: T^n : t^n$$
$$D^m : \delta^m :: T^n : \tau^n$$

where m and n may repreſent any numbers whatever, either integral or fractional. Then

$$m \log. D + n \log. t = m \log. d + n \log. T$$
$$m \log. D + n \log. \tau = m \log. \delta + n \log. T$$

$$m (\log. D - \log. d) = n (\log. T - \log. t)$$
$$m (\log. D - \log. \delta) = n (\log. T - \log. \tau)$$

or
$$m \log. \frac{D}{d} = n \log. \frac{T}{t}$$
$$m \log. \frac{D}{\delta} = n \log. \frac{T}{\tau}$$

Whence again,

$$\log. \frac{D}{d} \times \log. \frac{T}{\tau} = \log. \frac{D}{\delta} \times \log. \frac{T}{t}.$$

which equality muſt neceſſarily obtain if any law ſubſiſt, and it is remarkable that it ſhould be totally independent of the law itſelf. Therefore, it was only neceſſary to ſubmit the above equality to examination, in order to be aſſured of the exiſtence or non-exiſtence of any analogy; and having thus aſcertained that ſome law muſt have place, the law itſelf is readily diſcovered from any of the above equations. Thus the equation $m \log. \frac{D}{d} = n \log. \frac{T}{t}$ gives immediately $\frac{n}{m} = \frac{\log. \frac{D}{d}}{\log. \frac{T}{t}}$, which fraction being reduced to the loweſt terms will furniſh the particular values of m and n. As theſe formulæ are applicable to any two ſeries of quantities, between which any law of this kind is ſuſpected to obtain, they are not altogether unworthy of attention. We have thus given a ſlight ſketch of the diſcoveries of this celebrated aſtronomer, which, had the limits of our article admitted of it, might have been extended to a much greater length; in the preſent inſtance, however, we can only refer the reader who wiſhes for more complete information on this intereſting ſubject, to Dr. Small's "Account of the Aſtronomical Diſcoveries of Kepler."

KEPLER'S *Problem.* See PROBLEM.

KEPPEL, AUGUSTUS, in *Biography*, a celebrated Engliſh admiral, the ſecond ſon of William, earl of Albemarle, was born April 2d, 1725. He entered the ſea-ſervice while he was young, accompanied commodore Anſon round the world, and by the zeal which he manifeſted in his profeſſion, was raiſed to the firſt honours which it had to beſtow. The moſt important occurrence in his life took place in 1778, when he had the command of the channel fleet, to which he had been appointed at the perſonal and urgent ſolicitation of the king, and which he readily accepted, though he could not help obſerving, that "his forty years ſervices were not marked by any favour from the crown, except that of its confidence in the time of danger." On the 12th of July he fell in with the French fleet, under count d'Orvilliers, off Uſhant: an engagement enſued, which, though partial, was very warm while it laſted. It was neceſſary to take a ſhort time to repair the damages: which being done, the admiral made proper ſignals for the van and rear diviſion to take their reſpective ſtations. This order was obeyed with great alacrity by ſir Robert Harland of the van, but admiral ſir Hugh Palliſer of the rear took no notice of the ſignal, and refuſed to join his commander, till night prevented a renewal of the battle. The French, taking advantage of the darkneſs, eſcaped to their own coaſt. Admiral Keppel, willing to excuſe ſir Hugh Palliſer, at leaſt to ſcreen him from public reſentment, wrote home ſuch a letter as ſeemed even to imply great impropriety of behaviour in the commander himſelf. The conduct, however, of the rear-admiral was attacked in the public papers: he demanded of his commander a formal diſavowal of the charges brought againſt him, which Keppel indignantly refuſed. He immediately exhibited articles of accuſation againſt the commander-in-chief, for miſconduct and neglect of duty, although he had a ſecond time failed with him, and had never uttered a ſyllable to his prejudice. The lords of the admiralty, to the aſtoniſhment of the nation, inſtantly fixed a day for the trial of admiral Keppel: he was moſt honourably acquitted, and received the thanks of both houſes of parliament for his ſervices. Palliſer was next tried, and eſcaped with a cenſure only, but the reſentment of the public was ſo great, that he was obliged to reſign ſeveral offices which he held under government, and to vacate his ſeat in parliament. The acquittal of Keppel was celebrated with the moſt magnificent illuminations, and other marks of rejoicing which had never been known at that time in this country, and the houſes of lord Sandwich, firſt lord of the admiralty, and ſir Hugh Palliſer, were with difficulty ſaved from deſtruction; the windows and much of the furniture being demoliſhed by the fury of the populace. In 1782, admiral Keppel was raiſed to a peerage, with the titles of viſcount Keppel, baron Elden: he was afterwards, at two different periods, appointed firſt lord of the admiralty. He died Oct. 3d, 1786, unmarried, and of courſe his titles became extinct. He was a thorough ſeaman, and a man of great integrity and humanity. Gent. Mag.

Keppel's *Bay*, in *Geography*, a bay of the South Pacific ocean, on the N.E. coaſt of New Holland. S. lat. 23° 28'. E. long. 150° 33'.

Keppel's *Iſland*, or *Traitor's Iſland*, an iſland in the South Pacific ocean. S. lat. 15° 53'. W. long. 172° 33' to 175° 13'.—Alſo, a ſmall iſland on the N. ſide of the moſt weſterly of the Falkland iſlands, in the S. Atlantic ocean. S. lat. 51° 24'. W. long. 60° 15'.—Alſo, one of thoſe called queen Charlotte's iſlands, in the S. Pacific ocean. S. lat. 10° 15'. W. long. 134° 56'.

Keppel's *Iſlands*, a group of iſlands near Keppel's bay, on the N.E. coaſt of New Holland, diſcovered by captain Cook in the year 1770. Near theſe iſlands the water, which was too ſhallow for fiſh, abounded with crabs, which were of two ſorts, and both ſuch as had not been ſeen before: one of them was adorned with the fineſt blue that can be imagined, in every reſpect equal to the ultramarine, with which all his claws and every joint were deeply tinged; the under part of it was white, and ſo exquiſitely poliſhed, that in colour and brightneſs it reſembles the white of old China; the other was alſo marked with the ultramarine upon his joints and toes, but ſomewhat more ſparingly, and his back was marked with three brown ſpots, which had a ſingular appearance. S. lat. 25° 8'. W. long. 209° 1'. Hawkeſworth's Voyages of Cook, &c. vol. iii.

KEPSE, a town of Syria, on the coaſt of the Mediterranean, and on the N. ſide of the mouth of the Orontes, about a mile from the ſea; ſituated, as it is ſuppoſed, on the ſcite of the ancient *Seleucia*, which ſee.

KEPTA, a town of Bootan; 24 miles S. of Taſſaſudon.

KERAMIANS, a heretical ſect of Mahometans, the followers of Mohammed Ebn Kerâm, called alſo Mojaſſemians, or Corporealiſts, who not only admitted a reſemblance between God and created beings, but declared God to be corporeal. They were led to this notion by the literal acceptation of thoſe paſſages in the Koran, which figuratively attribute corporeal actions to God, and of the words of Mahomet, when he ſaid, that God created man *in his own image*, and that himſelf had *felt the fingers of God*, which he laid on his back, to be *cold*.

KERAMO, in *Geography*, a town of Aſiatic Turkey, in Natolia; 24 miles S.S.E. of Milets.

KERANA, a long ſort of trumpet: ſomewhat in form of a ſpeaking-trumpet, uſed by the Perſians.

To the ſound of this, they add a confuſed noiſe of hautboys, timbrels, drums, and other inſtruments, every evening at ſun-ſet, and two hours after midnight.

KERATI, in *Geography*, a town of Aſiatic Turkey, in Caramania; 26 miles N.W. of Beiſhebri.

KERATIA, a town of European Turkey, in Livadia; 24 miles S.S.E. of Athens.

KERATOPHYTUM, in *Natural Hiſtory*, a ſpecies of *Gorgonia*; which ſee.

KERAUN, in *Geography*, a town of Hindooſtan, in Lahore; 15 miles W.N.W. of Gujurat.

KERBEH, a town of Natolia; 44 miles N.E. of Iſmid.

KERBOOZA. a town of Hindooſtan, in Lahore; 32 miles S.E. of Attock.

KERCAL, a town of Africa, in Fez, on the coaſt of the Mediterranean; 45 miles E.S.E. of Tetuan.

KERCH, or Kertsch, a fortified town of Ruſſia, in the province of Tauris, on the channel between the Black ſea and the ſea of Azoph. It was founded by a colony of Greeks from Miletus, and afterwards ſubdued by the kings of Boſphorus. In the year of Rome 689, it was taken by Mithridates, king of Pontus, who, in conſequence of the rebellion of his ſon Pharnaces, was beſieged in the caſtle, and at his own requeſt put to death by an officer of the Gauls, who had forced the walls; 100 miles E.S.E. of Perekop. N. lat. 45° 16'. E. long. 36° 14'.

KERCHA, a town of Perſia, in Chuſiſtan; 30 miles N.W. of Suſter.

KERCKRING, Theodore, in *Biography*, a celebrated phyſician, was a native of Amſterdam. He had attained the age of eighteen, when he began the ſtudy of the Latin language, under the tuition of Francis Van Ende, and ſoon afterwards applied himſelf to medicine with ſo much zeal and ſucceſs, that he obtained a high reputation, both in the practice of the profeſſion, and by his anatomical and chemical diſcoveries. He continued the exerciſe of his art at Amſterdam for ſeveral years, and married the daughter of his preceptor, before mentioned; after which he ſettled at Hamburgh in the year 1678, where, after having for a long time held the appointment of reſident from the grand duke of Tuſcany, he died in November, 1693. Anatomy was the favourite ſubject of his reſearches, and he formed an anatomical muſeum, which was long an object of admiration, and the reſort of the curious, who viſited that city. His principal writings were likewiſe upon anatomical ſubjects; they are as follows: 1. "Spicilegium Anatomicum, continens Obſervationum Anatomicarum rariorum Centuriam unam, necnon Oſteogeniam Fœtuum, in quâ, quid cuique oſſiculo ſingulis accedat menſibus, quidque decedat & in eo per varia immutetur tempora, accuratiſſimè oculis ſubjicitur." Amſt. 1670, 1673. 2. "Anthropogeniæ ichnographia, ſive, conformatio Fœtus ab ovo uſque ad oſſificationis principia, in Supplementum Oſteogeniæ Fœtuum." (Ibid. 1671.) In this work the developement of the fœtus, at different periods of its age, is traced with great attention and minuteneſs. 3. "Commentarius in Currum Triumphalem Antimonii Baſ. Valentini." (Ibid. 1671.) This is chiefly a tranſlation of Baſil Valentine's work, from the

German to the Latin. A poſthumous collection of his anatomical writings was publiſhed at Leyden in 1717, with the title of "Opera omnia Anatomica." Eloy. Dict.

KERCOLANG, in *Geography*, an iſland in the Eaſt Indian ſea, about 80 miles in circumference, inhabited by Malays. N. lat. of the north extremity 4° 28′. E. long. 126 30′.

KERDA, a town of Sweden, in the province of Smaland; 38 miles W.N.W. of Wexio.

KERDECAN, a town of Perſia, in the province of Kerman; 22 miles N.W. of Sirgian.

KERDISTAN, a town of Perſia, in Chuſiſtan; 90 miles E.S.E. of Suſter.

KERDIZ, a town of Candahar, in Cabuliſtan; 70 miles E. of Ghizni.

KEREDGE, a town of Perſia, in Irak; 15 miles S.W. of Sava.

KERELO, a town of Tranſylvania, on the Maros; 20 miles W.N.W. of Scheſburg.

KEREMPIBURUN, called *Cape Crampe*, a cape on the N. coaſt of Natolia, on a neck of land which projects into the Black ſea. N. lat. 42° 45′. E. long. 33° 10′.

KEREN, a town of Perſia, in Irak; 45 miles W. of Kermanſha.

KERESBANJA, a town of Tranſylvania; 44 miles S.S.W. of Coloſvar. N. lat. 46° 16′. E long. 22 25′.

KERESOUN, a town of Turkiſh Armenia, at the mouth of a river of the ſame name, which runs into the Black ſea, anciently a city of Pontus, called *Ceraſus*; which ſee.

KERESZTUR, a town of Tranſylvania; 36 miles N. of Scheſburg.

KERET, a town of Ruſſia, in the government of Archangel, on the White ſea; 148 miles S. of Kola.

KERETSKOI, a town of Ruſſia, in the government of Archangel, on the White ſea; 32 miles N. of Archangel.

KERF is the notch or ſlit that is made by the ſaw between two pieces of wood, when they are ſawing aſunder.

KERFE-KARUMFEL, in the *Materia Medica*, a name given by Avicenna, and others, to the wood of the clove-tree, as the wood of the cinnamon-trre was called *kerſe darſini*; and many others in the ſame manner.

KERGONG, in *Geography*, a town of Hindooſtan, in Candeiſh; 45 miles S. of Indore.

KERGUELEN's LAND, otherwiſe called the *Iſland of Deſolation*, an iſland in the Southern Indian ocean, firſt diſcovered in 1772, and afterwards viſited, in 1773, by M. de Kerguelen, who, in his ſecond voyage, diſcovered ſome other ſmall iſlands in its vicinity. Kerguelen has, ſince the death of captain Cook, publiſhed the journal of his proceedings in theſe two ſucceſſive voyages, and has annexed to his narrative a chart of the coaſts of this land, as far as he had explored them in both voyages. M. de Pagés, much about the ſame time, favoured the public with another account of the ſecond voyage, in ſome reſpects fuller than Kerguelen's own, on board of whoſe ſhip he was then an officer. Captain Cook fell in with theſe iſlands in December 1776; and of the firſt he ſays, that it is an iſland of conſiderable height, and about three leagues in circuit. To this iſland Kerguelen had given the name of "Croy," or "Crouy;" and the view of it in his chart exactly correſponds with Cook's account of its being of conſiderable height. Cook obſerved another iſland of the ſame magnitude, one league to the eaſtward, which Kerguelen had called "Iſle Rolland," after the name of his own ſhip, and of which he has given a view in his chart. Between theſe two iſlands Cook obſerved ſome ſmaller ones in the direction of S.E. In the direction S. by E. ¼ E. from the E. end of the firſt iſland, a third high iſland was ſeen. This appears to have been Kerguelen's "Iſle de Clugny," as marked on his chart. Another iſland in the N.E. direction was a high round rock, named by captain Cook 'Bligh's Cap," which he juſtly concluded to be the ſame which M. de Kerguelen called the "Iſle of Rendezvous," though Cook ſays "I know nothing that can rendezvous at it but fowls of the air; for it is certainly inacceſſible to every other animal." Bligh's Cap was aſcertained to be in S. lat. 48° 29′. E. long. 68° 40′. The French and Engliſh navigators agree very nearly with reſpect to the latitude of this iſland; but they differ as to its longitude. The pilot at Teneriffe made it only 64° 57′ E. from Paris, which is about 67° 16′ E. from London; or 1° 24′ more weſterly than captain Cook's obſervations fix it. M. de Pagés ſays it is 66° 47′ E. from Paris, that is, 69° 6′ E. from London, or 26 miles more eaſterly than it is placed by captain Cook. Kerguelen himſelf only ſays, that it is *about* 68° E. long. The northern point of this land captain Cook erroneouſly concluded to be the "Cape Louis" of the firſt diſcoverers; whereas, by an inſpection of Kerguelen's chart, this northern point deſcribed by Cook, is the ſame with that to which the French have given the name of "Cape François." The whole extent of coaſt lying between Cape Louis and Cape François, of which the French ſaw very little during their firſt viſit in 1772, and which may be called the N.W. ſide of this land, they had it in their power to trace the poſition of in 1773; and they have aſſigned names to ſome of its bays, rivers, and promontories upon their chart. On the 25th of December (Chriſtmas day), captain Cook anchored in the harbour from this circumſtance denominated "Chriſtmas Harbour," which ſee. On the 27th many of the ſhip's crew went on ſhore, and made excurſions, in different directions, into the country, which they found barren and deſolate in the higheſt degree. They brought with them a quart bottle, which was found faſtened with wire to a projecting rock on the N. ſide of the harbour. This bottle contained a piece of parchment, with the following inſcription: "Ludovico XV. Galliarum rege, et D. de Boynes regi a ſecretis ad res maritimas annis 1772 et 1773." Captain Cook, as a memorial of having been in this harbour, cauſed to be written on the other ſide of the parchment this inſcription: "Naves Reſolution et Diſcovery de Rege Magnæ Britanniæ, Decembris 1776." This parchment was put again into a bottle with a ſilver two-penny piece of 1772; and the bottle, having been covered with a leaden cap, was placed on a pile of ſtones erected for the purpoſe, upon a little eminence on the N. ſhore of the harbour, near the place where it was firſt found. The Chriſtmas harbour of captain Cook is the ſame with the "Baie de l'Oiſeau" of the French, and Cape François, and not Cape St. Louis, is the northern point of this land; and the account of the S. point of the harbour given by M. de Pagés and captain Cook remarkably agree. The land on both ſides of the inlet is high, and it runs in W., and W.N.W. about two miles. Its breadth is 1¼ mile, for more than half its length; above which it is only half a mile. The depth of water is 45 fathoms at the entrance, and varies, in proceeding farther inward, from thirty to five and four fathoms. The ſhores are ſteep, and the bottom is every where a fine dark ſand, except near the ſhore, where are beds of ſea-weed. The head of the harbour lies open only to two points of the compaſs; and even theſe are covered by iſlands in the offing, ſo that no ſea can fall in to hurt a ſhip. It is high water here at the full and change days, about 10 o'clock; and the tide riſes and falls about four feet. Captain Cook explored this iſland, and other iſlands adjacent to it, with a view of extending Kerguelen's diſcovery. After having anchored in another harbour, called "Port Palliſer," and ſituated in S. lat. 49° 3′. E. long. 69° 37′, and finding no encouragement to continue his reſearches, captain Cook put to ſea. The French diſcoverers, with ſome reaſon, imagined Cape François to be the projecting point of a ſouthern continent. "The Engliſh have ſince proved that no ſuch continent exiſts; and that the land in queſtion is an iſland of no great extent, which, from its ſterility," ſays captain Cook, "I ſhould, with great propriety, call the "Iſland of Deſolation," but that I would not rob M. de Kerguelen of the honour of its bearing his name." Kerguelen now concurs with captain Cook as to its being an iſland: but he apprehends, that it is about 200 leagues in circuit; and he ſays, that he was acquainted with about 80 leagues of its coaſt. After all, it cannot but be remarked, that Kerguelen was peculiarly unfortunate, in having done ſo little to complete what he had begun. He diſcovered, indeed, a new land, but, in two expeditions to it, he could not once bring his ſhips to an anchor upon any part of its coaſts. Captain Cook had either fewer difficulties with which to ſtruggle, or was more ſucceſsful in ſurmounting them. From the account of Mr. Anderſon, ſurgeon to captain Cook, who loſt no opportunity of ſearching the country in every direction, we make the following extract.

"Perhaps no place, hitherto diſcovered in either hemiſphere, under the ſame parallel of latitude, affords ſo ſcanty a field for the naturaliſt as this barren ſpot. The verdure, which appears when at a little diſtance from the ſhore, would flatter one with the expectation of meeting with ſome herbage; but in this we were much deceived. For on landing, we ſaw that this lively colour was occaſioned only by one ſmall plant, not much unlike ſome ſorts of ſaxifrage, which grows in large ſpreading tufts to a conſiderable way up the hills. It forms a ſurface of a pretty large texture, and grows on a kind of rotten turf, into which one ſinks a foot or two at every ſtep. This turf, dried, might, in caſes of neceſſity, ſerve for fuel, and is the only thing we met with here that could poſſibly be applied to this uſe. There is another plant, plentifully enough ſcattered about the boggy declivities, which grows to near the height of two feet, and not much unlike a ſmall cabbage, when it has ſhot into ſeeds. The leaves about the root are numerous, large, and rounded; narrower at the baſe, and ending in a ſmall point. Thoſe on the ſtalks are much ſmaller, oblong, and pointed. The ſtalks, which are often three or four, all riſe ſeparately from the root, and run into long cylindrical heads, compoſed of ſmall flowers. It has not only the appearance, but the watery acrid taſte of the antiſcorbutic plants, and yet differs materially from the whole tribe; ſo that we looked upon it as a production entirely peculiar to the place. We ate it frequently raw, and found it almoſt like the New Zealand ſcurvy-graſs. But it ſeemed to acquire a rank flavour by being boiled." In our gardens it might, by cultivation, ſo far improve as to be an excellent pot-herb. Two other ſmall plants were found near the brooks and boggy places, which were eaten as ſallad; the one almoſt like garden creſſes, and very fiery; and the other very mild. This laſt, though but ſmall, is in itſelf a curioſity; having not only male and female, but what the botaniſts call androgynous plants. A coarſe graſs, which we cut down for the cattle, grows pretty plentifully in a few ſmall ſpots about the ſides of the harbour, with a ſmaller ſort, which is rarer: and upon the flat ground, a ſort of gooſe-graſs, and another ſmall plant much like it. In ſhort, the whole catalogue of plants does not exceed ſixteen or eighteen, including ſome ſorts of moſs, and a beautiful ſpecies of lichen, which grows upon the rocks higher up than the reſt of the vegetable productions. Nor is there even the leaſt appearance of a ſhrub in the whole country. "Nature has been rather more bountiful in furniſhing it with animals; though, ſtrictly ſpeaking, they are not inhabitants of the place, being all of the marine kind; and, in general, only uſing the land for breeding, and for a reſting-place. The moſt conſiderable are ſeals, or (as we uſed to call them) ſea-bears; being that ſort called the urſine ſeal. Theſe come aſhore to reſt or breed; but they were not very numerous; which is not to be wondered at, as it is known, that theſe animals rather frequent out-rocks, and little iſlands lying off coaſts, than bays or inlets. They were, at this time, ſhedding their hair, and ſo tame, that we killed what number we choſe. No other quadruped, either of the ſea or of the land kind, was ſeen; but a great number of birds, *viz.* ducks, petrels, albatroſſes, ſhags, gulls, and ſea-ſwallows." Penguins form by far the greateſt number of birds here, and are of three ſorts. The ſhags of this place are of two ſorts; the leſſer cormorant or water-crow, and another which is black above with a white belly; the ſame that is found in New Zealand, Terra del Fuego, and the iſland of Georgia. Another ſort of white bird, flocks of which flew about the bay, is very ſingular; having the baſe of the bill covered with horny cruſt. It is larger than a pigeon, with the bill black and the feet white, made like thoſe of a curlew. Some of the people put it in competition with the duck, as food. The ſeine was hauled once, but we found only a few fiſh about the ſize of a ſmall haddock." "The only ſhell-fiſh are a few limpets and muſcles, and, among the ſtones, a few ſmall ſtar-fiſh and ſea-anemonies were found.

"The hills are of a moderate height; yet many of their tops were covered with ſnow at this time, though anſwering to our June. Some of them have large quantities of ſtone irregularly heaped together at their foot, or on their ſides. The ſides of others, which form ſteep cliffs towards the ſea, are rent from the top downward, and ſeem ready to fall off, having ſtones of a conſiderable ſize lying in the fiſſures. Some were of opinion, that froſt might be the cauſe of theſe fiſſures, which I ſhall not diſpute; but how others of the appearances could be effected, but by earthquakes, or ſome ſuch ſevere ſhocks, I cannot ſay."—"It appears that rain muſt be almoſt conſtant here, not only from the marks of large torrents having ruſhed down, but from the diſpoſition of the country, which, even on the hills, is almoſt an entire bog or ſwamp, the ground ſinking at every ſtep. The rocks, or foundations of the hills, are compoſed chiefly of a dark blue, and very hard ſtone, intermixed with ſmall particles of glimmer or quartz." "Another browniſh brittle ſtone forms here ſome conſiderable rocks; and one which is blacker, and found in detached pieces, incloſes bits of coarſe quartz. A red, a dull yellow, and a purpliſh ſandſtone are alſo found in ſmall pieces; and pretty large lumps of ſemi-tranſparent quartz, diſpoſed irregularly in polyedral pyramidal cryſtals of long ſhining fibres. Some ſmall pieces of the common ſort are met with in the brooks, made round by attrition; but none hard enough to reſiſt a file. Nor were any of the other ſtones acted on by aquafortis, or attracted by the magnet. Nothing, that had the leaſt appearance of an ore or metal, was ſeen." S. lat. 49° 20′. E. long. 69° 30′. Cook's Third Voyage, vol. i.

KERI-CHETIB, are various readings in the Hebrew bible: *keri* ſignifies that which is read; and *chetib* that which is written. (See CHETIB *and* KERI.) It is generally ſaid by the Jewiſh writers, that theſe corrections were introduced by Ezra; but it is moſt probable that they had their original from the miſtakes of the tranſcribers after the time of Ezra, and the obſervations and corrections of the Maſorites. Thoſe keri-chetibs, which are in the ſacred books written by Ezra himſelf, or which were taken into the canon after his time, could not have been noticed by Ezra himſelf; and this affords a preſumption, that the others are of late date. Theſe words amount to about a thouſand; and Dr. Kennicott, in his "Diſſertatio Generalis," remarks, that all of them, excepting fourteen, have been found in the text of manuſcripts.

KERJE, or El Kerdsje, in *Geography*, a diſtrict of the province of Neged, or Nedsjed, in Arabia, lying on the S.W. part of this province, and of courſe on the frontiers of Yemen, extending along the eaſt of Hedsjaz, or Hejaz, a conſiderable way to the N. In this diſtrict is the city of Imam, famous even before the days of Mahomet, for being the native city of Mozeilama, who ſet himſelf up as a prophet. This province alſo compriſes other towns, among which is Salernia, on the confines of Yemen.

KERIGAR, a town of Hindooſtan, in the ſoubah of Oude; 80 miles N. of Lucknow. N. lat. 28° 12′. E. long. 81° 25′.

KERIKERD, a town of Perſia, in Chuſiſtan, taken by Timur Bec in 1393; 15 miles N. of Suſter.

KERIMGUNGE, a town of Hindooſtan, in Bahar; 24 miles E.S.E. of Hajypour.

KERION, a town of Thibet, 24 miles N.W. of Serangpour. N. lat. 32° 35′. E. long. 83°.

KERISONGAR, a lake of America, in the diſtrict of Maine, which ſends its waters to Penobſcot river.

KERIST, a town of Perſia, in Farſiſtan; 106 miles S.S.E. of Schiras.

KERKA, a town of Perſia, in Chuſiſtan; 45 miles W. of Toſtar.

KERKELAN, a town of Aſiatic Turkey, in the government of Sivas; 30 miles W.S.W. of Amaſieh.

KERKENI, a ſmall iſland near the E. coaſt of Tunis. N. lat. 34° 59′. E. long. 11° 12′.

KERKER, a town of Aſiatic Turkey, in Aladulia, on the Euphrates; 30 miles S. of Malatia.

KERKHA, a town of Perſia, in Chuſiſtan, on the Karaſu; 15 miles N. of Suſter.

KERKHERDERE, John Gerard, in *Biography*, a learned profeſſor of the univerſity of Louvain, was born in the neighbourhood of Maeſtricht, about the year 1678. He purſued his academical ſtudies at Louvain, and diſtinguiſhed himſelf during ſeveral years for his accurate and comprehenſive knowledge of hiſtory and the belles-lettres. In 1708, he was appointed hiſtoriographer to the emperor Joſeph I., and died in the year 1738. He was author of many works in general hiſtory and theology, of which the principal are entitled "De Monarchia Romæ Paganæ ſecundum Concordiam inter S. S. Prophetas Danielem et Joannem, &c.:" and "Prodromus Danielicus ſive novi Conatus hiſtorici, critici, in celeberrimas difficultates Hiſtoriæ veteris Teſtamenti." Theſe pieces are diſtinguiſhed by profound erudition and great critical acumen, and are ſaid to throw much light on many obſcure paſſages in the ſcriptures relating to hiſtory, chronology, and geography. He publiſhed a Latin grammar, and a number of Latin poems.

KERKIL, or Ghergil, in *Geography*, a town of Curdiſtan; 35 miles S.S.E. of Amadieh.

KERKISIA, or Kerkisieh, a town of Aſiatic Turkey, in the province of Diarbekir, now decayed; eight miles N. of Rabba. N. lat. 35° 18′. E. long. 40° 10′.

KERKONI, a town of Georgia; 25 miles S.W. of Teflis.

KERKUK, a town of Curdiſtan, the capital of a government, and reſidence of a pacha; ſurrounded with walls and defended by a caſtle; 150 miles N. of Bagdad. N. lat. 35° 59′. E. long. 43° 42′.

KERKWYCK, a town of Holland, in the department of Guelderland; two miles S. Bommel.

KERL, John Gaspar, in *Biography*, a native of Saxony, but having acquired in early youth great reputation as an organ player, he was called to Vienna by the archduke Leopold, and appointed organiſt at his court; and manifeſting ſigns of extraordinary genius for compoſition, he was placed under Giovanni Valentini, maeſtro di cappella at the Imperial court, and afterwards ſent to Rome to ſtudy under Cariſſimi. Upon his return to Germany, great offers were made to him from the elector palatine, if he would enter into his ſervice; but he declined them, and preferred ſettling at Munich, where he became maeſtro di cappella to the elector of Bavaria, Ferdinando Maria. His principal work as a compoſer was his "Modulatio organica ſuper Magnificat Octo Tonis Eccleſiaſticis Reſpondens," engraved and publiſhed at Munich, in 1686. Kerl was eſteemed one of the moſt able and ſkilful organiſts of his time. In a competition with ſome Italian muſicians at the court of the elector of Bavaria, he is ſaid by Walther to have compoſed a piece for the organ of wonderful contrivance, which none but himſelf could execute.

KERLE, Jacob de, canon of the cathedral of Cambray, from Ypres, was a very voluminous compoſer, contemporary with Gaſpar. He publiſhed "Pecces ſpecialis ſucceſſu," in 1569; "Caſmen Italica muſicis modulis ornata," 1570; "Cantiones ſacras, 5 & 6 vocum," 1571; in 4to. Venice, 1573, two, four, and five-part motetti, four and five-part maſſes, and a Te Deum.

KERLEH, in *Geography*, a circar of Hindooſtan, in Berar, N.W. of Goondwana, and S.E. of Hindia and Bopaltol.

KERMAN, anciently *Caramania*, a province of Perſia, bounded on the N. by Segeſtan, on the E. by Mekran, on the S. by the Perſian gulf, and on the W. by Farſiſtan and Lariſtan. The northern part is barren and almoſt deſert, without rivers or brooks, and the air unhealthy; towards the S. the air is more pure, and the land fertile. This province contains a city of the ſame name (ſee Sirgian); but ſome authors repreſent Yezd as the capital. (See Yezd.) The Guebres in this province are numerous; and are chiefly employed in manufactures of ſtuffs and ſilk. Here are ſome mines of copper, lead, and iron. The great deſert of Kerman joins with the Great Saline deſert, by the Nauben Dejiam, and extends about 350 miles. The Saline deſert extends from the vicinity of Kom to that of the ſea of Zurra, in a line from E. to W. of about 400 Britiſh miles; the breadth from N. to S. being about 250. Theſe two extenſive deſerts may be conſidered as ſtretching N.W. and S.E. for a ſpace of about 700 miles, by a medial breadth of about 200 (without including in the length other 200 miles of the deſert of Mekran), thus interſecting the wide empire of Perſia into two nearly equal portions. This vaſt extent is impregnated with nitre and other ſalts, which taint the neighbouring lakes and rivers.

Kerman. See Sirgian.

KERMANA, a town of Hindooſtan, in Oude; 40 miles E. of Bahraiteh.

KEMANSHER, a town of Perſia, in the province of Kerman; 130 miles S.E. of Sirgian. N. lat. 28° 20′. E. long. 58° 50′.

KERMANTSCHUK, a town of Circaſſia, near which the Mogul Tartars were ſurpriſed by the Ruſſians in 1783, and defeated with great loſs.

KERMASIN, a town of Perſia, in the province of Kerman; 160 miles S.E. of Sirgian.

KERMES, a kind of little animal, found in great plenty in many parts of Aſia and the S. of Europe, on an evergreen of the oak kind, and forming excreſcences, or *niduſes*, of conſiderable uſe, both in phyſic and dyeing. That which was brought from Galatia and Armenia was formerly preferred; but at preſent it is chiefly gathered in Languedoc, Spain, and Portugal.

The kermes, called alſo *ſcarlet grain*, and by the Greeks *coccos baphica*, by the Latins *vermiculus*, by the French ſometimes *vermilion*, or *grain de gale*, or *vermeil*, is about the ſize of a juniper-berry, round, ſmooth, and gloſſy; of a beautiful red colour, and full of a mucilaginous juice, of the ſame dye; it is found adhering to the bark on the ſtem and branches of a peculiar ſort of ſcarlet oak. See Coccus *Ilicis*.

Kermes has been ſuppoſed to derive its name from an Arabic word, ſignifying a little worm, *vermiculus*, whence it has been called vermilion. Aſtruc deduces the name from two Celtic words, one of which ſignifies an oak, the other an acorn.

This inſect hangs to the tree from which it is gathered by means of a cottony down, which, according to M. Chaptal, has many characteriſtics of the caoutchouc, being inſoluble in alcohol, melting at the heat of boiling water, and burning with a flame on the coals. In Languedoc, about the middle of May, when this inſect has attained to its proper ſize, and when in colour and ſhape it reſembles a ſmall ſloe, the harveſt commences, and the peaſants begin to gather it. This harveſt continues till about the middle of June, or later, if the great heats be retarded, or no violent rains fall; for one heavy ſtorm of rain puts an end to the gathering for that year. The perſons employed in this buſineſs are women, who ſet out early in the morning, with a lanthorn and a glazed earthen pot, ſo as to pick off the kermes from the branches before day, which is the moſt favourable time for this buſineſs. A ſingle perſon may gather from one to two pounds a day. At the commencement of the harveſt, the kermes weighs more, but fetches a leſs price than at the end, when it is drier and lighter.

According as the winter has been more or leſs mild, the harveſt of kermes is the more or leſs plentiful; and the people always preſage themſelves a fine ſeaſon, when the ſpring has been free from froſts and fogs. It is obſerved, that the loweſt and oldeſt ſhrubs are always the fulleſt of this inſect; and the kermes produced on thoſe trees, which are in the neighbourhood of the ſea, is always larger and finer than from the inland places.

It is no uncommon thing to have two harveſts of kermes in a year. Thoſe of the latter ſeaſon are ſmaller and leſs valuable than thoſe of the firſt, and are found not on the branches, but on the leaves of the ſhrub; which is juſt analogous to the cuſtom of the gall-inſects of all other kinds; all which, about this age, leave the branches to feed on the leaves, where their yet tender trunks can find an eaſier entrance.

From this analogy between the kermes, and other inſects of the ſame claſs, it ſhould ſeem worth while to try, whether ſome of thoſe may not poſſeſs the ſame virtues in medicine, at leaſt, if not in the arts. It is certain that the common oak produces a red-gall inſect of the very ſhape of the kermes, and of the colour of the paler ones. Reaumur. See the article Coccus.

The kermes is of a vinous ſmell, a bitter, rough, and pungent taſte; and its pulp, or juice, is pregnant with numerous minute ova.

The animal retains theſe ova under her belly, till they hatch into a very numerous offspring.

Hence, when the kermes is dried, there comes out of it an infinite number of little inſects, and flies, ſo ſmall, that they are ſcarcely viſible; inſomuch, that the whole inward ſubſtance ſeems converted into them. This ſhell is nothing but the body of the mother, diſtended by the growth of the eggs. To prevent this inconvenience, they uſually ſteep the kermes in vinegar before it be dry; and thus prevent the excluſion of the ova, and kill ſuch animals as are already hatched. It is afterwards dried on linen cloths. This operation gives it a colour like that of red wine. They draw the juice, or pulp, from the kermes, by pounding it in a mortar, and then ſtraining it through a ſieve: of this they make a ſyrup, by adding a ſufficient quantity of ſugar. Sometimes they dry the pulp ſeparate from the huſk; which pulp, thus dried, they call *paſtel of kermes*. If the living inſect be bruiſed, it gives out a red colour.

The kermes was formerly of great uſe in phyſic: eſteemed to be cardiac, deſiccative, and aſtringent; to fortify the ſtomach, and prevent abortion. Of this was made that celebrated confection called *alkermes*.

The reſtringent and corroborant confection that was ſold in the ſhops, was prepared by diſſolving, in the heat of a water-bath, ſix ounces of fine ſugar, in ſix ounces, by meaſure, of damaſk roſe-water; then adding three ounces of the juice of kermes, warmed and ſtrained; and after the whole had grown cold, mixing half a ſcruple of oil of cinnamon. This confection was taken, from a ſcruple to a dram, or more, either by itſelf, or in juleps, with which it mingles uniformly, without injuring their tranſparency.

The dried grains of kermes, if they have not been too long kept, give out, both to water and to rectified ſpirit, the ſame deep red colour, and nearly the ſame kind of ſmell and taſte with thoſe of the expreſſed juice. The inſpiſſated extracts are conſiderably bitter, aſtringent, and of a kind of mild balſamic pungency.

It is, however, of greater uſe in dyeing ſcarlet; for which uſe, the manner of preparing it is as follows: the kermes being taken when ripe, they ſpread it on linen; and at firſt, while it abounds moſt in moiſture, turn it twice or thrice a day, to prevent its heating, till ſuch time as there appears a red powder among it: this they ſeparate, by paſſing it through a ſieve, and then again ſpread abroad the grain on the linen, till they perceive the ſame redneſs of powder, when they repeat the ſifting: thus they proceed, while they diſcover any red powder on the ſurface of the grain, which is ſtill paſſing through the ſearce, till it yield no more.

In the beginning, when the ſmall red grains are found to move, as they will always do, they are ſprinkled over with ſtrong vinegar, and rubbed between the hands. Were not this precaution taken, out of every grain would be formed little inſects, which would be of no uſe in dyeing.

The grain being quite emptied of its pulp, or red powder, by the proceſs above-mentioned, is waſhed in wine, and then expoſed to the ſun; after this, it is put up into the huſks, formed into balls, and along with it the proportion of red duſt that it had afforded.

According to M. Marſigli's experiments, made at Montpellier, the kermes has the effect of galls, when mixed with vitriol; and makes a good ink: mixed with oil of tartar, or lime-water, its colour turns from a vermilion to a crimſon colour. In a decoction of turnſol flowers, it retains its proper colour. They have not been able to get any fixed eſſential ſalt from it; but a volatile ſalt it yields in abundance; which, in M. Marſigli's opinion, would have a better effect in medicine, if taken in a liquid, than when encloſed in conſerves and confections, which hinder its action.

Woollen cloth, prepared with alum and tartar, acquires, on being boiled with dry kermes berries, a durable deep red colour, called *ſcarlet in grain*, from the kermes having been formerly ſuppoſed to be the grain or ſeed of the tree; and *Venice ſcarlet*, from the greateſt quantities having been dyed there. This colour wants the luſtre and fire of the cochineal ſcarlet now in vogue, but in return is far more permanent, nor ſubject to be ſtained by dirt, or acrid liquors; and when ſpotted with greaſe, may be cleaned again without injury to the colour.

Mr. Hellot obſerves, that the figured cloths to be ſeen in the old tapeſtries of Bruſſels, and the other manufactures of Flanders, which have ſcarcely loſt any thing of their livelineſs in ſtanding for two hundred years, were all dyed with this ingredient; that, neverthleſs, kermes is at preſent entirely in diſuſe among the European dyers, though ſaid to be commonly employed in the Levant, and exported thither from Marſeilles in conſiderable quantities: that when the kermes ſcarlet (now called an ox-blood colour) is wanted for tapeſtries, &c. our dyers endeavour to imitate it with cochineal; that as the colour is difficultly hit with cochineal alone, they generally add a portion of Brazil wood; and that the dyes thus produced, though at firſt more vivid than they ought to be, often loſe their luſtre before a year is at an end, and turn white and grey in an extraordinary manner: that kermes might again be introduced to very good advantage, as its colour is of the moſt durable kind, and as ſundry ſhades are obtainable from it with leſs trouble and expence than from other drugs.

The ſame author has given a great number of experiments upon kermes, with different ſalts and metallic ſolutions. The principal of theſe are as follow:

On adding to the decoction of kermes a ſmall quantity of ſolution of tin, the dark colour of the liquor is immediately brightened, and prepared woollen dyed therein, inclines more to the orange than with the kermes alone. With this improvement of the colour, it receives the imperfections, though not all the beauty of the cochineal ſcarlet; all alcaleſcent ſubſtances ſtaining the cloth, that is, deſtroying the effect of the acid ſolution.

Kermes, with cream of tartar, and as much of the ſolution of tin as is employed for the cochineal ſcarlet (without any alum) dyed unprepared cloth of an extremely vivid cinnamon colour. On dipping the cloth in a ſolution of alum, a part of the red re-appeared, but was not beautiful.

With cream of tartar, ſolution of tin, and alum in larger quantity than the tartar, this drug gives purpliſh colours, which vary according to the proportions of the ingredients.

If vitriolated tartar be ſubſtituted to the alum and tartar; and if after the kermes has been boiled in a ſolution of a ſmall quantity of this ſalt, the ſtuff be boiled in this mixture for about an hour, the dye proves a beautiful kind of grey, in which the red is little perceived.

Glauber's ſalt, employed along with kermes, entirely deſtroys its redneſs, and gives an earthy grey colour. This dye is very periſhable, on account of the particular nature of the ſaline ſubſtance, by means of which the tinging particles are applied; for Glauber's ſalt diſſolves eaſily in cold water, and falls into a powder in the ſun's heat. This obtains equally in all dyes; thoſe drugs which afford moſt durable colours with tartar and vitriolated tartar, give very periſhable ones with the more diſſoluble and calcinable ſalts.

Green and blue vitriol, ſubſtituted ſeparately to alum, but taken in conjunction with cream of tartar, deſtroy likewiſe, or conceal the red colour of kermes, which in theſe two experiments has the ſame effect with galls, for it precipitates the iron of the green vitriol which tinges the cloth of a bright grey, and the copper of the blue, which gives a kind of olive dye. It likewiſe gave an olive dye with ſolution of copper made in aquafortis; a certain mark, that it poſſeſſes, like galls, an aſtringent precipitating quality. It is probably the aſtringency of kermes that renders its dye ſo durable; for all the barks, woods, roots, and other ſubſtances that are aſtringent, yield permanent colours.

White vitriol, employed with cryſtals of tartar, changes the red colour of kermes into a violet. A tincture of biſmuth ore, in ſpirit of nitre, and a ſolution of biſmuth itſelf made leiſurely in four times its weight of ſpirit of nitre, diluted with an equal quantity of water, gave alſo a violet dye upon white cloth. All acids convert it to a cinnamon colour, which inclines more or leſs to red, according as the acids are weak, and their quantity ſmall. Alkalies render its colour dull and dry. See Neumann's Chemiſtry, by Lewis, p. 508, &c.

To dye ſpun worſted with kermes, it is firſt boiled half an hour in water with bran; then two hours, in a freſh bath, with one-fifth of Roman alum, and one-tenth of tartar, to which ſour water is commonly added: after which it is taken out, tied up in a linen bag, and carried to a cool place, where it is left ſome days to obtain a full colour. As much kermes as equals three-fourths, or even the whole of the weight of the wool, is put into a warm bath, and the wool is put in at the firſt boiling. As cloth is more denſe than wool, either ſpun or in the fleece, it requires one-fourth leſs of the ſalts in the boiling, and of kermes in the bath. Leſs proportions of kermes will produce lighter and paler colours. If a ſucceſſion of ſhades be wanted, we muſt, as uſual, begin with the deepeſt. Hellot directs a ſmall handful of cot or refuſe wool to be thrown into the boiler in which the kermes is, and to let it boil a moment before the wool to be dyed is put in. This will abſorb a kind of black dregs, and the wool afterwards dipped will take a better colour. Before the wool that is juſt dyed is taken to the river, it may be dipped in a bath of water a little warm, in which a ſmall quantity of ſoap has been diſſolved. In this way the colour will acquire more brightneſs, though it will be rendered a little roſy, that is, will have a crimſon caſt. The colour imparted by kermes to wool, has much leſs bloom than the ſcarlet made with cochineal; whence the latter has been generally preferred, ſince the art of heightening its colour by means of ſolution of tin has been known. Berthollet.

Kermes *Mineral*, or, in modern language, the hydroſulphuret of antimony. The kermes mineral was a preparation of Glauber, which the king of France bought of M. de la Ligerie, and made public in 1720. That receipt was in the following form: take a pound of Hungarian antimony, broken into thin pieces, according to the direction of its ſpicula; four ounces of nitre, fixed by charcoal; and a pint of rain water; boil them two hours; then filtre the warm liquor, and when it cools, the kermes precipitates. The ſame antimony undergoes the ſame operations with the remaining liquor, to which three ounces of fixed nitre, and a pint of water are added. In a third boiling, two ounces of nitre, and a pint of water are to be added to the former lixivium. The kermes thus obtained is about a dram, and is well edulcorated by waſhing it with water, and burning ſpirit of wine on it; then it is dried for uſe.

Mr. Geoffroy ſhews, by many experiments, that the kermes is the reguline part of the antimony, joined to a ſort of hepar ſulphuris. He teaches us a much eaſier way of preparing this medicine, thus: Mix intimately the fine powder of two parts of antimony, and one of any fixed alkaline ſalt; melt thoſe metals in a crucible; then having powdered them while hot, boil them two hours in a large quantity of water; after this, paſs the hot liquor through paper, receiving it into a veſſel, in which there is hot water, the kermes ſeparates when it cools. The groſſer parts, which do not paſs through the paper, are to be boiled again, and filtrated as before; and the operation is to be repeated a third time, by which ſix or ſeven drams of kermes may be got out of every ounce of antimony. He ſays, he has ſeen effects like to thoſe of mild kermes from antimony, reduced to ſuch a fine powder, that none of the ſhining ſpicula are to be ſeen; and that the magiſtery of antimony, made by pouring ſpirit of nitre, or aqua regia, on the powder of antimony, and then edulcorating the maſs with water, has the ſame effects as kermes. Mem. de l'Acad. des Sciences, 1734, 1735. For the modern method of preparing it, ſee Antimony.

Half a grain, or a grain of this powder, given every three or four hours, produces no violent effects; but by increaſing the doſe, it may be made to vomit, purge, and ſweat.

When ſeven or eight grains are taken at once, it chiefly acts upon the primæ viæ, generally as an emetic and purgative. A doſe of three or four grains is ſeldom emetic, and more frequently purgative. When taken in theſe quantities as an evacuant, a little of it paſſes alſo into the viæ ſecundæ & tertiæ. When it is adminiſtered in ſmaller doſes, it paſſes almoſt entirely into the lacteal blood and lymphatic veſſels. In theſe it occaſions ſuch ſpaſms and oſcillations as it does in the primæ viæ; ſo that it increaſes all ſecretions and excretions, but particularly thoſe of urine, ſweat, and expectoration; according to the doſe, the nature of the diſeaſe, and the diſpoſition of the patient. It produces ſingularly good effects in thoſe diſeaſes of the breaſt which proceed from fulneſs and obſtruction. It may be adminiſtered in any vehicle, or incorporated in a bolus, with other ſuitable remedies. But it ſhould never be joined with acids, when it is deſigned to act as kermes.

Some commend this medicine as the moſt univerſal reſolvent and deobſtruent; aſſuring us, that it almoſt infallibly cures pleuriſies, peripneumonies, aſthmas, catarrhs, anginæ, ſmall-pox, and many other diſeaſes. Others are as poſitive, that it heats and thickens the blood, thereby increaſing obſtructions, and is particularly hurtful in all inflammatory diſeaſes.

This preparation was famous in France, and known by the name of *poudre des Chartreux*, becauſe a Carthuſian monk, who got it from M. de la Ligerie, firſt brought it into vogue. See Hiſt. de l'Acad. des Sciences 1720, and the Memoirs for the ſame year, where it is ſaid that Glauber was looked upon as the firſt inventor of this remedy. Its effects, like thoſe of many other antimonial preparations, are very various, which is frequently owing, as Mr. Geoffroy obſerves, to the different manner and care in making it. He adds that the more the kermes contains of a regulus eaſily revivified, the more it proves emetic. He alſo ſhews how to make a cinnabar with the kermes and mercury, and ſo diſengage the vitriolic acid from the kermes. See Mem. de l'Acad. des Sciences, 1734. This preparation of antimony is now diſuſed; and in its room the pharmacopeias have adopted the "Sulphur antimonii præcipitatum vel auratum;" for the method of preparing and adminiſtering which, ſee Antimony.

KERMISE, in *Geography*, a town of Arabia, in the province of Nedsjed; 65 miles S.S.E. of Jamama.

KERN, or Kerne, a term in the ancient Iriſh militia, ſignifying a *foot-ſoldier*.

Camden tells us, the armies of Ireland conſiſted of cavalry, called *galloglaſſes*; and infantry, lightly armed, called *kernes*. The kernes bore ſwords and darts; to the laſt were fitted cords, by which they could recover them after they had been launched out.

Kern, in the *Engliſh Salt-works*, a word uſed to ſignify the cryſtallizing, or ſhooting of ſalt in the brine, when ſufficiently evaporated in the boiling pan.

This word is alſo uſed by the ſeamen for the firſt coming of the bay-ſalt, made by the ſun's heat in the iſles of May, &c. See Salt.

Kern-*ſtone*, in *Natural Hiſtory*, a name given by the common people of many parts of England, to a peculiar ſort of ſtone, which is found on the ſides of hills in ſandy countries, where the hills are rocky. Pyran ſands afford a great many ſtones of this kind; and the manner of their formation is thus: the rocks in the ſides of the hills are continually covered over with the looſe ſand, which the winds toſs up, and the ſparry matter continually oozing out of the pores of theſe ſtones, with the wet, cements the grain of ſand together. When one cruſt is thus formed, another is ſoon added, and ſo on till the whole maſs is of a conſiderable thickneſs; and the ſpar ſtill ſerving as a general cement, the whole is held together, though but in a looſe way, yet ſo as to reſemble a ſort of ſtone. The little grains of ſand are ſtill viſible in all parts of this ſtone, and are what induced the people to call it kern-ſtone, as they call theſe *kerns*, or *kernels*. This account of the origin of the ſtone is eaſily proved, by putting a ſmall piece of it into aquafortis, for this diſſolves the ſpar, or cement, and the ſand is left looſe.

KERNES, in our *Laws*, ſignify idle perſons, or vagabonds.

KERNING, in *Letter-Foundery*. See *Letter* Foundery.

KERONA, in *Geography*, a town of Hindooſtan, in the circar of Gohud; 15 miles N. of Datteah.

KEROWLY, a town of Hindooſtan, in the country of Agra; 74 miles S.W. of Agra. N. lat. 26° 27′. E. long. 77° 28′.

KERPEN, a town of France, in the department of the Roer, and chief place of a canton, in the diſtrict of Cologne; 10 miles E.S.E. of Juliers. N. lat. 50° 25′. E. long. 6° 41′. The place contains 1515, and the canton 10,419 inhabitants, in 37 communes.

KERRAH, a town of Hindooſtan, in Guzerat, on the gulf of Cambay; 65 miles S.S.W. of Gogo.

KERRERA, one of the ſmaller weſtern iſlands of Scotland, near the coaſt of Argyle, where, in 1249, Alexander II. died, when he was endeavouring to wreſt the iſland out of the poſſeſſion of the Norwegians; 12 miles S. of Liſmore. N. lat. 56° 23′. W. long. 5° 32′.

KERRI, a town of the Arabian Irak, at the conflux of the Tigris and Euphrates; 50 miles N.W. of Baſſorah.

KERROO, a town of Hindooſtan, in Viſiapour; 12 miles N.W. of Baddammy.

KERRY, a county of the province of Munſter, Ireland, ſituated on the ſouth-weſtern coaſt of the iſland. It is bounded on the north by the river Shannon, which divides it form the county of Clare; on the eaſt by the counties of Limerick and Cork; on the ſouth-eaſt by the latter county; and on the ſouth-weſt and weſt by the Atlantic ocean. Its form is very irregular in conſequence of two great projecting tongues of land, compriſing the baronies of Iveragh and

Corcaguinny. It extends from north to ſouth 53 (67½ Engliſh) miles, and in the broadeſt part from eaſt to weſt 41 (52 Engliſh) miles; and contains 1012 ſquare miles, or 647,650 Iriſh acres, equal to 1,040,487 Engliſh acres. It thus appears to be the fifth county of Ireland in point of extent, though after Galway its population is the thinneſt, and it is one of the moſt backward in point of culture. The number of houſes, at the time Dr. Beaufort wrote, was, by return to the houſe of commons, 19,395, which at 5½ to a houſe, would be 107,000. This, however, falls much ſhort of the preſent population. The number of pariſhes is 83, all in the dioceſe of Ardfert and Aghadoe, but by unions they are reduced to 40 benefices, in which are 20 churches and only three glebe houſes. Indeed, in this county the number of Roman Catholics is greater, in proportion to that of Proteſtants, than in almoſt any other. The number of members which repreſent this county in the Imperial parliament is three, two knights of the ſhire, and one member for the borough of Tralee. "It is not ſurpriſing," ſays Dr. Beaufort, "that this county ſhould be thinly inhabited; barren mountains, and almoſt inacceſſible rocks, render a large portion of it unfit for habitation and incapable of culture. Even the northern baronies, in which there is much good land, with few mountains, are far from level; and the cheerful aſpect of cultivated fields and fine paſtures, is frequently interrupted by bleak and ſtony hills; while tracts of bog interſect the narrow plain that extends from Caſtleman harbour to the borders of the county of Cork, between the Mang and the Fleſk. Grazing is more attended to than tillage, and this part of Kerry ſupplies many fat beaſts of good ſize, and great numbers of ſtore cattle; but the native breed of the country is extremely ſmall, yet remarkably good for the pail, reſembling the Alderney cow both in ſize and character; butter is conſequently a conſiderable article among the exports of Kerry. The barony of Corcaguinny forms a peninſula between the bays of Dingle and Tralee, and terminates at Dunmore Head, the moſt weſtern point of Ireland and of Europe. It is full of mountains, but the high promontory of St. Brandon is eminent above the reſt, and the mountain of Cahircouree ſtands acroſs the iſthmus. Among the rough and high hills in the barony of Iveragh, and the ſouthern part of Dunkerron, ſome pleaſant vallies and improveable grounds are interſperſed; and in the iſland of Valentia, there are more inhabitants and a better culture than could be expected in ſo remote a ſpot. Glanerought is entirely covered with exceeding high and rugged hills, and ſeparated from the county of Cork by an immenſe and almoſt impaſſable ridge of rocky mountains; over which there is but one paſs, and that very difficult, called the Prieſt's Leap; but the loftieſt mountains in this county ſtand in a huge aſſemblage on the weſt and ſouth of Killarney, half encompaſſing the lower, and entirely ſurrounding the upper lake. Of theſe, Mangerton is generally eſteemed the higheſt, being 2500 feet above the ſea, but it is doubted whether the craggy ſummits of Macgillicuddy's rocks do not ſurpaſs it in altitude. In this deſolate tract, there are large herds of red deer, and abundance of game." To this account of Dr. Beaufort's, publiſhed almoſt 20 years ago, there is very little to be added. The ſtate of agriculture is ſtill very low, though a few gentlemen have turned their attention to the improvement of it. The barony of Iveragh, in particular, is in a very rude ſtate. It ſhould be noticed that the horſes of Iveragh are much eſteemed; they are a ſmall but an excellent breed, climbing over the moſt rugged rocks, and both aſcending and deſcending the ſteepeſt precipices with great facility and ſafety. They are ſtrong and durable, eaſily ſupported, and not ill-ſhaped; ſo hardy as to ſtand abroad all winter, and will browſe upon heath, furze, and other ſhrubs; and they have an eaſy, ambling gait. The principal lake is Lough Lane, generally called the lake of Killarney, for an account of which, ſee KILLARNEY. Many fine rivers water this county. The Caſhing, which is formed by the union of the Feele and the Gale, is navigable for eight or ten miles. The Lane flows out of the lake of Killarney, which receives the Fleſk. The Roughy pours its impetuous current into Kenmare river. The Mang, which is navigable to Caſtlemain, was the northern boundary of the ancient counts palatine of Deſmond, and falls into Caſtlemain harbour, at the bottom of the great bay of Dingle, which can only admit veſſels of moderate burden. Ventry bay, the roads of Dingle and Valentia, and Ballynaſkelig's bay, are ſmall but commodious harbours. Kenmare river is a ſecure and capacious haven. The principal towns are Tralee, where the aſſizes are held, Killarney, Milltown, and Dingle, for which ſee the reſpective articles under thoſe names. This county has ſeveral marble and ſlate quarries, and is not deſtitute of coal mines, but the abundance and cheapneſs of turf render them uſeleſs. The mines of copper, lead, &c. near Killarney will be noted under that head; iron was formerly obtained in great quantity, till the ſcarcity of timber put a ſtop to the works. The cider of Kerry, which is made of the cockagee apple, is highly prized, and brings a great price; yet orchards are not very numerous, and that valuable fruit, with another excellent apple, the Kerry pippin, are little propagated, and difficult to be procured. The original poſſeſſors of this county were the O'Connors, O'Sullivans, and, above all, the M'Carthys, who were kings of Munſter. The Engliſh families of Fitzmaurice and Fitzgerald early obtained ſettlements in it, and the head of the latter, who was created earl of Deſmond, had the part of the county ſouth of the Mang erected into a county palatine. The power of this family became very great, and the earls were often in oppoſition to the Engliſh government. In queen Elizabeth's time an act of attainder was paſſed, and all the poſſeſſions of the houſe of Deſmond were divided amongſt Engliſh ſettlers. From theſe ſome of the principal Proteſtant families are deſcended. Beaufort's Memoir of a Map of Ireland. Smith's Hiſtory of Kerry.

KERRY *Head*, a cape of Ireland, in the county of Kerry, at the ſouth extremity of the mouth of the river Shannon. Near this, very fine quartz cryſtals, both white, and amethyſt are found, and for ſome time the latter were in great requeſt. A ſet of ear-rings, a necklace, and other jewels compoſed of theſe amethyſts, were preſented to queen Caroline. This cape is in N. lat. 52° 24'. W. long. 9° 47'. This cape is ſometimes called Ballyheigh Head. Smith. Beaufort.

KERRY *Point*, or, according to M'Kenzie, Kenry, a cape of the county of Down, Ireland. N. lat. 54° 22'. W. long. 5° 22'.

KERS, a town of Tyrol, on the river Inn; 12 miles N.E. of Landeck.

KERSCHAN, a town of Iſtria; 16 miles N.N.E. of Pedena.

KERSEY, JOHN, in *Biography*, an able mathematician and philologiſt, who flouriſhed towards the cloſe of the ſeventeenth, and beginning of the eighteenth centuries, and is chiefly known in the ſcientific world by his "Elements of Algebra," in two vols. folio, which is an ample and complete work, containing a full explanation of the problems of Diophantus: he was author likewiſe of "Dictionarium Anglo-Britannicum, or General Engliſh Dictionary."

Kersey, a kind of coarſe woollen cloth, made chiefly in Kent and Devonſhire.

KERSHAW, in *Geography*, a diſtrict of South Carolina, on Wateree river, which ſeparates it from Richland diſtrict; 35 miles long, and 30 broad, containing 7340 inhabitants, of whom 2530 are ſlaves.

KERUA, a town of Perſia, in the province of Kerman; 90 miles S.S.W. of Sirgian.

KERVIKER, a town of Natolia; 28 miles S.W. of Aphiom-kara-hiſſar.

KERUN, a lake of Egypt, in a diſtrict forming a kind of excreſcence to the weſt, about 30 miles long, and ſix broad; which has no appearance of being artificial.

KERYE', a town of Hindooſtan, in Baglana; 25 miles W. of Naſſuck.

KESALAX, a town of Sweden, in the government of Kuopio; 84 miles S.S.E. of Kuopio.

KESAVA, in *Mythology*, a name of the Hindoo deity Viſhnu; and of his principal avatara or incarnation of Kriſhna, and is ſaid to refer to the beauty of his hair. The name is alſo written Keſavi, and ſometimes pronounced Keſſu. Budha, or Viſhnu in that avatara, is alſo ſometimes addreſſed as Keſava.

KESAW, in *Geography*, a town of Hindooſtan, in Bahar; 48 miles S.S.W. of Patna.

KESBAH, a town of Bengal; 23 miles S.S.E. of Moorſhedabad.

KESCHIM, or Kesem, a ſea-port town of Arabia, in the province of Hadramaut, and the reſidence of a ſovereign prince. Its inhabitants are ſaid to be highly civilized, and to receive all ſtrangers hoſpitably. The Engliſh ſometimes viſit this harbour. The ſcheick of Keſchim is ſometimes called king of Fartak; and his dominions comprehend a conſiderable number of cities, among which is that of Fartak. Beſides his poſſeſſions on the continent, the ſcheick of Keſchim is likewiſe head of the iſland of Soccatra, famous for its aloes. N. lat. 15° 20′. E. long. 50° 2′.

KESELBAUDEN, a town of Bohemia, in the circle of Konigingratz; 18 miles N.N.E. of Gitſchin.

KESELDORF, a town of Bohemia, in the circle of Konigingratz; 10 miles E. of Gitſchin.

KESH, Kech, or *Sebz*, a town of Grand Bucharia, and capital of a diſtrict, of which Timur Bec was governor in 1360. This town was famous on account of its univerſity for the ſtudy of ſciences and law. It was the ordinary ſummer reſidence of Timur, and declared by him to be the ſecond ſeat of his empire: he encompaſſed it with walls, and built a new palace in 1379. It was alſo called "Chaber-Sebz," or the green city, from the verdure of the gardens and meadows celebrated for rare and beautiful plants; and alſo "Coubbet Elilmi Veladeb," which ſignifies the dome of ſcience and virtue; 30 miles S. of Samarcand. N. lat. 39° 10′. E. long. 64° 10′.

KESHAM, a town of Grand Bucharia; 70 miles W.S.W. of Badakſhan.

KESHIK-DAG. See Olympus.

KESHO, Kecho, or *Kacho*, a city of Aſia, capital of the kingdom of Tonquin and the royal reſidence, is ſituated upon the navigable river Songkoy, or San Koy, about 40 leagues from the ſea, and about 21° N. lat. With regard to ſize it may be compared with the moſt celebrated cities of Aſia, and may at leaſt equal that of Paris. On the 1ſt and 15th days of every moon are held great markets, which attract moſt of the inhabitants of the ſurrounding towns and villages to a conſiderable diſtance. The crowd is there ſo immenſe, that, though the ſtreets be very wide, it becomes difficult to advance 100 paces in half an hour. Yet great order prevails, each merchandize and village having diſtinct ſtreets for the expoſure of their articles. The ſtreets are paved with brick, except ſome parts which are left for the paſſage of horſes, elephants, and the king's carriages. Two-thirds of the houſes are of wood, others of brick, among which are the factories of foreign merchants, diſtinguiſhed amidſt a multitude of huts conſtructed of bamboos and clay. The palaces of the Mandarins, and the public buildings, which occupy large ſpaces of ground, are chiefly built with wood in a neat and ſolid manner, and decorated with ſculptures and paintings. The roofs conſiſt of tiles of different colours. The common houſes are compoſed of a roof placed on wooden columns, commonly covered with ſtraw, reeds, or large leaves of trees, which, accidents excepted, will laſt 30 or 40 years. Theſe houſes have no cielings or ſtories, but are divided by partitions, on a ground floor; and the numerous windows are covered with gauze, or fine muſlin, glaſs being almoſt unknown. This conſtruction being very liable to take fire, the police only permits it to be lighted during certain hours of the day. The trade is very conſiderable; and the great river is crowded with barks and boats, conveying the merchandize of the provinces to the capital. Each boat pays about two-pence for the right of anchorage, and this ſmall tax forms a conſiderable revenue. The royal palace occupies a conſiderable ſpace in the fineſt quarter of the city, ſituated amidſt groves, gardens, and canals, and difficult of acceſs. The women and eunuchs never quit its precincts. Before a recent revolution, the triple walls of the ancient city and palace, the courts paved with marble, and other features of grandeur, diſplayed one of the moſt beautiful and vaſt edifices of Aſia; for the circumference of the palace and gardens is ſaid to have been from ſix to ſeven French miles. At preſent the capital is only defended by a quick hedge of bamboos. In the neighbourhood is quartered a body of ſoldiery; the arſenal and other magazines of ammunition being on the banks of the river. On the other ſide is the Chineſe town, eſtabliſhed by precaution; nor are other ſtrangers allowed to enter the city without a ſpecial permiſſion. Abbé Richard cited in Pinkerton's Geography, vol. ii.

KESI, in *Hindoo Mythology*, a monſter ſlain by Viſhnu, or Kriſhna.

KESIRMAK, in *Geography*, a town of Poland, in the palatinate of Braclaw, near the Dneiſter; 72 miles S. of Braclaw.

KESITAH. This word is to be met with in Geneſis, and in Job; and is tranſlated in the Septuagint and Vulgate, ſheep or lambs. But the Rabbins and modern interpreters are generally of opinion, that Keſitah ſignifies rather a piece of money. Bochart and Eugubinus are of opinion the Septuagint meant *minæ*, and not *lambs*; in Greek *hecaton mnon*, εκατον μνων, inſtead of εκατον αμνων. Now a mina was worth ſixty Hebrew ſhekels, and conſequently ſix pounds ſixteen ſhillings and ten-pence halfpenny ſterling; or nine pounds Engliſh, ſuppoſing, as Dr. Prideaux does, that a ſhekel is worth three ſhillings. M. de Pelletier of Rouen is of opinion, that Keſitah was a Perſian coin, ſtamped on one ſide with an archer, (*Keſitah*, or *Keſeth*, in Hebrew ſignifying *a bow*,) and on the other with a lamb; that this was a gold coin known in the Eaſt by the name of a Daric, and was in value about twelve livres and ten-pence French money. A Daric is a piece of gold, worth, as Dr. Prideaux ſays, five and twenty ſhillings Engliſh. Several learned men, without mentioning the value of the Keſitah, ſay it was a ſilver coin, the impreſſion whereof was a ſheep; for which reaſon the Septuagint and Vulgate tranſlate it by this name. Calmet is of opinion, that Keſitah was a purſe of gold, or ſilver. In the Eaſt they reckon at preſent by purſes: a purſe in Perſia conſiſting of 50 tomans, which make 2518 penny

piece

pieces of French money. The word *kiſta* in Chaldee ſignifies a meaſure, or veſſel. And Euſtathius ſays that kiſta is a Perſian meaſure. Jonathan and the Targum of Jeruſalem tranſlate Keſitah, a pearl. Gen. xxxiii. 19. Job, xlii. 11. See his Connect. P. I. p. 101. See Calmet Comment. upon Gen. xxxiii. 19. Gen. xxv. 12. Job, xlii. 2, &c. and Dict. Bibl.

KESKER, or Kurab, in *Geography*, a town of Perſia, in the province of Ghilan, on the coaſt of the Caſpian ſea; 25 miles N.W. of Reſhd.

KESOCOTTY, a town of Thibet; 40 miles S. of Gangotri.

KESON, a town of Hindooſtan, in Lahore; 25 miles E.N.E. Jullindar.

KESSELDORF, a town of Saxony, in the margraviate of Meiſſen; ſeven miles W. of Dreſden.

KESTEN, a town of Syria; 25 miles W. of Aleppo.

KESTENUS, a town of Aſiatic Turkey, in Natolia; 20 miles S. of Amaſieh.

KESTREL, the Engliſh name of a hawk, called alſo the *ſtannel* and the *windhover*, and by authors the *tinnunculus* and *cencris*. It builds with us in hollow oaks, and feeds on partridges and other birds.

KESWICK, in *Geography*, a market town in the ward of Allerdale, in the county of Cumberland, England, is ſituated near the lower end of Derwentwater, on the eaſtern ſide of the extenſive and beautiful vale of Keſwick. The town conſiſts of one long ſtreet: the houſes are of ſtone, and were returned under the late population act at 290; the number of inhabitants 1350. A cotton factory has lately been eſtabliſhed here; coarſe woollen goods, carpets, blankets, kerſeys, and ſome linens are alſo manufactured in the town and its vicinity. The chief trade is derived from the influx of travellers viſiting the lakes: by whom Keſwick, from its central ſituation, is much frequented; the number in one ſeaſon, the ſummer of 1793, amounting to 1540 A weekly market is held on Saturdays; and a fair for cattle every fortnight from May to October. In this town two muſeums, collected by private perſons, are open for public inſpection; they contain ſpecimens of almoſt every variety of the mineralogical ſubſtances of Cumberland, with many kinds of foſſils, plants, antiques, and other curioſities. Keſwick is diſtant from London 291 miles.

About two miles to the ſouth of the town, on an eminence called Caſtle Rigg, is a Druidical arrangement of ſtones, ſome ſtanding upright, ſome fallen, and others leaning obliquely: the whole number is fifty; of which forty are diſpoſed in an oval form, thirty paces by thirty-two in diameter; the other ten compoſe a receſs or long ſquare within the area on the eaſt ſide, in conjunction with the ſtones of the oval; this is ſeven paces in length, and three in width. One ſtone is more than ſeven feet high, others exceed five feet; but the greater number are ſmaller. Weſt's Guide to the Lakes. Houſeman's Tour. Hutchinſon's Hiſtory, &c. of Cumberland. Beauties of England, vol. iii.

KET, William, in *Biography*, a tanner of Norfolk, who, in the regn of Edward VI. inſtigated a revolt againſt the government. The populace were at firſt excited by the complaints againſt incloſures, but finding their numbers increaſe, and already amounting to 20,000 ſtrong, they grew inſolent, and proceeded to more exorbitant pretenſions. They demanded the ſuppreſſion of the gentry; the placing of new counſellors about the king, and the re-eſtabliſhment of the Popiſh religion. Ket aſſumed the government over them, and exerciſed his brief authority with the utmoſt arrogance. Having taken poſſeſſion of Monſhold-hill, near Norwich, he erected his tribunal under the branches of an old ſpreading oak, thence denominated the Oak of Reformation, and ſummoning the gentry to appear before him, he gave ſuch decrees as might be expected from his character and ſituation. At length the earl of Warwick was ſent againſt the rebels, and put them to flight. Two thouſand fell, either in the action, or purſuit: Ket was taken and hanged at Norwich caſtle: nine of his followers ſuffered the like puniſhment on as many boughs of the Oak of Reformation, and the inſurrection was thus entirely ſuppreſſed in 1549. Hume.

KETAH, in *Geography*, a town of Hindooſtan, in Allahabad; 11 miles N. of Jionpour.

KETALEAH, a town of Hindooſtan, in Bahar; 74 miles S.S.W. of Patna. N. lat. 24° 38′. E. long. 84° 36′.

KETCH, in the *Marine*, is a veſſel with two maſts. The maſts are placed and rigged with ſails, as the main and mizen-maſts of a ſhip. Upon the bowſprit, and between that and the main-maſt, they have ſtayſails, and a very large jib. Formerly bomb-veſſels and yachts were thus rigged, as ketches, but of late years as ſhips. At preſent only a few coaſting veſſels are rigged ketch faſhion.

KETCHAR-TCHOU, in *Geography*, a town of Thibet; 10 miles S. of Giti.

KETCHENG-TASE Tartars, a tribe of Tartars who inhabit the territory of Chineſe Tartary, that lies on both the banks of the river Saghalien-Oula, and extends as far as the eaſtern ſea. Their country, which is almoſt 150 leagues in length, contains only ſmall villages, moſt of which are ſituated on the banks of the river. The language of theſe Tartars is different from that of the Mantchews, and is diſtinguiſhed by the name of "Fiatta." It is probably the ſame which is ſpoken by the other more northerly Tartars, who live beyond the mouth of the river Saghalien.

The Tartars of Ketcheng-taſe do not ſhave their heads, as other people of the empire. They wear their hair tied in a knot with a ribband, or encloſed in a bag behind. They appear to be leſs clowniſh than the Yupi-taſe Tartars. They employ much of their time in hunting ſables, and are obliged to pay a certain number of their ſkins in tribute.

KETCHICTEN, or Kesicten, a country of Chineſe Tartary, divided into two ſtandards. N. lat. 43°. E. long. 117° 38′.

KETEMBER, a ſmall iſland in the Eaſt Indian ſea, S. lat. 6° 12′. E. long. 132° 53′.

KETMEBEH, a town of Natolia; 27 miles E. of Pergamo.

KETMIA, in *Botany*, the Syrian appellation of the ſhrub commonly called *Althæa frutex*, *Hibiſcus ſyriacus* of Linnæus. Tournefort, in his *Inſtitutiones*, 99, t. 26, adopts it for the whole genus of *Hibiſcus*; ſee that article. Some ſpecies of *Bombax* and *Hermannia* have alſo occaſionally been called by this name.

KETOI, in *Geography*, one of the Kurile or Kurilſkoi iſlands, in the N. Pacific ocean. This iſland is 30 verſts in length, and about 10 in breadth. On it are ſeen high mountains, with their white rocky walls and ſummits: at the foot of theſe, and in the vallies, are foreſts of birch, alder, the ſorbus ſylveſtris aucuparia, and ſeveral ſpecies of pines. The iſland nouriſhes white, black-bellied, and red foxes. The ſea animals are not plentiful. It is uninhabited. N. lat. 48° 45′. E. long. 153° 38′.

KETRAN, Kitran, or *Alketran*, a name given by ſome of the Arabian authors to the oil of cedar, called by the Greeks *cedria*. We have of later times formed the word *cedranum* upon this, and it has ſince been applied to the zopiſſa of the ancients, a compound made of pitch and wax melted together, and uſed for covering the bottom of ſhips.

KETSIO, in *Geography*, a town of Sweden, in the province of Smaland; 40 miles N.W. of Wexio.

KETSKOI, a town of Ruſſia, in the government of Tobolſk, ſeated on the river Ket, which runs into the Oby at Narim; 64 miles S.E. of Narim.

KETSKEMET, a town of Hungary; 92 miles E. of Caniſcha.

KETTERING is a populous market-town, ſituated on an eaſy aſcent, in the hundred of Huxloe, Northamptonſhire, England. In the time of the Saxons, it was called Cytringan and Kateringes: the lordſhip was granted by king Edwy, in the year 976, to his ſervant Elfſige. The church, which compriſes a nave, north and ſouth aiſles, and a chancel, has a handſome tower and ſpire at the weſt end. The tower conſiſts of three ſtories, in each of which are large windows, or window frames, of ſeveral compartments: the angles are flanked with double buttreſſes: under the embattled parapet runs an ornamented faſcia, and at each corner is raiſed a ſmall hexangular embattled turret; the whole ſurmounted by a handſome hexagonal crocketted ſpire, with three windows, diminiſhing in their ſize upwards, on the alternate ſides. The following quaint prophetic promiſe is inſcribed in this church: "Who ſo redis mi name ſhal have Godys blyſſing and our lady; and my wyſis doo ſey the ſame." Excepting the church, Kettering has nothing to attract or intereſt the antiquary. Near the middle of the town is a ſpacious area, ſurrounded by ſome private houſes and ſhops of reſpectable appearance. Here are a ſeſſions-houſe, and a well endowed free-ſchool; alſo an alms-houſe for ſix poor widows, and two diſſenting meetings. By the returns made to parliament in 1801, the number of houſes appears to be 641; of inhabitants, 3011; of which number 1770 were reported as employed in various trades and manufactures, and 221 in agriculture. The chief manufactures are thoſe of lace-working, wool-combing, and the ſpinning and weaving of tammies and laſtings. Kettering is 16 miles diſtant from Northampton, and 74 from London; has a well ſupplied weekly market on Fridays, and four annual fairs.

Kettering was the birth-place of Dr. John Gill, a diſſenting miniſter of diſtinguiſhed eminence, through the greater part of the laſt century. He was one of thoſe ſelf-taught ſons of genius, who, by overcoming what are too often conſidered inſurmountable obſtacles in literature, aſtoniſhed the world by the variety and extent of their acquiſitions. See Gill, John.

In the vicinity of this town, to the weſtward, in a road called Staunch Lane, are found what are denominated *kit-cats*, a kind of pellucid ſtones, apparently vitrifications. Theſe, when pulverized, are conſidered ſingularly efficacious as a ſtyptic, and are conſequently much eſteemed. They are frequently diſcovered near the ſurface of the ground, but more uſually in the argillaceous ſtrata, dug for making brick. In a ſpot, named Stony-lands, between Kettering and Weekly woods, in quarrying for ſtones, were found urns, bones, coins, and other antiquities. Bridge's Hiſtory of Northamptonſhire. Beauties of England, vol. xi.

KETTLE Falls, a cataract on the river Utwas, in Canada; 90 miles W. of Montreal.

Kettle *River*, a river of Canada, which runs into lake Erie, N. lat. 43°. W. long. 80° 51′. See Chaudiere.

Kettle, in the *Art of War*, a term the Dutch give to a battery of mortars, becauſe it is ſunk under ground.

Kettle-*Drums*. See Drum.

The kettle-drum, with trumpets, is the moſt martial ſound of any; each regiment of horſe formerly had a pair.

The kettle-drummer rides always at the head of the ſquadron, and his poſt is on the right when the ſquadron is drawn up.

The kettle-drum, belonging to the royal regiment of artillery, is mounted on a ſuperb waggon, richly gilt and ornamented, and drawn by four white horſes, elegantly capariſoned, with a ſeat for the drum-major general.

KETTLEWELL, John, in *Biography*, was born at North-Allerton, in the county of York, in the year 1653. Here he received the elements of a learned education, and in 1670 was entered a ſervitor at St. Edmund Hall, in the univerſity of Oxford. Having taken the degree of B.A. he was choſen a fellow of Lincoln-college, and became eminent as a tutor in that ſociety. He took the degree of M.A. in 1677, entered holy orders, and became celebrated for his uſeful and inſtructive mode of preaching, and alſo for his great theological knowledge. In the year 1681, he publiſhed "Meaſures of Chriſtian Obedience, &c. for the Promotion of the Piety and Peace of troubled Conſciences," which procured the author a high degree of reputation as a practical and controverſial writer. It was dedicated to Dr. Compton, biſhop of London, but when that prelate took an active part in the meaſures that terminated in the abdication of James II. Mr. Kettlewell ordered the dedication to be eraſed from all the copies of the work which were unſold, and directed it to be omitted in future editions. The work itſelf induced the counteſs of Bedford to appoint him one of her domeſtic chaplains, and it procured for him the patronage of lord Digby, who, in 1682, preſented him with the living of Coleſhill, in Warwickſhire. On this living he continued to diſcharge the duties of the paſtoral office, much eſteemed and reſpected, till the year 1690, when he was deprived for refuſing to take the oaths of ſupremacy to king William and queen Mary. After his deprivation he removed to London, where he chiefly aſſociated with gentlemen, who entertained ſimilar ſentiments with thoſe which he himſelf avowed. In conjunction with Mr. Robert Nelſon he concerted "a model of a fund of charity for the needy ſuffering, that is, the nonjuring clergy." He died of a conſumption in 1695, when in the 42d year of his age. "He was," ſays his friend, "learned without pride, wiſe and judicious without cunning: he ſerved at the altar without either covetouſneſs or ambition: he was devout without affectation: ſincerely religious without moroſeneſs: courteous and affable without flattery, or mean compliances: juſt without rigour: charitable without vanity, and heartily zealous for the intereſt of religion without faction." His works, which are numerous, were publiſhed in 1718, in two vols. folio. Biog. Brit.

KETU, in *Hindoo Mythology*, is the regent of the deſcending node, or the dragon's tail. The following legend on this ſubject is from Moor's Hindoo Pantheon, p. 282. "Rahu was the ſon of Kaſyapa and Diti (ſee Kasyapa), according to ſome authorities; but others repreſent Sinhika (perhaps the Sphinx) as his natural mother. He had four arms; his lower parts ended in a tail, like that of a dragon, and his aſpect was grim and gloomy, like the *darkneſs* of the chaos, whence he had alſo the name of Tamaſa. He was the adviſer of all miſchief among the Daityas, or evil ſpirits, and his chief delight was to ſow diſſention among the Devatas, or beneficent deities. When the gods had produced the Amrita, or elixir of immortality, by churning the ocean (ſee Kurmavatara), he diſguiſed himſelf like one of them, and received a portion of it; but the Sun and Moon diſcovering the fraud, Viſhnu ſevered his head and two of his arms from the reſt of his monſtrous body. That part of the nectareous fluid, that he had time to ſwallow, ſecured his immortality; his trunk and dragon-like tail fell on the mountains of Malaya, where Mini, or Brahman, carefully preſerved them by the name of Ketu; and, as if a complete body had been formed from them, like a diſmembered polype, he is ſaid to have adopted Ketu as his own child. The head, with two arms, fell on the ſands of Barbara, where Pithenas was then walking with his wife Sinhika: they carried the Daitya to their palace, and adopted him as their ſon. This extravagant tale is no doubt aſtronomical; Rahu and Ketu being the *nodes*, or what aſtrologers call the head and tail of the dragon. It is added, that they appeaſed Viſhnu, and obtained re-admiſſion to the firmament, but were no longer viſible from the earth, their enlightened ſides being turned from it; that Rahu ſtrives, during eclipſes, to wreak vengeance on the Sun and Moon who detected him; and that Ketu often appears as a comet, a whirlwind, a fiery meteor, or water-ſpout, or a column of ſand. Fifty-ſix comets are ſaid, in a book called Chintamani, to have ſprung from Ketu; and Rahu had a numerous progeny of Grahas, or crocodiles." A plate of the Hindoo zodiac includes Rahu and Ketu, the latter appearing merely as a head of a black colour, handſomely ornamented, and reſting againſt a pillow. In a plate of the Indian zodiac, publiſhed by ſir W. Jones in the ſecond volume of the Aſiatic Reſearches, Ketu is mounted on a frog; the meaning of which, if it have any, has not been explained. See Rahu.

KETVER, in *Geography*, a town of Grand Bucharia, on a mountain, taken by Timur Bec in 1398; 100 miles S. of Badakſhan.

KETZIN, a town of Brandenburg, in the Middle Mark; 8 miles N.W. of Potzdam.

KETZLDORF, a town of Bohemia, in the circle of Chrudim; 12 miles S.E. of Leutiniſchl.

KEVALCOTTY, a town of Thibet; 18 miles N.W. of Sirinagur.

KEVEL of Buffon, in *Zoology*, *Antilope Kevella* of Linnæus, *Ahy* of Kæmpfer, and *flat-horned antelope* of Pennant, has large horns, which are flattened, and bent in form of a lyre; the fur is yellowiſh, with pale ſtreaks, and a dark coloured band runs along each ſide. This animal inhabits Barbary, Senegal, and Perſia. It is about the ſize of a ſmall roe; lives in large flocks, and, like moſt ſpecies of the genus, is reckoned very delicate food, though it has a muſky odour when alive. In both ſexes the horns are ſurrounded with prominent rings, uſually from 14 to 18, except the ends, which are ſmooth: they are bent in the ſame manner with thoſe of the antilope dorcas, and in general the two animals reſemble each other very much, except that the horns of this ſpecies are flattened, and have a greater number of rings.

KEVELS, or Chevils, in a *Ship*, are two pieces of timber nailed to the inſide of a ſhip, from whence the upper ends branch outward into arms or horns, ſerving to belay the great ropes, by which the bottoms of the mainſail and foreſail are extended.

KEUKZER, in *Geography*, a town of Perſia, in Farſiſtan; 40 miles S. of Jezdkaſt.

KEULA, a town of Germany, in the county of Schwartzburg; 11 miles N. of Mulhauſen.

KEURA, in *Botany*, Forſk. Ægypt. Arab. 172. Thunb. Nov. Gen. 35. See Kaida and Pandanus.

KEURBOOM River, in *Geography*, a river on the S. coaſt of the colony of the Cape of Good Hope, which, like the Knyſna, runs up into the midſt of tall foreſts, and might be navigated by boats to a conſiderable diſtance; but its mouth, in Plettenberg's bay, is completely ſanded up by the almoſt perpetual rolling ſwell of the ſea, from the ſouth-eaſtward upon the ſandy beach.

KEURN, a town of Sweden, in the government of Waſa; 96 miles S.E. of Waſa.

KEVROL, a town of Ruſſia, in the government of Archangel; 100 miles S.E. of Archangel.

KEUSCHBERG, or Kiade, a town of Saxony, remarkable for a victory obtained by Henry the Fowler over the Huns, in 933; 6 miles S.E. of Merſeburg.

KEW, a village and pariſh in the hundred of Kingſton, and county of Surry, England, is pleaſantly ſeated on the ſouthern banks of the river Thames, at the diſtance of 6½ miles weſtward of London. In the year 1800 it contained 85 houſes, and 424 inhabitants. Previous to the year 1769, this place was only a hamlet to Kingſton, but in that year an act of parliament was obtained to unite this and Peterſham in one vicarage. The neighbouring inhabitants then ſubſcribed to build a chapel on a piece of land given by queen Anne. In this is a tablet to the memory of Jeremiah Meyer, a celebrated miniature painter; and in the adjoining cemetery repoſe the remains of Thomas Gainſborough, an artiſt of diſtinguiſhed merit. (See Gainsborough.) Over the Thames, at this place, is a handſome ſtone bridge of ſeven arches, built from a deſign by Paine. It was opened in 1789, and is private property; to defray the expences of which a toll is exacted from all perſons, carriages, horſes, &c. paſſing over it. In this village is one of the royal palaces, which is held on leaſe. It is a ſmall houſe, in a bad ſtyle of architecture, and in a flat, confined ſituation; yet, from its contiguity to the fine and intereſting gardens of Kew, has continued a royal reſidence for many years. His preſent majeſty, George III. has commenced a new palace upon a larger ſcale; but the works have been long ſuſpended, and it is not improbable that both theſe ſtructures may be utterly deſerted by the next monarch. It is built from deſigns of James Wyatt, eſq. The gardens of Kew are the pride and ornament of the place. They are compriſed in 120 acres of land, and are planted with almoſt every ſpecies of exotic tree, ſhrub, and plant that can be preſerved alive in this country. Sir William Chambers publiſhed a particular account of theſe gardens, and of the various ornamental buildings within them; but ſince ſir William's deceaſe many additions and improvements have been made to the exotic garden. The late Mr. Aiton, gardener, gave ſome account of the rare plants, &c. cultivated here, in a work, entitled "Hortus Kewenſis." The following are the names and dates of the different buildings erected by ſir William Chambers within theſe gardens: The Orangery, or Greenhouſe, built in 1761, is 145 feet long, 30 feet wide, and 25 feet high. In the ſame year, and near the ſame building, was erected "The Temple of the Sun," partly reſembling one of the temples of Balbec. In the Flower Garden is an "Aviary," and near it a "Menagerie," with a pavilion deſigned in imitation of a Chineſe opening. Contiguous to this ſtands "The Temple of Bellona," built in 1760, of the proſtyle kind, with portico tetraſtyle Doric. In a ſolitary walk, near the lake, is "The Temple of the God Pan," of the monopterous kind, of the Doric order, built in 1758. On an eminence ſtands "The Temple of Eolus," of ſimilar figure with the preceding. Not far from this, at the head of the lake, is a Chineſe octagon, of two ſtories, called "The Houſe of Confucius," built from deſigns by Goupy. Paſſing hence through a winding ſhady walk, the ſtranger is next conducted to a Corinthian colonnade, called "The Theatre of Auguſta," built in 1760. "The

Temple of Victory" is the next object, executed in 1759, in commemoration of a victory obtained by prince Ferdinand of Brunſwick, in that year. The Alhandra is imitative of a moreſque building; and the great Pagoda is built in imitation of the Chineſe Taa. The baſe is a regular octagon of 49 feet in diameter, and the elevation is compoſed of 10 priſms, or 10 ſtories, and is 163 feet in height. The other buildings are called the Moſque, the Gallery of Antiques, the Temple of Arethuſa, and the Ruin. The Gardens at Kew are opened every Monday during the ſummer. Lyſons's Environs of London.

KEWAN, a town of Hindooſtan, in the circar of Kitchwara; 10 miles W. of Sheergur.

KEWEH, a town of Natolia, on the Sakaria; 24 miles E. of Iſnik.

KEXHOLM, a town of Ruſſia, in the government of Viborg, built on two iſlands at the mouth of a river, on the ſide of lake Ladoga. The houſes are conſtructed of wood, but the town is well fortified, and defended by a citadel; 40 miles E.N.E. of Viborg. N. lat. 61°. E. long. 29° 50′.

KEXLEBODA, a town of Sweden, in the province of Smaland; 36 miles S.S.W. of Wexio.

KEY, Great, a ſmall iſland in the Eaſt Indian ſea, about 50 miles long, and from 5 to 12 broad. S. lat. 5° 24′. E. long. 133° 28′.

Key, *Little*, an iſland in the Eaſt Indian ſea, about 60 miles in circumference. S. lat. 5° 52′. E. long. 133° 12′.

Key, a little iron inſtrument for the opening of locks.

L. Molinus has a treatiſe of keys, "De Clavibus Veterum," printed at Upſal. He derives the Latin name *clavis* from the Greek κλειω, *claudo, I ſhut;* or from the adverb *clam, privately;* and adds that the uſe of keys is yet unknown in ſome parts of Sweden.

The invention of keys is owing to one Theodore of Samos, according to Pliny and Polydore Virgil; but this muſt be a miſtake, the uſe of keys having been known before the ſiege of Troy: mention even ſeems to be made of them in the nineteenth chapter of Geneſis.

Molinus is of opinion, that keys, at firſt, only ſerved for the untying certain knots, wherewith they anciently ſecured their doors; but the Laconic keys, he maintains, were nearly akin in uſe to our own: they conſiſted of three ſingle teeth, and made the figure of an E; of which form there are ſtill ſome to be ſeen in the cabinets of the curious.

There was alſo another key, called βαλαναγρα, made in the manner of a male ſcrew, which had its correſponding female in a bolt affixed to the door.

Key is hence become a general name for ſeveral things ſerving to ſhut up or cloſe others.

Key, or *Key-ſtone, of an Arch, or Vault,* is the laſt ſtone placed atop thereof; which, being wider and fuller at the top than the bottom, wedges as it were, and binds in all the reſt.

The key is different in the different orders; in the Tuſcan and Doric, it is a plain ſtone, only projecting; in the Ionic, it is cut, and waved ſomewhat after the manner of conſoles; in the Corinthian and Compoſite, it is a conſole enriched with ſculpture, foliages, &c.

M. Belidor makes the thickneſs of the arch-ſtones of a bridge, one twenty-fourth part of the width of the arch; but Mr. Gautier, another experienced engineer, makes their length, in an arch twenty-four feet wide, two feet; in arches, forty-five, ſixty, ſeventy-five, ninety wide, three, four, five, ſix feet, reſpectively: and it is obſerved by Mr. Muller, that the thickneſs allowed by Belidor is not ſufficient to prevent the weight of the arches from cruſhing the key-ſtones to pieces by their preſſure againſt one another. Muller's Pract. Fortif. p. 253.

The name key-ſtones, or arch-ſtones, is ſometimes alſo given to all the ſtones which form the ſweep of an arch, or vault, anſwering to what the French more diſtinctly call *vouſſoirs.*

Key is alſo uſed for the eccleſiaſtical juriſdiction; particularly for the power of excommunicating, and abſolving. The Romaniſts ſay, the pope has the power of the keys, and can open and ſhut paradiſe as he pleaſes; grounding their opinion on that expreſſion of Jeſus Chriſt, "I will give thee the keys of the kingdom of heaven."

In St. Gregory we read, that it was the cuſtom heretofore, for the popes to ſend a golden key to princes, wherein they always encloſed a little of the filings of St. Peter's chains, kept with great devotion at Rome; and that theſe keys were worn in the boſom, as being ſuppoſed to contain ſome wonderful virtues.

Key, in *Muſic,* is a certain fundamental ſound, or tone, to which the whole piece, be it concerto, ſonata, cantata, &c. is accommodated; and with which it uſually begins, but always ends.

To get an idea of the uſe of the key, it may be obſerved, that as in an oration there is a ſubject, *viz.* ſome principal perſon or thing, to which the diſcourſe is referred, and which is always to be kept in view, that nothing unnatural and foreign to the ſubject may be brought in; ſo in every regular piece of muſic, there is one note, *viz.* the key, which regulates all the reſt. The piece begins and ends in this; and this is, as it were, the muſical ſubject, to which a regard muſt be had in all the other ſounds of the piece. Again, as in an oration there are ſeveral diſtinct articles, which refer to different ſubjects, yet ſo as they have all a viſible connection with the principal ſubject, which regulates and influences the whole; ſo in muſic there may be various ſubaltern ſubjects, that is, various keys, to which the different parts of the piece may belong: but then, they muſt be all under the influence of the firſt and principal key, and have a ſenſible connection with it.

To give a more diſtinct notion of the key, we muſt obſerve, that the octave contains in it the whole principles of muſic, both with reſpect to conſonance or harmony, and ſucceſſion or melody; and if either ſcale be continued to a double octave, there will, in that caſe, be ſeven different orders of the degrees of an octave, proceeding from the ſeven different letters, with which the terms of the ſcale are marked. Any given ſound, therefore, *i. e.* a ſound of any determinate pitch or tune, may be made the key of the piece, by applying it to the ſeven natural ſounds ariſing from the diviſion of an octave, and repeating the octave above or below, at pleaſure. The given ſound is applied as the principal note or key of the piece, by making frequent cloſes or cadences upon it; and, in the progreſs of the melody, no other but thoſe ſeven natural ſounds can be admitted, while the piece continues in that key, every other ſound being foreign to the fundamental, or key.

For inſtance, ſuppoſe a ſong begun in any ſound, and carried on upwards, or downwards, by degrees and harmonical diſtances, ſo as never to touch any ſounds, but what are referrible to that firſt ſound as a fundamental, *i. e.* are the true ſounds of the natural ſcale proceeding from the fundamental; and let the melody be ſo conducted through thoſe natural ſounds, as to cloſe and terminate in the fundamental, or any of its octaves above or below; that ſound is called the key of the melody, becauſe it governs all the reſt, limiting them ſo far, as that they muſt be to it, in the relation to the ſeven eſſential ſounds of an octave ; and when any other ſound is brought in, it is called *going out of the key*.

From which way of ſpeaking, *viz.* a ſong's continuing in, or going out of the key, it may be obſerved, that the whole octave, with its natural ſounds, come under the idea of a key ; though the fundamental or principal ſound is, in a peculiar ſenſe, called the key.

In which laſt ſenſe of the word key, (*viz.* where it is applied to one fundamental ſound,) another ſound is ſaid to be out of the key, when it has not the relation to that fundamental of any of the natural ſounds belonging to the concinnous diviſion of the octave.

Here too it muſt be added, with reſpect to the two different diviſions of the octave, that a ſound may belong to the ſame key, *i. e.* it may have a juſt muſical relation to the ſame fundamental in one kind of diviſion, and be out of the key with reſpect to another.

Now a piece of muſic may be carried through ſeveral keys ; *i. e.* it may be given in one key, and be led out of that into another, by introducing ſome ſound foreign to the firſt, and ſo on to another : but a regular piece muſt not only return to the firſt key, but thoſe other keys too, muſt have a particular connection with the firſt. It may be added, that thoſe other keys muſt be ſome of the natural ſounds of the principal key, though not any of them at pleaſure.

As to the diſtinctions of keys, we have already obſerved, that to conſtitute any given note or ſound, a key, or fundamental ſound, it muſt have the ſeven eſſential or natural notes added to it ; out of which, or their octaves, all the notes of the piece muſt be taken, while it keeps within the key, *i. e.* within the government of that fundamental. It is evident, therefore, there are but two different ſpecies of keys, which ariſe according as we join the greater or leſs third, theſe being always accompanied with the ſixth or ſeventh of the ſame ſpecies ; the third *g*, for inſtance, with the ſixth or ſeventh *g*, and the third *l* with the ſixth and ſeventh *l*.

This diſtinction is expreſſed under the names of *ſharp* key, which is that with the third *g*, &c. and the *flat* key, which is that with the third *l*, &c. : whence it is plain, that how many different cloſes ſoever there be in a piece, there can be but two keys, if we conſider the eſſential difference of keys ; every key being either flat or ſharp, and every ſharp key being the ſame, as to melody, as well as every flat one.

It muſt be obſerved, however, that in common practice the keys are ſaid to be different, when nothing is conſidered but the different tone, or pitch of the ſound, in which the different cloſes are made. In this ſenſe, the ſame piece is ſaid to be in different keys, according as it is begun in different ſounds, or degrees of tune.

To prevent any confuſion which might ariſe from uſing the ſame word in different ſenſes, Mr. Malcolm propoſes the word *mode* to be ſubſtituted inſtead of the word key, in the former ſenſe ; that is, where it expreſſes the melodious conſtitution of the octave, as it conſiſts of ſeven eſſential and natural ſounds, beſides the fundamental ; and in regard there are two ſpecies of it, he propoſes, that that with a third *g* be called the *greater mode ;* and that with a third *l*, the *leſſer mode :* appropriating the word key to thoſe ſounds of the piece in which the cadence is made ; all of which may be called *different* keys, in reſpect of their different degrees of tune.

To diſtinguiſh then accurately between a *mode* and a key, he gives us this definition ; *viz.* an octave, with all its natural and eſſential degrees, is a mode, with reſpect to the conſtitution, or manner of dividing it ; but with reſpect to its place in the ſcale of muſic, *i. e.* the degree or pitch of tune, it is a key ; though that name is peculiarly applied to the fundamental.

Whence it follows that the ſame mode may be with different keys ; *i. e.* an octave of ſounds may be raiſed in the ſame order, and kind of degrees, which makes the ſame mode, and yet be begun higher or lower ; *i. e.* be taken at different degrees of tune, with reſpect to the whole, which makes different keys ; and *vice verſâ*, that the ſame key may be with different modes, *i. e.* the extremes of two octaves may be in the ſame degree of tune, yet the diviſion of them be different.

Keys alſo imply thoſe little levers in the fore-part of an organ, harpſichord, or piano-forte, by means of which wind is given to the pipes, and the jacks or hammers ſtrike the ſtrings of the inſtrument.

In large organs there are generally three ſets of keys ; one for the great or full organ, one for the choir organ, and one for the ſwell and echoes. The long keys uſed to be black, and the ſhort, or flats and ſharps, white ; but a contrary practice took place about the beginning of the laſt century.

Keys, in *Sea Language*, a name given to certain rocks lying near the ſurface of the water, particularly in the Weſt Indies.

Key, a dry piece of tapering oak, driven into ſcarfs to ſet them cloſe.

Key, in a *Naval Senſe.* See Kay.

Key, in *Polygraphy*, and *Steganography*, denotes the alphabet of a cipher ; which is a ſecret known only to the perſon who writes the letter, and him who deciphers it. See Alphabet and Cipher.

Some ciphers have a ſingle key, where the ſame characters are uſed throughout ; in other ciphers, the characters are varied, and the key is doubled.

Keys, a denomination given to the ſeeds of the aſh.

Key-*Lough*, in *Geography*, a lake of Ireland, in the northern part of the county of Roſcommon, near the town of Boyle. The river Boyle flows through this lake, which is a beautiful piece of water, interſperſed with ſeveral iſlands, ſome of them well wooded, and others highly cultivated. It is ſometimes called Kingſton lough.

KEYNSHAM, a market town and pariſh in the hundred of Keynſham, and county of Somerſet, England, is five miles eaſt of Briſtol, and ſeven weſt of Bath, on the great public road between thoſe cities. In the year 1800, the town conſiſted of 286 houſes, and contained 1591 inhabitants. Here was formerly a conſiderable woollen manufactory, but at preſent the ſtaple trade of the town is malting. An abbey was founded here, in 1170, by William earl of Glouceſter ; and at the diſſolution was granted to Thomas Bridges, ſome of whoſe deſcendants ſtill have an intereſt in the lands annexed to it. The ſub-ſtratum of the county is an immenſe rock ; in which are imbedded vaſt numbers of the cornu-ammonis, or ſnake ſtones. Many of theſe are very large, and by the common people are believed to have originated from ſome miraculous power. The church is a large building. Here are a weekly market, and two annual fairs. Collinſon's Hiſtory, &c. of Somerſetſhire, 3 vols. 4to.

KEYSLER, John George, in *Biography*, a celebrated traveller, was born at Thurnau, in the county of Giech, in the year 1683. He received a good education, and manifeſted, at an early period, a ſtrong attachment to the ſciences. At a proper time, and having laid in a good ſtock of elementary knowledge, he was entered at the univerſity of Halle, where he ſtudied juriſprudence, without neglecting the

the other branches of academical inſtruction. When he had finiſhed his ſtudies, he was invited to ſuperintend the education of Charles Maximilian, and Chriſtian Charles, counts of Giech-Buchau, with whom he repaired to Halle in 1717, and then accompanied them on their travels in foreign countries. In his journey he met with the celebrated Roland, who recommended to his attention the immenſe field of German antiquities, as yet almoſt untouched: he accordingly caught at the idea, and formed the reſolution of undertaking ſomething ſyſtematic on the antiquities of Germany, and the origin of its inhabitants. He went through the principal towns in Germany and the Low Countries, collecting, as they occurred, materials for his intended work. In conſequence of the great reputation which he acquired in his firſt tour, M. Bernſtorff, miniſter of his Britannic majeſty in Hanover, an enlightened ſtateſman, engaged him as a travelling tutor to his ſons. After remaining two years in Hanover, he obtained permiſſion, in 1718, to viſit England for his own improvement. At London and Oxford he met with a kind reception, but nothing, probably, pleaſed him more, than the honour of being elected a member of the Royal Society. He wrote ſome tracts at this period, one containing ſeveral curious obſervations on Stonehenge, and a diſſertation on the conſecrated miſletoe of the Druids; and on his return to Hanover in 1720, he publiſhed his immortal work, entitled "Antiquitates ſelectæ Septentrionales et Celticæ," in which the author is exceedingly happy in ſolving a great number of difficulties never before ſufficiently explained. In 1727, Keyſler's pupils, who continued under his care more than ten years, accompanied him to Tubingen, and, in 1729, they began their travels, which compriſed the whole of Germany, Swiſſerland, Italy, Hungary, France, England, and Holland. On their return ample proviſion was made for the tutor, and they entruſted him, at the ſame time, with a valuable library, their collection of medals and natural curioſities, and even gave him the chief management of their domeſtic concerns. M. Keyſler, in the courſe of his travels, had made a valuable collection of books, antiques, &c., to which he added, by purchaſe, that of M. Eckard, and to prevent the whole from being diſperſed, he deſtined it after his death to be added to that of M. Bernſtorff. He was of an open and communicative diſpoſition, and ready to aſſiſt in their literary labours, all thoſe who ſtood in need of his advice. He rendered M. Eckard great ſervice when about to publiſh his German Antiquities, after the model of the "Theſaurus Antiquitatum Græcarum et Romanarum," by Grævius and Gronovius. This work was never printed. In 1728, when M. Jark reprinted the work of Schedius, on the German deities, Keyſler not only corrected it, but furniſhed him with conſiderable additions, and ſubjoined an ingenious diſſertation "De cultu Solis." He died ſuddenly, in June 1743, at Stentenbourg, an eſtate belonging to M. Bernſtorff. His travels were tranſlated into the Engliſh language from the ſecond edition in German, and publiſhed in four vols. 4to. Gen. Biog.

KEYSERSTUL, in *Geography*, a town of Switzerland, in the county of Baden, on the river Rhine, with a wooden bridge to Schaffhauſen; 9 miles N.N.E. of Baden. N. lat. 47° 37′. E. long. 8° 15′.

KEY-SIMA, an iſland of Japan, between Corea and the W. coaſt of Niphon.

KEY-WALE'LA, an iſland in the Eaſt Indian ſea, about 45 miles in circumference. S. lat. 5° 36′. E. long. 138°.

KEYWAWA, a ſmall iſland near Charleſton harbour, South Carolina.

KEYZER'S BAY, a bay on the S. coaſt of the iſland of Sumatra. N. lat. 5° 40′. E. long. 104° 38′.

KEZEMSKA, a town of Ruſſia, in the government of Irkutſk, on the Angara; 40 miles S.W. of Ilimſk.

KEZEREH, a town of Natolia; 40 miles E. of Caſtamena.

KEZIL, a river of Perſia, which runs into the Caſpian ſea, near Reſhd.

KEZIL, *Kheſil*, or *Khezil*, a river of Aſia, which riſes in the mountains of Bucharia, N.E. of Samarcand, and formerly ran into the Caſpian ſea; but the Ruſſians, in 1719, endeavouring to trace the ſtream, were put to death by the Tartars, who turned the current of the river into lake Aral, by uniting it with the Gihon: but this change of the courſe of the Gihon has been diſputed. See OXUS. See alſo KHARASM.

KEZIL-*Agaſh*, a town of Perſia, in the province of Ghilan; 20 miles N. of Lenkeran.

KEZIL-*Kaja*, a town of Natolia; 25 miles S. of Iſbarteh.

KEZIN, a town of Poland, in Volhynia; 10 miles W. of Krzeminiec.

KEZMA, a town of Ruſſia, in the government of Irkutſk, on the Tunguſka; 160 miles N.N.W. of Ilimſk.

KEZUC, a town of Perſian Armenia; 4 miles S. of Erivan.

KHABUR, a river of Aſiatic Turkey, which riſes 20 miles E. of Harran, and runs into the Euphrates at Kerkiſia.—Alſo, a river of Curdiſtan, which paſſes by Beths and runs into the Tigris; 15 miles S.E. of Gezira.

KHADARAH, EL, or CHADRA, a town of Algiers, in the province of Tremecen, ſeated on an eminence near the river Shelliff. Dr. Shaw concludes from its ruins, which are about three miles in circumference, that it was once a large place. According to Ptolemy, its ancient name was "Zucchabbari," and according to Pliny "Succabar" and "Colonia Auguſta." Eaſtward are the remains of a ſtone bridge, probably the only one ever built over the Shelliff, though travellers are much inconvenienced, in the winter ſeaſon, by waiting a whole month before they can ford it; 55 miles S.S.W. of Algiers.

KHALEKAN, EBN, in *Biography*, a celebrated biographer of illuſtrious Muſſulmen, particularly of ſuch as were diſtinguiſhed by their proficiency in the ſciences, was born in the year 608, and died in 681 of the Hegira. His work is entitled "Vafiat Alaian," or "The Deaths of illuſtrious Men," and was undertaken by him at the city of Cairo, in Egypt, under the reign of Bibars, a ſultan of the Mameluke dynaſty. Being appointed by that prince cadi of Damaſcus in the year 659, the duties of his new employment ſo far interrupted his ſtudies, that he was not able to finiſh his work before the year 672.

KHAMI, in *Geography*. See HAMI.

KHAMIES BERG, a cluſter of mountains belonging to the colony of the Cape of Good Hope, ſituated in the middle of the country, that was formerly inhabited by the Namaaqua Hottentots, at the diſtance of five days' journey N.W. from the *Hantam*, (which ſee,) over a dry ſandy deſert almoſt deſtitute of water. This cluſter of mountains being the beſt, and indeed almoſt the only habitable part in the Namaaqua country, has been taken poſſeſſion of by the wandering peaſantry, who, to the advantage of a good grazing country, had the additional inducement of ſettling there, from the eaſy means of increaſing their ſtock of ſheep from the herds of the native Hottentots, who, however, are now ſo reduced and ſcattered among the Dutch farms, as ſcarcely to be conſidered a diſtinct tribe of people. The copper mountains commence where the Khamies-berg ends, the whole ſurface of which is ſaid to be covered with malachite, or the carbonate of copper, and cupreous pyrites. But the ores of theſe mountains, though abundant and rich, are of no great value on account of the total want of every kind of fuel to ſmelt them, as well as of their very great diſtance from the Cape, and from there being neither bay nor river, where they could be put on board of coaſting veſſels. In the Khamies-berg is alſo found, in large blocks, that beautiful ſpecies of ſtone, to which mineralogiſts have given the name of Prehnite.

KHAMIR. See Chamir.

KHAN, or Kan, the name of an officer in Perſia, anſwering to that of *governor* in Europe. There are khans of provinces, countries, and cities, who have different additions to diſtinguiſh them. In the language of the north of Aſia, this title expreſſes the full extent of the regal dignity.

KHANAKA, a town of Kharaſm, on the Gihon; 250 miles S.W. of Samarcand.

KHANGA, El, a town of Egypt, formerly enriched by the caravans which paſſed from Cairo to Syria, and containing about 1000 inhabitants; 12 miles N.E. of Cairo.

KHANUDUM, a large lake of Perſia, in the province of Adirbeitzan, 60 miles long and 30 broad; called alſo the lake of Urmia; 30 miles S.W. of Tabris.

KHARA, a malignant being, according to Indian legends, who commanded a legion of 14,000 demons, like himſelf, in the wars of Lanka, as Homerically deſcribed in the Rama-yana. He eſpouſed the cauſe of Ravena, and was with his followers deſtroyed by Rama.

KHARASM, Charasm, or *Kharizm*, in *Geography*, a country of Aſia, bordered on the N. by Turkeſtan, on the E. by Great Bucharia, on the S. by Choraſan, or Koraſan, and on the W. by the Caſpian ſea; extending from the Gihon, or Amu to this ſea, and terminating N. and S. in wide deſerts. Its chief town is Khiva. This country is about 350 miles in length and breadth, and in the time of Zingis, was a powerful kingdom, including at that time Koraſan, and a part of Great Bucharia. D'Anville ſuppoſes, that this country was the Choraſmia of antiquity, and he ſuppoſes Koraſan to have been the ſeat of the Parthians. In the 10th century, Ebn Haukal calls this country Khuarezm, and ſays that the river Gihon flows into the lake of Khuarezm, while he terms the Caſpian the ſea of Khozr. We have reaſon to believe, that the deſerts, probably occaſioned by the decompoſition of hills of ſand-ſtone, have increaſed in Kharaſm; and theſe encroachments may be eſtimated from the hiſtorians of Zingis and Timur. At preſent this ſtate is almoſt reſtricted to the diſtrict of *Khiva* (which ſee), the circuit of which may be performed on horſeback in three days; but there are five walled cities or rather towns within half a day's journey of each other. The inhabitants are Turcomans and Uſbeks, beſides the Sarts, which perhaps is another name for the Tadjiks. The khan is abſolute and altogether independent of any other power, except the Mulla Baſhi, or high prieſt, by whom he is controlled. The Kievinſki Tartars differ very little from the Kirgeeſe or *Kirghiſes* (which ſee), but ſurpaſs them in cunning and treachery. Their manners are the ſame, only that the Kirgeeſe live in tents, whilſt the others inhabit cities and villages. Their only trade is with Bokhara and Perſia, whither they carry cattle, furs, and hides, all which they have from the Kirgeeſe and Turcoman Tartars, who are often very troubleſome neighbours to them. The place itſelf produces little more than cotton, lamb-furs of a very mean quality, and a ſmall quantity of raw ſilk, ſome of which they manufacture. Hanway, cited by Pinkerton. (See Khiva.) The hiſtory of Kharaſm has been well illuſtrated by its king, or khan, Abulghazi, in his general hiſtory of the Tartars, written about the year 1660. See his biographical article.

KHAREJITES, the firſt heretical ſect among the Mahometans, which revolted from Ali in the 37th year of the Hegira; and hence their name, which ſignifies "revolters," or "rebels." This ſect commenced with 12,000 men, who abandoned Ali and his cauſe, after having fought under him at the battle of Seffein, taking offence at his ſubmitting the deciſion of his right to the caliphate, which Moawiyah diſputed with him, to arbitration, though they themſelves had firſt obliged him to do it. They were alſo called Mohakkemites, or Judiciarians; becauſe the reaſon which they gave for their revolt was, that Ali had referred a matter concerning the religion of God to the judgment of men, whereas the judgment, in ſuch caſe, belonged only to God. The hereſy of the Khârejites conſiſted in two particulars; *viz.* 1. That they affirmed a man might be promoted to the dignity of Imam, or prince, though he was not of the tribe of Koreiſh, nor even a freeman, provided he was a juſt and pious perſon, and endowed with the other requiſite qualifications, and alſo held, that the Imam, if he turned aſide from the truth, might be depoſed or put to death, and that there was no abſolute neceſſity for any Imam at all in the world. 2. That they charged Ali with ſin, for having left an affair to the judgment of men, which ought to have been determined by God alone; and went ſo far as to declare him guilty of infidelity, and to curſe him, on that account. In the following year, *viz.* the 38th of the Hegira, all the Khârejites, who perſiſted in their rebellion, to the number of 4000, were cut to pieces by Ali. Nine of them are ſaid to have eſcaped, two into Oman, two into Kerman, two into Segeſtan, two into Meſopotamia, and one to Tel Mawrûn; and to have propagated their hereſy in thoſe places, the ſame remaining there to this day. The principal ſects of the Khârejites, beſides the Mohakkemites already mentioned, are ſix; which, differing in other reſpects, agree in abſolutely rejecting Othman and Ali, preferring the doing of this to the greateſt obedience, and allowing marriages to be imparted on no other terms; that they account thoſe who are guilty of grievous ſins to be infidels; and that they hold it neceſſary to reſiſt the Imam when he tranſgreſſes the law. Sale's Koran, Introd.

KHATANGA, in *Geography*, a river of Ruſſia, that has its ſource in a lake in the government of Tobolſk, about 68° N. lat. and 110° long.; and in 120° long. ruſhes into a large bay of the Frozen ocean, called Khatanſkaia Guba. This river purſues the greateſt part of its courſe through a low and very marſhy country; and the moſt conſiderable rivers which add to its waters are the Kheta and the Potigan.

KHATOUN-SERAI, a town of Aſiatic Turkey, in Caramania; 12 miles S. of Cogni.

KHAUAR, or Chever, a town of Perſia, in the province of Irak, ſeated on a mountain, which terminates the province of Irak towards Mazanderan, and gives name to a paſs, called the Strait of Khauar; 200 miles N. of Iſpahan.

KHAUASH, a town of Perſia, in Segeſtan; 18 miles N. of Zareng.

KHAULAN, a ſmall diſtrict of Arabia, in the province of Yemen; a few leagues S.E. of Sana. It is governed by an independent ſcheick, the repreſentative of a very ancient family; who ordinarily reſides at Beit Rodsje, a ſmall town in his own dominions. Several places which once belonged to the prince of Khaulan have been gradually annexed to the dominions of the Imam.—Alſo, a ſmall diſtrict of Arabia, lying among the mountains weſtward from Saade, upon the road from Sana to Mecca, four days journey from Hali, the extreme city upon that ſide of the ſherriff's territory. It has an independent ſcheick.

KHAZARES, the name of a bold and powerful Turkiſh tribe, which firſt occupied the iſthmus of Caucaſus between the Caſpian and the ſea of Azof. In the ſeventh century they began to be famous, and till towards the middle of the ninth century their ſtate was increaſing and flouriſhing. About that time the empire of the Khazares extended from the Volga and the Caſpian, acroſs the Caucaſian iſthmus, the peninſula of the Krimea, and what is now the ſouth of Ruſſia, as far as to Moldavia and Walachia; and ſeveral Slavonian tribes, particularly the Polianes about Kief and on the Dnieper, the Severans, on the rivers Deſna, Sem, and Sula, the Viatitſches on the Oka, and the Radimitſches on the Soſha, were tributary to them. But after the year 862, three nations effected their downfal; *viz.* the Ruſſians, the Petſchenegrans, and the Uzes. The Varagian or Ruſſian leaders, Oſkold and Dir, raviſhed from them the dominion over the Polianes; Oleg, in 884, reduced the Severans and the Radimitſches to his authority. His ſucceſſor, in 964, conquered the territory of the Viatitſches and the nine Khazarian countries on the iſthmus of Caucaſus. The Khazares loſt the reſidue of their dominion about 1016, to the combined forces of the Ruſſians and Romans of the eaſt. The nation, indeed, continued for ſome time longer, but they were ſubmiſſive and tributary to the Ruſſians. Tooke's Ruſſ. Emp. vol. i.

KHAZINE, the grand ſeignior's treaſury. See Treasury, and Exchequer.

Here are kept regiſters of receipts, accounts of provinces, in drawers, marked with the years, and the places' names: here is alſo kept part of the emperor's wardrobe.

Every day of the divan this treaſury is opened, either to take out, or put ſomething in; and the principal officers, who have the charge of it, are all to aſſiſt at this opening. The tchaouch-bachi, in their preſence, firſt breaks the wax with which the key-hole had been ſealed up, and carrying it to the grand vizir, that miniſter firſt kiſſes it, and then draws out of his boſom the grand ſeignior's gold ſeal. In the mean time he looks narrowly after the officer, who, when he has done his buſineſs in the treaſury, locks and ſeals up the place, and returns the ſeal to the vizir with the ſame ceremony as before.

Beſides this, there are other apartments for the money, where the officers are never allowed to enter with any clothes that have pockets in them.

KHEIR, in *Geography*, a town of Hindooſtan, in the country of Viſiapour; 18 miles N. of Poonah.

KHEIVAN, a town of Arabia, in a diſtrict of the ſame name, in the extenſive country of Haſchid-u-Bekil, is remarkable for having been the ſeat, firſt of the Hamjare monarchs, and afterwards of the Imams. Ruins of a very ancient palace are ſtill to be ſeen there.

KHEMLASA, a large walled town of Hindooſtan, adjoining to which is a fort, built upon a hill. It belongs to the diſtrict of Sagur, which is diſtant about 17 coſs to the ſouth eaſtward.

KHIEBAR, or Keibar. See Hedjas.

KHIEVA, or Khiva, a diſtrict of Kharasm, which ſee.—Alſo, the capital of this diſtrict and of Kharaſm, ſituated on a riſing ground, W. of the river Gihon, and having three gates, and a very thick, ſtrong wall of earth, much higher than the houſes, with turrets at ſmall diſtances, and a broad deep ditch full of water. It occupies a conſiderable ſpace, and commands a pleaſant proſpect of the adjacent plains, which the induſtry of the natives has rendered very fertile; but the houſes are low, moſtly built with mud, the roofs flat, and covered with earth. The city of Urghenz, which was formerly the capital of Kharaſm, is now in ruins, with only a moſque remaining. The moſt ſouthern town in the dominions of Khiva is Azariſt, or Hazaraſp, which adjoins to the great deſart, called *Karakum*, which ſee. Khiva is ſaid to ſtand at the diſtance of 17 days from the Caſpian ſea, and from Orenburg 33, computing the day's journey at 40 verſts; equal, by Hanway's account, to 17 Britiſh miles; ſo that the diſtance of Khiva from the Caſpian would be 459 Britiſh miles, while our maps ſcarcely allow 300. In 1739, the khan of Khiva aſſembled an army of 20,000 men, to oppoſe Nadir; but the city ſurrendered at diſcretion. According to the information of Pallas, the people of Khiva bring to Orenburg conſiderable quantities of raw cotton. But the coaſts of the Caſpian are held by ſome remains of Turcomans in the north, and by Uſbeks in the ſouth. A more conſiderable trade is maintained with *Manguſhlak*, which ſee. As the merchants of Khiva brought gold and gems to Aſtrachan, probably from the two Bucharias, an idea was ſuggeſted to Peter the Great, that theſe precious products were found in Kharaſm, in conſequence of which he attempted a ſettlement. But the Ruſſians, to the number of 3000, advancing under the command of a Circaſſian prince, called Beckawitz, towards Khiva, were all cut off by the Uſbeks. Upon this occaſion, as it has been ſaid, theſe Tartars changed the courſe of the Kheſel or Kezil, which formerly fell into the Caſpian; but as this river is on the E. of the Gihon, it is clear that it could not paſs that river to join the Caſpian; and in the 10th century the Gihon is known to have flowed into the Aral. It is not improbable that, before the deſerts encroached on Kharaſm, one or two rivers might have run to the Caſpian from the eaſt; or perhaps theſe fables may have ariſen from one or two ſmall branches of the Amu having joined that ſea. Pinkerton. Khiva is 260 miles N.W. of Samarcand. N. lat. 41° 30′. E. long. 58° 25′.

KHILLI, a cape on the N.E. coaſt of the iſland of Negropont. N. lat. 38° 36′. E. long. 24° 4′.

KHILLIS, a town of Syria, governed by an Aga; which, ſome years ago, was created into a pachalic, to reſtrain the Arabs; but the pacha being defeated, it was again put under an Aga. It is ſituated at the foot of Mount Taurus, and is a celebrated market for cotton; 28 miles N.N.W. of Aleppo.

KHIRTIPOOR, a town of Nepaul, the reduction of which coſt the conqueror ſo much trouble, that in reſentment of the reſiſtance made by the inhabitants, he cut off all the men's noſes. Col. Kirkpatrick, at the diſtance of 23 years, was reminded of this act of barbarity, by obſerving that a great proportion of the people appointed to tranſport his baggage acroſs the hills were deprived of their noſes. To perpetuate this exploit, the ſovereign ordered the name of the place to be changed to Naſkatapoor, which ſignifies "the town of men without noſes."

KHONDEMIR, in *Biography*, a celebrated Perſian hiſtorian, who obtained the patronage of the emir Ali Shir, a lover and protector of men of letters, whom he inſpired with a paſſion for his own favourite purſuit, and with the deſire of forming a collection of the principal writers in this claſs of ſcience. The great object which Khondemir had in view, was to facilitate the ſtudy of hiſtory by drawing it up in a more methodical manner, than had been done by other writers, and the reſult of his labours was a judicious compendium of oriental hiſtory from the creation of the world to the year 875 of the Hegira, under the title of "Khelaſſat Alakhar fi Veian Ahual Alakhiar," that is, "A faithful and correct Summary of what is valuable and intereſting in the moſt authentic and genuine Hiſtories."

KHORASAN, Korasan, *Choraſan*, or *Coraſan*, in *Geography*, a province of Perſia, ſituated in the N.E., and bounded on the N. by Kharaſm, on the E. by Bucharia and Candahar, on the N.E. by the river Gihon or Oxus, on the S. by the lake of Zurrah, or Durrah, and Segeſtan, and on the W. by the province of Mazanderan and the Caſpian ſea. This province comprehends the ancient countries of Margiana N. and Ariana S. Its length is eſtimated at 450 miles, and its breadth at 420. This country was comprehended within the dominions of Timur Bec, who conquered it in 1396, and granted it to his ſon Mirza Charoc, together with Mazanderan and Segeſtan. Its capital is Herat.

KHORFAKAN, a ſea-port of Arabia, in the province of Oman, ſituated in the bottom of a bay of the Arabian gulf, which is only open to the eaſt. On the S.E. ſide is a harbour for boats. The town is now in a reduced ſtate, conſiſting moſtly of fiſhermen's huts, with few houſes of ſtone. N. lat. 25° 15′. E. long. 56° 14′.

KHORREMABAD, or Curremabad, a town of Perſia, in the province of Irak, ſituated on a river which runs into the Karaſu; 200 miles W.N.W. of Iſpahan. N. lat. 34° 35′. E. long. 48° 5′.

KHOSCIAH, a town of Arabia, in the province of Hedsjas; 26 miles S.W. of Medina.

KHOUD, a town of Hindooſtan, in Oriſſa; 35 miles S. of Koonjoor.

KHUNTIJANT, a town of Hindooſtan, in Guzerat; 20 miles N. of Surat.

KIA, a town on the E. coaſt of the iſland of Gilolo.

KIAB, a town of Perſia, in the province of Chuſiſtan, on the Karaſu; 120 miles N. of Baſſora. N. lat. 32° 30′. E. long. 47° 40′.—Alſo, an Arabian tribe, called alſo by the Perſians "Tsjeb," who inhabit the furtheſt point upon the ſide of the Perſian gulf. The territory of this tribe extends from the deſert of Arabia to the country of the Hindian, and northward to the principality of Haviſa. It is watered by ſeveral rivers, large and ſmall. It abounds in dates, rice, grain, and paſture. Its principal cities are Dameh, lying within Perſia, Hafar, and Ghoban, the ſeat of a ſcheick, near one of the mouths of the Euphrates.

KIA-KING, a city of the firſt rank in China, in the province of Tche-kiang. This city is large and populous, and carries on a good trade; its ſuburbs are extenſive, and over the canals and ditches are ſeveral bridges, and there is not a houſe in the town, in which ſilk-worms are not bred. Canals are cut through all parts of the town; and its ſtreets are ornamented with beautiful piazzas, which ſhelter paſſengers from the ſun and rain. There are many triumphal arches within and without the city, and 15 marble towers on the ſides of the canal that lies to the weſt of the city, by which all the barks paſs. Seven cities of the third claſs are dependant upon it. N. lat. 30° 50′. E. long. 120° 14′.

KIAKILUMA, one of the ſmall Japaneſe iſlands. N. lat. 29° 50′. E. long. 132° 12′.

KIAKTA, or Kiachta, a town of Ruſſia, in the government of Irkutſk, ſituated on a ſmall river which runs into the Selinga: one of the places open, between the courts of Peking and Peterſburg, to private trade between the ſubjects of both nations; the other is Tzuruchatu, or Zuruchaitu, on the Argunia; according to a treaty, ſettled at Kiakta, in 1728. In 1762, the empreſs aboliſhed the imperial monopoly, and laid the fur trade open; ſince which time, no caravans have been ſent to Peking, and Kiakta is become the centre of the Ruſſian and Chineſe commerce; 60 miles S. of Selengiaſk. (Coxe's Ruſſian Diſcoveries, p. 220.) Kiakta contains about 150 houſes, inhabited ſolely by merchants and commiſſaries. Oppoſite to it, about 120 yards diſtant, lies the Chineſe village of Maimatſchin, containing about 200 houſes. Kiakta is reckoned the third trading city in Ruſſia, and ſtands 498 verſts S. of Irkutſk, and 1532 from Peking, on a ſmall ſtream of the ſame name. The following goods are exported free of duty; *viz.* all ſorts of paper, Ruſſian cloth (except the common cloth uſed by peaſants), and ſpirits diſtilled from fruits. Goods imported, which are duty free, are raw and dyed wools, glaſs-coral, falſe pearls, white lead, fans, ſewing needles, printed cottons, ginger, confectionary, rice, toys, muſical and other inſtruments, porcelain, earthen ware, lacquered and enamelled goods, furniture, and ornamental articles. The exportation of arms, warlike ſtores, powder and lead, ſpecie, gold and ſilver in ingots, ſtallions and mares, hides, beaver-hair, pot-aſh, reſin, and hemp-yarn, is prohibited; as is alſo the importation of ſalt, ſpirits, poiſons, and copper coin. Since the year 1754, the merchants of European Ruſſia, who traded with Kiakta, were allowed, on account of the diſtance, to pay the duties there by giving drafts. An order in 1794, extended this privilege to the Siberian merchants likewiſe, under the following conditions; the drafts muſt be given on Irkutſk, Tobolſk, Moſcow, or Peterſburgh, and made payable there. Nine months' payment was allowed, but 10 *per cent. per annum* were claimed by the crown for this allowance. The drafts muſt be drawn according to a particular form, and guaranteed. The moſt important articles of trade are peltry, partly imported to Peterſburgh from North America, particularly Canada, Ruſſian manufactures, *viz.* hides, leather, coarſe cloth, Ruſſia leather, Muſcovian woollens and ſilks, linen, metal and glaſs wares, and iſinglaſs; proviſions, *viz.* ſheep and cattle, ſalt meat, &c. and tallow and glue, foreign manufactures, particularly fine cloths. The principal articles imported, are fine ſilver in ſtamped bars; raw and wrought ſilk; raw and manufactured wool; tea; rhubarb, porcelain, tobacco, proviſions and preſerved fruits. The manner of conducting the commerce of Kiakta is as follows. Barter is the grand medium. The Chineſe come to the Ruſſian warehouſes, where the ſamples are laid out, previouſly to make their aſſortments. Bargains are often ſtruck on the ſpot, but generally the Chineſe go to the merchants' houſes to ſettle their buſineſs. At firſt the Ruſſians ſtate what Chineſe goods they will take in exchange; then the price is accurately fixed by both parties; and when they are agreed, they return to the warehouſe, where the Chineſe puts his ſeal on the bales, and ſometimes on the whole ſtock. Then the Ruſſian goes to the Chineſe, examines the goods which he is to receive in exchange, and if they anſwer the contract the barter is concluded. For the conveyance of this merchandize the Chineſe moſtly uſe camels, but ſometimes two-wheeled carts. When the caravans croſs the deſert in winter, they carry with them tents made of felt; but in ſummer they have balagans, made of reeds, which fold up and are put into a caſe. When the balagans are fixed, and covered with ſail-cloth, two perſons can ſleep in one of them very commodiouſly. All the Chineſe who trade to Kiakta underſtand the Mogul language, which is alſo ſpoken by the Ruſſian merchants.

The ſtate of the trade at Kiakta, from 1793 to 1797, was as follows :

Imports	- -	2,546,825 rubles
Exports	- -	2,543,785
Total	-	5,090,610

Zuruchaitu, another mart of the Ruſſian and Chineſe trade, though much inferior to Kiakta, is ſeated on the river Argun, and lies 1326 verſts eaſt of Irkutſk. When the Mogul troops are quartered on the frontiers during the ſummer, this place carries on a trifling bartering trade in articles of primary neceſſity, which are not worth the detail, as the trade is ſunk almoſt to nothing. From 1793, to 1797, the imports and exports amounted only to 724 rubles ; whereas from 1773, to 1777, they amounted to 2985 rubles.

KIALEK, a town of Perſia, in Adirbeitzan ; 50 miles N.W. of Urmia.

KIAM, a town of Egypt, on the right bank of the Nile ; 20 miles S. of Girgé.

KIANGARI, a town of Natolia, and chief place of a ſangiacate, defended by a caſtle on a rock; 256 miles E.S.E. of Conſtantinople. N. lat. 39° 54'. E. long. 34° 17'.

KIANG-NAN, a province of China, reckoned to be the moſt fertile, commercial, and opulent in the whole empire. It is bounded on the W. by the provinces of Honan and Hou-quang ; on the S. by Tche-kiang and Kiang-ſi ; on the E. by the gulf of Nan-king ; the reſt borders on the province of Chan-tong. The emperors long kept their courts in this province ; but they have ſince made choice of Peking, becauſe it is nearer to Tartary. This province is of vaſt extent, and contains 14 cities of the firſt claſs, and 93 of the ſecond and third. Theſe cities are very populous, and places of trade. Large barks can go to them from all places, becauſe the whole country is interſected by lakes, rivers, and canals, which have a communication with the great river Yang-tſe-kiang, or Kian-kou, which runs through the middle of the province. Silk ſtuffs, lacquer-ware, ink, paper, and, in general, every thing that comes from Nanking, as well as from the other cities of the province, are much more eſteemed, and fetch a higher price, than thoſe brought from the neighbouring provinces. In the village of Chang-hai alone, and the villages dependent upon it, there are reckoned to be more than 200,000 weavers, of common cotton cloths. The manufacture of theſe affords employment to the greater number of the women. In ſeveral places on the ſea-coaſt there are found many ſalt pits, from which ſalt is diſtributed over the whole empire. Upon the whole, this province is ſo abundant and ſo opulent, that it brings every year into the king's treaſury about 32,000,000 taels, a tael being equal to an ounce of ſilver, worth, in China, about ſix ſhillings ſterling ; excluſive of the duties upon exports and imports. The inhabitants, who, according to the eſtimate of ſir George Staunton, amount to 32 millions, are ingenious and docile ; and hence many of them become eminent in literature, and riſe by their abilities to offices of importance. This province is divided into two parts, each of which has a diſtinct governor. The governor of the eaſtern part reſides at Sou-tcheou, that of the weſtern at Nan-king, which is the capital of the province. Groſier.

KIANG-NING. See NAN-KING.

KIAN-FE, or TCHIANG-FE, a town of Thibet, near a river which runs into the Sanpoo. It is repreſented as a fine city with a fortreſs, and a convent, ſo extenſive, as to have the appearance of another city ; 25 miles S.W. of Laſſa. N. lat. 29° 58'. E. long. 90° 4'.

KIAN-KU, KIAM, *Kiang*, or *Yang-tſe-kiang*, one of the two great rivers of China, (the other being *Hoan-ho*, or *Hoang*, which ſee,) riſes in the vicinity of the ſources of the Hoan-ho ; but according to the received accounts and maps about 200 miles further to the weſt, and winds nearly as far to the ſouth as the Hoan-ho does to the north. After waſhing the walls of Nan-king, it enters the ſea about 100 miles to the ſouth of the Hoan-ho. The Kian-ku is known by various names through its long progreſs ; and near its ſource is called by the Eluts Porticho or Petchou : the courſe is about equal to that of the former, theſe two rivers being conſidered as the longeſt on the face of the globe : they certainly equal, if they do not exceed, the famous river of the Amazons in South America, and the majeſtic courſe of the Ganges does not extend half the length. In the late embaſſy of lord Macartney, the length of the Kian-ku is eſtimated at about 2200 miles ; and it is obſerved, that theſe two Chineſe rivers, taking their ſources from the ſame mountains, and paſſing almoſt cloſe to each other, in a particular ſpot, afterwards ſeparate from each other to the diſtance of 15° of latitude, or about 1050 Britiſh miles ; and finally diſcharge themſelves into the ſame ſea, comprehending a tract of land of about 1000 miles in length, which they greatly contribute to fertilize. To theſe great rivers many important ſtreams are tributary. Pinkerton.

KIANG-SI, a province of China, bounded on the N. by that of Kiang-nan, on the W. by Hou-quang, on the S. by Quang-tong, and on the E. by Fo-kien and Tche-kiang. The country is very fertile, but it is ſo populous, that it can ſcarcely ſupply the wants of its inhabitants. The mountains of this province are covered with medicinal plants and trees, and contain in their bowels mines of gold, ſilver, lead, iron, and tin. The rice of this country is delicate, and ſeveral barks are loaded with it every year for the court. The porcelain, made principally at King-te-ching in this province, is the fineſt and moſt valuable of the empire ; and the wine made from this rice is reckoned delicious by the Chineſe. The river Kan-kiang divides the whole province into two parts ; and it contains 13 cities of the firſt claſs, and 78 of the ſecond and third. The capital is Nan-tchang. The population of the province, according to ſir George Staunton's ſtatement, is 19,000,000.

KIAO-KE, a town of Corea ; 72 miles W. of King-ki-tao.

KIAO-TAO, a ſmall iſland of China, in the Hoan-ho, or Yellow river, near the coaſt of Corea. N. lat. 38° 13'. E. long. 124° 25'.

KIARE, a town of Perſia, in the province of Irak ; 30 miles S.W. of Caſbin.

KIA-TCHUEN, a town of Corea ; 27 miles S.S.W. of Sing-tcheou.

KIA-TING, a city of China, of the ſecond claſs, in the province of Se-tchuen, on the river Yang : great quantity of muſk is collected in the environs of this city. N. lat. 29° 29'. E. long. 103° 30'.

KIAUTEN, a town of Pruſſian Lithuania, ſituated in a mountainous country, with an iron foundery, and a large manufacture of paper.

KIAYA-BEY, an officer in the Ottoman empire, who is the lieutenant of the viſir, and momentarily diſcharges his functions when the latter happens to die. All affairs paſs through his hands before they arrive at the viſir, and all orders emanating from the Porte receive their execution through the impulſe of the kiaya-bey. He is appointed by the grand ſignior, on the preſentation of the viſir. He is generally involved in the diſgrace of his principal, and if he do not loſe his head as frequently as the other, his fortune always, in that caſe, runs the greateſt riſk. Although he has no military rank, it may be ſaid that he occupies the ſecond adminiſtrative place in the empire, conſidering the importance and multiplicity of his functions. If the ſultan be diſſatisfied with his ſervices, he receives, on quitting his office, the dignity of ſimple viſir, or pacha with three tails. It ſeldom happens that he is given only the two tails when he is ſent to govern a province. See Bey.

KIBBIED, in *Geography*, a town of Africa, in Bornou; 150 miles S.E. of Bornou. N. lat. 18° 23′. E. long. 24° 16′.

KIBES. See Chilblain.

KIBITKA, a travelling carriage in Ruſſia, which is a ſmall cart capable of containing two perſons abreaſt, while the driver ſits on the farther extremity cloſe to the horſes' tails. It is about five feet in length, and the hinder half is covered with a ſemi-circular tilt, open in front like the top of a cradle, made of laths, interwoven and covered with birch or beech-bark. There is not a piece of iron in the whole machine. It has no ſprings, and is faſtened by means of wooden pins, ropes, and ſticks to the body of the carriage. The Ruſſians, when they travel in theſe kibitkas, place a feather-bed in the bottom, admirably calculated to break the intolerable jolts and concuſſions occaſioned by the uneven timber roads. With this precaution, a kibitka, though inferior in ſplendour, equals in comfort the moſt commodious vehicle. The traveller ſtretches himſelf at length upon the feather-bed; and, if inclined, may doſe away the journey in perfect tranquillity.

KIBOLA, in *Geography*, a town of Mingrelia; 25 miles S.E. of Anarghia.

KICKAPOO, a town of America, in the Weſtern territory. N. lat. 40° 20′. W. long. 87° 10′.

KICKAPOUS, an Indian nation, whoſe different tribes inhabit near the entrance of lake Superior, where, ſome years ago, they had 400 warriors; ſome reſide at lake Michigan, and between that and the Miſſiſippi, near the Outtagomies, &c.; and another tribe near the Piankeſhaws, and on the Wabaſh and its branches. The Kickapous and Kaſkaſkias, two Indian nations lately hoſtile, ceded lands to the United States at the treaty of Greenville, Aug. 3, 1795. See Kaskaskias.

KICKEMNIT, a river of America, being the north-weſtern arm of Mount Hope bay; about two miles long, and half a mile broad. North-weſt of it lies the town of Warren, in the ſtate of Rhode iſland.

KICKER, in *Agriculture,* a term applied to ſuch horſes as have the habit of kicking: this ſhould be particularly guarded againſt in the rearing and managing of young horſes, eſpecially thoſe intended for team labour.

Kicker *againſt the Spurs*, in the *Manege*. See Ramingue.

KICKTOOL, in *Geography*, a town of Eaſt Greenland. N. lat. 61° 15′. W. long. 45° 5′.

KICYDANI, a town of Lithuania, in the palatinate of Wilna; 48 miles N.N.W. of Troki.

KID, a ſmall iſland near the weſtern coaſt of Ireland, a little N. of Broadhaven; 3 miles S.W. of Browy Head.

Kid, a name applied to the young of the goat kind. See Goat.

Kid, in *Rural Economy*, a ſmall faggot of under, or bruſhwood.

KIDARNAUT, in *Geography*, a town of Thibet; 100 miles N. of Sirinagur. N. lat. 32° 4′. E. long. 79° 12′.

KIDDER, Richard, in *Biography*, a learned Engliſh prelate, of whoſe early life no account has come down to us. In the year 1649, he was ſent to Emanuel college, Cambridge, where he took his degrees. Two years afterwards, he was incorporated at the univerſity of Oxford. He was preſented by his college to the vicarage of Stanground, in Huntingdonſhire, from which he was ejected for non-conformity, under the Bartholomew Act, in 1662. Either the fear of ſuffering, or ſome other motive, ſoon brought him back to the boſom of the church, and he was, in 1664, preſented by the earl of Eſſex to the rectory of Raine. Here he continued about ten years, eſteemed by his connections, and in high reputation for learning, particularly for his extenſive and deep knowledge of the oriental languages. In 1674, he became rector in the metropolis, and, in 1681, he obtained a prebendary in the cathedral church of Norwich, which was ſucceeded by his nomination to the deanery of Peterborongh in the year 1689. About this period he took his degree of D. D. and in 1691 he was conſecrated biſhop of Bath and Wells. In 1693, he preached the lecture founded by Mr. Boyle, and afterwards inſerted his ſermons on that occaſion in his "Demonſtration of the Meſſias," of which work they conſtitute the firſt three chapters in the ſecond part. The biſhop continued his labours as an author till he was unhappily killed in his bed, together with his lady, by the fall of a ſtack of chimnies in his palace at Wells, during the great ſtorm in the night of Nov. 26th, 1703. He was eſteemed one of the beſt divines in his time. His largeſt work, next to that already mentioned, was "A Commentary on the Five Books of Moſes, with a Diſſertation concerning the Author or Writer of thoſe Books, &c." in 2 vols. 8vo. Biſhop Kidder was author of "The Life of Dr. Anthony Horneck," 1698: "Critical Remarks upon ſome difficult Paſſages of Scripture in a Letter to Sir Peter King," 1719, a poſthumous publication; ſeveral practical treatiſes; tracts on the Popiſh controverſy, &c. Biog. Brit.

KIDDERMINSTER, in Domeſday Book written *Chideminſter*, in *Geography*, a market town and pariſh in the hundred of Halfſhire, and county of Worceſter, England, is ſeated on the river Stour, at the diſtance of 13 miles of Worceſter, and 126 N.W. of London. In the year 1800, the town contained 1695 houſes, and 8036 inhabitants, the majority of whom were dependant on, or connected with, the manufactures of the place. In the time of king Henry VIII. Kidderminſter was noted for its manufactures, firſt of broad cloths, afterwards of wolſeys, and ſubſequently of bombaſines, crapes, and poplins. But early in the laſt century the carpet buſineſs was introduced here, and has been continued, with increaſing ſucceſs, up to the preſent time. In the year 1772, the town and its ſuburbs contained no leſs than 250 looms, and ſince that time a larger number has been employed. At firſt, the carpets made here were of the Scotch and flat ſpecies; but ſoon the cut carpets were invented, and this kind has ſince continued to be the diſtinguiſhed claſs of Kidderminſter. By ſundry charters from Henry II., Richard II., Henry VI., and Henry VIII., the inhabitants are granted an exemption from toll, pontage, and murage throughout the whole kingdom; all theſe privileges are alſo confirmed by a charter from queen Elizabeth. In this town the lord of the manor, or his deputy, occaſionally holds a court-leet, principally for the prevention of encroachments and public nuiſances; here is alſo a court of requeſt for recovery of debts under forty ſhillings. No county-juſtice has a right to exerciſe any judicial authority in this town, which is governed by a recorder and bailiff; the latter is annually elected by his brother aldermen, twelve in number, with the concurrence of twenty-five common-council-men, who collectively are enabled by charter 12 Charles I.

to make bye-laws for the government of the body-corporate and the trade of the town. It formerly ſent members to parliament. A market is held on Thurſdays for all ſorts of grain; but this article is now chiefly diſpoſed of by ſample: here are four annual fairs. The church, a large ſtructure of great antiquity, is capable of containing more than two thouſand perſons. In the choir are ſeveral ancient monuments belonging to the Bounts and Cookeſeys; alſo a croſs-legged effigy of the late ſir Thomas Acton. The tower is a ſtrong and lofty pile. The grammar-ſchool, to which all the inhabitants have the privilege of ſending their children free of expence, is at the eaſt end of the choir of the church: the preceptors, one deſcribed in the charter as the high, the other as the low maſter, are elected by certain feoffees, to which the conſent of the biſhop is always neceſſary: their annual ſtipend, upwards of 150*l.*, ariſes from buildings and lands with which the ſchool is endowed. The town-hall, which is principally conſtructed of brick, is roomy and elegant: a portion of the lower part is uſed as a priſon, but to the credit of the town, it is very rarely occupied: on what is called the ground-floor are erected ſtalls for the butchers: and, above is the council-chamber for tranſacting the buſineſs of the corporation. Kidderminſter, by the late inland navigation, has communication, by the junction of the Severn canal, with the rivers Merſey, Dee, Ribble, Ouſe, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above five hundred miles. The river Stour riſes in the celebrated groves of the Leaſowes, near Hales Owen, diſtant from hence about twelve miles, and after forming a large reſervoir at a village called Cradely, proceeds through Stourbridge, Kinver, and Wolverley, and enters Kidderminſter on the north ſide, tracing nearly its whole length, and thereby dividing it into two unequal parts. Over this little river, whoſe length is not more than twenty miles, part of which was once navigable, are now erected a great number of forges, ſlitting-mills, corn-mills, and other works of conſiderable utility: and to the fitneſs of its waters to the purpoſe of dyeing is attributed, in a conſiderable degree, the unequalled luſtre of the colours of the yarn uſed in the ſeveral branches of the weaving manufactory here, which, on this account, is juſtly eſteemed an inexhauſtible ſource of wealth to the inhabitants. The Staffordſhire and Worceſterſhire canal, completed in the year 1774, at the expence of 105,000*l.*, croſſes the Stour within one hundred yards from Kidderminſter market-place. In this town are three reſpectable reading ſocieties for cultivating the taſte of the wealthier inhabitants; and the inſtruction of the poor is not forgotten; for, excluſive of ſeveral Sunday ſchools, no leſs than eight charity ſchools are eſtabliſhed. Here are alſo twelve alms-houſes, and other charitable endowments. At Round-hill, in this town, is a chalybeate ſpring of great medicinal virtues; and in the vicinity are ſeveral others, of which that at Sandburn is the ſtrongeſt. Britiſh Directory, vol. iii. The name of Baxter was long held in veneration in this town. See his article.

KIDDERS, thoſe that badge or carry corn, dead victuals, or other merchandiſe, up and down to ſell: every perſon being a common badger, kidder, lader, or carrier, &c. ſays the ſtat. 5 Eliz. cap. 12. And they are called kiddiers, 13 Eliz. cap. 25.

KIDDLE, or KIDEL, *Kidellus*, a dam or weir in a river, with a narrow cut in it, for the laying of pots, or other engines to catch fiſh.

The word is ancient; for in Magna Charta, cap 24. we read, "omnes kidelli deponantur per Thameſiam & Medweyam & per totam Angliam, niſi per coſteram maris." And by king John's charter, power was granted to the city of London," de kidellis amovendis per Thameſiam & Medweyam." A ſurvey was ordered to be made of the weirs, mills, ſtanks, and kidells, in the great rivers of England, (1 Hen. IV.) Fiſhermen of late corruptly call theſe dams *kettles*; and they are much uſed in Wales, and on the ſea-coaſts of Kent.

KIDDOW, in *Ornithology*, the moſt common Engliſh name of the *lomwia*, a web-footed bird, common on our ſhores, and called in different places the guillemot, or guillem, and the ſea-hen and ſkout. See COLYMBUS *Troile*.

KIDED, in *Agriculture*, a term provincially applied to the pods of beans.

KIDELIA, in *Geography*, a town of Ruſſia, in the government of Viborg, on the N. coaſt of lake Ladoga; 48 miles N.N.E. of Kexholm.

KIDEROW, in *Rural Economy*, a term that ſignifies a place for keeping a ſucking-calf in.

KIDES, in *Geography*, a town of Sweden, in the government of Kuopio; 83 miles S.E. of Kuopio.

KIDGE, a fortified town of Perſia, in the province of Mekran. N. lat. 26° 30′. E. long. 61° 10′.

KIDNAPPERS, CAPE, a cape on the E. coaſt of New Zealand, diſcovered in 1769, and thus named by captain Cook, from an attempt made by the inhabitants to carry a boy from the Endeavour. It is remarkable for two white rocks like hay-ſtacks, and high white cliffs on each ſide. S. lat. 39° 43′. W. long. 182° 24′.

KIDNAPPING, in *Law*, is the offence of a forcible abduction or ſtealing away of a man, woman, or child, from their own country, and ſending them into another. This offence was capital by the Jewiſh law. (Exod. xxi. 16.) So likewiſe in the civil law, the offence of ſpiriting away and ſtealing men and children, which was callled "plagium," and the offenders "plagiarii," was puniſhed with death. (Ff. 48. 151.) This is unqueſtionably a heinous crime, as it robs the king of his ſubjects, baniſhes a man from his country, and may in its conſequences be productive of the moſt cruel and diſagreeable hardſhips; and, therefore, the common law of England has puniſhed it with fine, impriſonment, and pillory. (Raym. 474. 2 Show. 221. Skin. 47. Comb. 10) Alſo, if a maſter of a ſhip ſhall, during his being abroad, force any perſon aſhore, or wilfully leave him behind, or refuſe to bring home all ſuch men as he carried out, if able and deſirous to return, he ſhall ſuffer three months impriſonment. 11 & 12 W. III. c. 7.

KIDNEY, in *Anatomy*, a glandular body, ſituated in the abdomen, and ſecreting the urine.

The urinary apparatus conſiſts of two ſecretory organs (the right and left kidnies), by which the urinary fluid is ſeparated from the blood; of two membranous tubes (the ureters) by which this fluid is conveyed into a large muſculo-membranous reſervoir (the urinary bladder); and of a canal (the urethra) by which this reſervoir is evacuated at various intervals. The latter conveys the ſeminal fluid alſo in the male ſubject, and is therefore deſcribed in the article GENERATION. The different arrangement and conformation of the female generative organs occaſion the urethra to aſſume a very different form: it is here entirely unconnected with the generative functions, and we ſhall therefore deſcribe it in the preſent article with the bladder.

The eſſential parts of the urinary apparatus correſpond nearly to thoſe of the biliary organs; but there are ſome remarkable differences. The liver is always a ſingle organ. There are almoſt conſtantly two kidnies. The proportions of the ſecretory organ and the reſervoir are inverſe in the two caſes: the liver is ſo large as to exceed probably all the other glands in the body put together: the gall-bladder is comparatively ſmall: in the other caſe, the capacity of the reſervoir conſiderably exceeds the ſize of the glandular organs. A part only of the bile paſſes into the gall-bladder, the remainder flowing directly into the duodenum: and this ſecretion ſeems not to be very active in the intervals of the digeſtive proceſs. The kidnies, on the contrary, are always active, and the whole of the fluid which they ſeparate paſſes into the urinary bladder.

Two ſmall bodies, placed near the kidnies, and called the renal capſules, receive their veſſels for the moſt part from the renal: we ſhall therefore unite their deſcription with that of the kidnies.

The kidnies are placed deeply in the lumbar regions, at the ſides of the vertebral column. They are uſually two, a right and a left; but the number is expoſed to occaſional unimportant variations. Sometimes the two are united by their upper or lower extremities, ſo as to form a creſcent, with the concavity upwards or downwards, ſomething like the figure of a horſe-ſhoe, from which the gland, in theſe caſes, is ſometimes named: or, there may be an unuſually large one on either ſide, with two ureters, and a deficiency of the oppoſite gland: or, a ſmall ſupernumerary kidney on the front of the vertebral column. Other deviations from the accuſtomed ſtructure have been regiſtered by anatomiſts; but all theſe varieties are unimportant in phyſiology.

They are ſurrounded by a large quantity of fat, of a peculiar ſtructure and properties. This ſubſtance is contained in a looſe and eaſily lacerable cellular texture, which connects it to the kidney; it forms a complete caſe, iſolating theſe organs from the ſurrounding parts. Its quantity varies remarkably in different ſubjects, being ſo abundant as to hide the organs where the individual is very fat, and very ſparing in the oppoſite ſtate. This fat is remarkable for growing hard when it is cold, particularly in the ruminating herbivorous animals, where it is diſtinguiſhed by the name of ſuet.

On account of the different bulk of the liver and ſpleen, the two organs, which are placed immediately above the kidnies, the latter are ſomewhat differently ſituated on the two ſides of the body, the right being rather lower than the left: the difference in this reſpect may amount to an inch, but it is not conſtant. They both lie deeply buried behind the abdominal viſcera; the right having above it the renal capſule and the liver, and in front the colon and cæcum, the duodenum, and the other ſmall inteſtine; the left being covered by the ſpleen and pancreas, ſtomach, colon, and ſmall inteſtine.

The figure is juſtly compared to that of the kidney bean, with the concavity placed inwards. It is elongated from above downwards, convex in the greateſt part of its circumference, and rather broadeſt at its upper end. The ſize varies conſiderably, from four ounces in the adult to five, ſix, or even a pound: often one is conſiderably larger than the other.

In order to deſcribe more exactly the external form and the relations of the kidney, we divide it into two ſurfaces and a circumference. The anterior ſurface is ſlightly convex: ſometimes completely covered by the peritoneum, with the interſection of a ſtratum of variable thickneſs of fat and looſe cellular ſubſtance; and ſometimes in more or leſs immediate contact with the correſponding part of the colon: for in ſome ſubjects the membrane ſimply paſſes in front of the inteſtine, and binds it to the kidney, while in others there is a more or leſs looſe fold, called the lumbar meſocolon. From the right kidney the peritoneum riſes to the liver above, and even to the diaphragm; below, it paſſes to the colon and duodenum; on the left ſide it goes to the colon and ſpleen. Cellular ſubſtance, containing more or leſs fat, always connects the front ſurface of the kidney to the membrane; ſo that the gland is behind the cavity formed by that membrane, and would not be enumerated among the abdominal viſcera, if that epithet were confined to the parts contained within the cavity of the membrane.

The poſterior ſurface is nearly plane, and reſts on a thick layer of fat, which ſeparates it from the lower part of the diaphragm, from the anterior layer of the aponeuroſis of the tranſverſus, where it covers the quadratus lumborum, and from the pſoas magnus.

Thus, there is placed behind the kidney the thick maſs of ſoft parts, which extends from the pelvis to the cheſt, protecting the organ from all external injury, and rendering it nearly inacceſſible to the knife of the ſurgeon. It is alſo ſupported behind by the two or three laſt ribs. In its longitudinal direction it correſponds nearly to the two laſt dorſal, and the two neighbouring lumbar vertebræ.

The circumference of the kidney preſents a thick and rounded extremity above, covered by the concave baſis of the renal capſule; a thinner and more elongated end below, approaching more or leſs nearly to the criſta of the ilium: a convex, thick, and rounded edge, turned outwards, and correſponding to the muſcular parietes of the abdomen and the diaphragm; a deep excavation on the inſide, called the notch of the kidney. This notch has thick and rounded edges, and contains ſome fat. The diviſions of the renal artery occupy the upper and front part, thoſe of the vein are placed behind: the pelvis occupies the deepeſt portion, and the commencement of the ureter is ſeen below.

The conſiſtence of the kidney is remarkably firm, exceeding, in this reſpect, all other glandular organs. Its colour is reddiſh, with a tinge of brown; but the intenſity varies according to the quantity of blood contained in the veſſels. When an animal has died of hemorrhage, it is quite pale. The ſtructure of the organ comprehends a peculiar glandular tiſſue, arteries, veins, lymphatics, nerves, excretory tubes, and a peculiar membrane.

The proper tiſſue of the kidney is remarkable for its firmneſs. It will be beſt underſtood by carrying a ſection through the kidney, ſo as to divide it into an anterior and a poſterior half. We ſhall then be able to diſtinguiſh very clearly two ſubſtances; an exterior, which is called the *cortical* or *arterial*, and an interior, named the *tubular* or *uriniferous*. All kidnies are not equally well ſuited for this examination: in ſome, without any alteration from diſeaſe, the two ſubſtances are confuſed together. The contraſt of the two component parts is ſeen particularly clearly after minute injection.

The ſection of the kidney preſents to us alſo, diſpoſed in a ſtill more deeply ſeated ſtratum than the tubular part, a ſeries of ſmall bodies, called *papillæ* or *mamillæ*, which are merely the apices of the ſmall cones formed by the tubular ſubſtance. Many anatomiſts deſcribe theſe as a third ſubſtance, under the name of the *mamillary*. Laſtly, we obſerve the infundibula or calyces, and the pelvis, beſides the orifices of divided veſſels ſcattered here and there.

The cortical ſubſtance is ſo named becauſe it covers the exterior ſurface of the organ: it is about two lines in thickneſs. Its colour is a paliſh red, inclining to yellow: its conſiſtence is leſs firm than that of the tubular, and is about the ſame with that of the liver, ſo that it may be torn eaſily. It is ſmooth externally, and cloſely connected to the proper membrane of the kidney. Internally it is continuous with the tubular ſubſtance, and it forms prolongations

tions which fill the intervals of the different portions of the tubular matter. Theſe ſepta have been called the fleſhy columns of the kidney: they grow thinner as they approach the pelvis, round which there is always found ſome adipous ſubſtance. Their number depends upon that of the papillæ. The renal arteries are diſtributed almoſt entirely to the cortical ſubſtance: injections thrown into theſe veſſels penetrate it moſt eaſily, and colour it throughout: hence it has been concluded to be of a nature entirely vaſcular. Some anatomiſts have admitted the exiſtence of very ſmall glands in this ſubſtance, connected to the blood-veſſels as grapes are to their ſtalks; theſe are technically named acini. On tearing the cortical ſubſtance, ſmall granulations are obſerved on the torn ſurface, and minute granular bodies are ſeen in great abundance throughout this part of the kidney, where it has been minutely injected. Theſe are conſidered as the glands in queſtion, while ſome contend that they are only convoluted blood-veſſels. For an account of the controverſy on this matter, ſee Gland. The minuteneſs of the objects does not allow us to arrive at any ſatisfactory concluſion concerning their intimate ſtructure.

The tubular or uriniferous, called alſo the ſtriated ſubſtance, is lighter in its colour, more denſe and ſolid than the cortical. Injections do not penetrate it, but leave it in general quite colourleſs. It is compoſed of a vaſt number of ſmall tubes (tubuli uriniferi) united into conical faſciculi of unequal ſize. The rounded baſes of theſe faſciculi are turned towards the exterior of the kidney, and preſent diverging ſtriæ, which are loſt in the cortical ſubſtance: their apices are directed towards the notch. Theſe faſciculi are every where ſurrounded by the cortical ſubſtance, except at their apices, which are embraced by the infundibula. Each of theſe points forms a conical papilla, pierced by numerous ſmall apertures, which are the openings of the tubes juſt mentioned.

The papillæ, therefore, are ſimply the points of the cones which conſtitute the tubular ſubſtance: their number varies from five to eighteen. Generally there is a ſingle papilla for each cone; ſometimes two cones are united by one papilla, which is then larger; two papillæ are very ſeldom found on one cone. Their form and length are very various; they may be ſhort and rounded, or long and pointed. They are of a tolerably bright red colour, but ſometimes rather pale, while the reſt of the tubular ſubſtance is redder, or even of a violet hue at the baſis of the cones. Their ſurface is ſmooth, ſoft to the touch, and probably covered by a fine membrane. The orifices of the uriniferous tubes are ſeen on it, and as theſe are much leſs numerous than the ſtriæ of the tubular ſubſtance, probably ſeveral of the fine tubes unite together before they terminate. Compreſſion of the kidney cauſes the urine to tranſude at theſe pores; and the urine may be expreſſed in like manner, when the papillæ have been divided by a ſection perpendicular to the courſe of the tubes.

From the preceding deſcription of the two ſubſtances which compoſe the kidney, it appears, that the cortical performs the ſecretion, and that the tubular, completely unconcerned with this function, has the office of tranſmitting the ſecreted fluid. Thus it differs from all other glands of which the component ſubſtance is identical throughout.

That the arteries of the kidney are entirely diſtributed in the cortical matter is evident from anatomical injections: the exact mode in which they are connected to the uriniferous tubes hardly admits of being unravelled. The arteries ſeem to be continued towards the cones, where they are joined to the cortical matter, and injections often paſs from them into the uriniferous tubes, which are then ſeen running in ſtraight lines, and converging towards the papillæ. Ruyſch and others found that water, quickſilver, ſuet, wax, and air, thrown into the renal arteries, would come out at the pores of the papillæ, which is a ſtrong argument for the exiſtence of continuous tubes. A further proof of the ſame circumſtance has been drawn from the paſſage of actual blood in many inſtances by the urinary paſſages.

The baſis of each papilla is embraced by a ſmall membranous tube, into the cavity of which the apex projects. Theſe calyces, or infundibula, are ſurrounded externally by ſome fat, and are leſs numerous than the papillæ, becauſe two or three of the latter are ſometimes furniſhed with a ſingle tube. They are collected ordinarily into three trunks, which come reſpectively from the upper, middle, and lower parts of the kidney. Theſe three trunks open at the notch into the pelvis: ſometimes a greater number of branches opens into this membranous bag. The pelvis is placed at the deepeſt part of the notch, behind and between the diviſions of the renal artery and vein. It is moſt capacious in its middle, narrower at the two ends, and continued below into the ureter. The openings of the trunks formed by the union of the calyces, and of the ureter, are obſerved on its inner ſurface. Theſe are ſimple openings without any valvular apparatus. Sometimes there are two pelves to a ſingle kidney.

The pelvis and calyces are compoſed of a firm, white, and opaque membrane, connected by a looſe cellular texture to the ſurrounding organs, and having a ſmooth mucous ſurface internally, continuous with that of the ureter, and with the covering of the papillæ. Its ſtructure is denſe, and not very vaſcular; of its properties and action we know nothing. Bichat and Boyer diſtinguiſh three ſtrata in this membrane; an exterior, derived from the capſule of the kidney; a middle, or proper membrane, continued at the baſes of the papillæ into the ſubſtance of the organ; and an internal, or mucous coat.

The arteries and veins of theſe glands will be deſcribed in the articles concerning thoſe veſſels; we have only to point out a few circumſtances here concerning them. The renal arteries ariſe nearly at right angles, and paſs through a ſhort courſe before they arrive at their deſtination. Their diameter is very conſiderable in proportion to the volume of the organ. It is ſhewn by ſome calculations, the reſults of which cannot be received with very implicit confidence, that one-fourth or one-third of the blood of the abdominal aorta goes to theſe glands, conſequently, a very large proportion of the whole maſs. Hence the whole of the blood will have paſſed through the kidnies in a few pulſations of the heart. They are covered and accompanied by the renal veins; both veſſels divide near the kidney into ſeveral branches, which enter the notch and penetrate into the organ, accompanied by nerves and lymphatics. All theſe parts are ſurrounded by a looſe cellular tiſſue, continued apparently with that contained in the notch. The proper membrane of the kidney adheres to theſe faſciculi. The large branches occupy the intervals of the papillæ, and follow a winding courſe round the cones; the ſmaller ramifications form arches in the cortical ſubſtance, from the convexity of which numerous ramifications are [illegible] that ſubſtance. They ſeem to terminate [illegible] of the cortical and tubular parts by uriniferous t[illegible]. The veins have a diſpoſition analogous to that of the [illegible].

The lymphatic veſſels, diſtinguiſhed into ſuperficial and deepſeated, communicate frequently. They follow the courſe of the blood-veſſels, paſs out at the notch, and go to the lumbar glands.

The nerves, derived from the ganglia of the great ſympathetic, conſtitute the renal plexus, of which the branches ſurround the blood-veſſels, particularly the artery, and penetrate with it into the kidney. The kidnies ſeem to be hardly ſenſible in the natural ſtate: but diſeaſe, as, for example, inflammation, developes their ſenſibility in a very high degree.

The external ſurface of the kidney is cloſely inveſted by a peculiar membrane, ſometimes called the capſule, which adheres by means of ſhort and very fine threads, but can be ſeparated without much difficulty. It enters the notch, and is connected there to the calyces and blood-veſſels. It is very denſe and firm, ſemi-tranſparent, rather thicker than the peritoneum, and not diviſible into laminæ. Immerſion in boiling water makes it curl up and become thicker.

The ureter is the tube deſigned to convey the urine from the kidney, commencing from the inner and lower part of the pelvis of the kidney by a wide opening, ſometimes called infundibulum, and continued thence in a deſcending courſe to the inferior ſurface of the bladder, where it is not more than an inch diſtant from its fellow of the oppoſite ſide. Its ordinary ſize is about equal to that of a quill, except towards the lower extremity, where it is ſlightly contracted; but it varies in this reſpect in different ſubjects; and even in different parts in the ſame ſubject. Commonly there is one to each kidney, but ſometimes it is double.

From its origin it goes obliquely inwards and downwards as far as the front of the ſacro-iliac ſymphyſis, where it is ſeparated from the oppoſite one by the breadth of the baſis of the ſacrum. In this part of its courſe the peritoneum and the ſpermatic veſſels lie in front: the pſoas muſcle, which it croſſes at a very acute angle, is behind it. Lower down it croſſes the common iliac artery and vein. The right tube lies parallel to the outer ſide of the inferior vena cava. Several ſmall blood-veſſels are diſtributed on it. At the baſe of the ſacrum it paſſes forwards, downwards, and inwards through a large quantity of adipous ſubſtance, and advances towards the under ſurface of the bladder. Here it croſſes the vas deferens, and is placed a little above and externally to the veſicula ſeminalis, at which point it penetrates the bladder. It runs obliquely between the coats of that organ, paſſing for about an inch from without inwards and from behind forwards, between the muſcular and mucous coverings, and then opening into the cavity by a very narrow orifice placed at the poſterior angle of the triangular ſpace near the neck of the bladder.

The courſe of theſe tubes is the ſame in the female; they preſent no peculiarities worthy of notice in the pelvis of this ſex.

As the ureter is a continuation of the pelvis, we naturally expect to diſcover in it the ſame organization as in that bag. Anatomiſts deſcribe three coats; an exterior, thin, tranſparent, and of a cellular nature; a middle, which is thicker, and gives to the part its colour and conſiſtence; and an internal mucous covering, continuous with thoſe of the pelvis of the kidney and bladder, and habitually moiſtened, like them, with a mucous fluid capable of defending it from the action of the urine. Theſe ſtrata are, however, ſo cloſely connected, that it is almoſt impoſſible to exhibit them diſtinct. The blood-veſſels are derived from the renal, the ſpermatic, the aorta and vena cava inferior, and the iliacs.

The ureters, as well as the pelvis and calyces of the kidney, are very extenſible: their ordinary functions probably require the exerciſe of ſuch a property, as they muſt be ſubject to various conditions of plenitude and emptineſs. But diſeaſe elucidates this point moſt clearly: when the natural paſſage of the urine is obſtructed by a ſtone, or when it is diſturbed by difficulties in the evacuation through the urethra, the ureters are often enlarged very conſiderably, even in ſome caſes almoſt to the ſize of a ſmall inteſtine, and the pelvis, with its dependencies, undergoes an analogous dilatation.

Theſe parts do not ſeem to poſſeſs animal ſenſibility in their natural ſtate; but that property is manifeſted in them to the higheſt degree, by the paſſage of a ſtone, which cauſes perhaps torture as exquiſite as any diſeaſe of any organ in the body.

Their function of conveying the ſecreted urine from the kidney to the bladder, requires the exerciſe of tonic powers: the idea of this fluid finding its way by the force of gravity, is not only repugnant to the laws of the animal economy, but is irreconcileable with obvious phenomena. The adheſion of the ſides of the tube, where it penetrates the coats of the bladder, preſents an obſtacle, which can be overcome only by the exertion of ſome force; and this obſtacle is vaſtly increaſed in the diſtended ſtate of the bladder, during which the fluid is conſtantly finding its way into the receptacle. The only power in this caſe, by which the requiſite end can be obtained, is a contraction of the canal.

Developement of the Kidney.—In the fœtus all parts of the urinary apparatus are remarkable for their conſiderable advancement; and ſome are diſtinguiſhed by conſiderable peculiarities of conformation and ſtructure. The kidnies are very large, ſurrounded at firſt by a ſoft and reddiſh cellular tiſſue, but covered, before the end of utero-geſtation, by a ſmall quantity of granulated fat: this is moſt abundant behind, ſo that the peritoneum is almoſt immediately in contact with them in front. The external ſurface is tuberculated at this time: anatomiſts have ſometimes deſcribed the organ, as if the cones of tubular ſubſtance were imperfectly connected together as yet, ſo that each kidney might be regarded as an aſſemblage of ſmaller kidnies. This repreſentation is not correct; no traces of ſuch diſtinction are viſible in the interior; and the tubercles of the outſide, which correſpond to the baſes of the cones, ſeem to depend on the cortical matter being not completely developed. Some animals, as thoſe mammalia which either live in or frequent the water, have kidnies compoſed of ſmall kidnies connected by cellular ſubſtance. There is in theſe caſes a large number of cones, each ſurrounded by a ſtratum of cortical matter, and furniſhed with a calyx of its own: and theſe ſeparate pieces are only united by cellular ſubſtance. We may conceive the human kidney to be formed in this way, except that the ſeparate portions are blended into one maſs: and the diſtinction is only external even in the fœtus. A ſtructure of a deſcription quite oppoſite prevails in many other animals, particularly in all the feræ of Linnæus. The kidney in them conſiſts of a ſingle portion of tubular ſubſtance, with one papilla and calyx, and a ſingle ſtratum of cortical matter.

While the kidney retains this tuberculated exterior, the proportion of cortical matter is ſmaller than in the perfect gland; but the diſtinction between it and the tubular is well marked: the papillæ exhibit a very lively red colour. The gland at this time has conſiderable firmneſs, particularly if compared to the liver or ſpleen. The capſule is very perfectly formed, and ſeparates eaſily. The calyces, pelvis, and ureter are remarkable for their conſiderable progreſs: the latter, in particular, is nearly half as large as in the adult, in a fœtus of ſeven or eight months. Its ſize may be more accurately eſtimated if it be compared to the vas deferens, which is like a ſlender nervous thread, recognizable only by its whiteneſs.

No conſiderable change has taken place at the time of birth: although the kidnies are ſtill tuberculated, their figure is more preciſely determined, and the difference of the two conſtituent parts is ſtrongly marked. There is nothing remarkable about the pelvis or ureter. In the ſubſequent years fat is collected more abundantly about the kidnies: theſe organs, by acquiring a thicker covering of cortical matter, loſe their unequal ſurface, and gradually aſſume the form which characterizes them in the adult. The external membrane becomes more denſe, and more cloſely connected to the ſurface. The other parts experience no further change except that they partake of the general growth. In old age the kidnies become ſoft and flaccid; and the ſurrounding fat is diminiſhed in quantity. The external membrane preſents occaſionally points of a cartilaginous conſiſtence.

Phyſiology of the Kidnies.—The minute ramifications of the renal arteries, which compoſe ſo great a portion of the cortical ſubſtance of the kidnies, ſeparate from the blood the urinary fluid, which is conveyed along the tubuli uriniferi, and depoſited by their orifices in the calyces of the kidney. It then goes through the pelvis and ureter, and thus arrives at the bladder. The ſecretion goes on conſtantly, and the tranſmiſſion into the bladder is equally conſtant: for there is a continual efflux, when a catheter is placed permanently in the bladder, as alſo in thoſe examples of malformation, where the ureters open on the ſurface of the body. Ligatures placed on the ureters, or obſtructions of thoſe canals by other cauſes, as, for example, by ſtones, demonſtrate this courſe of the urine; the tubes are diſtended between the kidney and the obſtacle, and empty below.

That the urine is formed in the cortical ſubſtance of the kidney, is the amount of our knowledge concerning this part of the ſubject; the mode, in which the ſecretion takes place, is entirely unknown. This is the problem of ſecretion, towards the ſolution of which we have approached no nearer than the above general fact ſince phyſiology has been cultivated. In the preſent inſtance, indeed, it is not yet agreed whether the uriniferous tubes be continuous with the capillary arterial canals, or whether ſome organ be interpoſed between them. Hence all attempts to explain the peculiar nature of the urine from the ſtructure of the parts in which it is formed, and to ſhew how the properties of this fluid agree with the ſize, direction, curvatures, &c. of the canals, in which the ſecretion takes place, muſt be founded on grounds completely chimerical, although theſe reveries are ſanctioned by the reſpectable authority of Haller. (Element. Phyſiol. lib. 26. ſect. 4. § 5.) Another unaccountable error is committed by the ſame phyſiologiſt in his obſervations on this ſubject. He aſſerts that the urine is formed in the blood, and ſeparated only by the action of the kidney; and defends the opinion by ſtating that this fluid goes off by perſpiration, or by the ſtomach and inteſtines, when its ordinary paſſage is obſtructed. This notion is completely irreconcileable with the preſent ſtate of our knowledge concerning the chemical conſtitution of the blood and the urine; and the alleged facts, by which it is ſupported, are, to ſay the leaſt, of a ſuſpicious nature.

We may eſtabliſh, in the ſecond place, this fact; that the kidnies are the only organs in the body capable of forming urine, and that the ureters are the only paſſages by which fluids can be conveyed into the bladder. Yet both of theſe points are contrary to the opinions of ſome phyſiologiſts. When the evacuation of the urine from the body is ſtopped, ſome ſuppoſe that it is ſeparated by other organs. "It appears," ſays Haller (Elem. Phyſiol. lib. 26. ſect. 4. § 12.), "that the friction of the circulation, and the heat of the fluids produce in the blood acrid particles, tending to an alkaline nature, of which the more volatile are diſſipated by inſenſible perſpiration, while others, too large for the pores of the ſkin, can be ſeparated by the kidnies only. For, in all caſes of iſchury, where theſe particles are not ſeparated by the urine, either ſymptoms of acrimony take place in the whole body, or theſe matters are thrown off by other organs. Thus the ſweat and perſpiration have an urinous odour: or there is an urinous œdema of the whole body, or urine depoſited in the cellular ſubſtance, with violent and fatal fever. In other inſtances urine has been diſcharged by the ſalivary organs; by the ears or noſtrils, mixed with blood; by the mammæ; by vomiting, or ſtool; or it has become mixed with the fluid of the abdomen, or it has been depoſited in the brain, cauſing cephalalgia, blindneſs, delirium, ſtupor, convulſions and apoplexy. When ſecreted into the ſtomach, it cauſes hiccough and vomiting. Laſtly, the congeſtion of earthy ſubſtances in the blood, cauſed by iſchury, may produce ſandy matter in the ſweat." That a fluid, poſſeſſing ſuch very peculiar properties as the urine does, conſiſting of ſuch numerous and complicated elements, and ſeparated uſually in a very intricate glandular ſtructure, ſhould be formed alſo in almoſt every other kind of organic apparatus in the body; that it ſhould be ſeparated by the exhalants of the cellular ſubſtance, and of the ſkin, by thoſe of mucous and ſerous ſurfaces, by the veſſels of the brain, as well as by glandular organs, is a poſition ſo completely at variance with all that we underſtand of the compoſition and actions of the animal frame, that we could not receive it without very unexceptionable evidence. The whole quotation exhibits credulity rather than the deliberate caution neceſſary for eſtabliſhing ſo ſingular a fact, and the ſubjoined authorities are not at all calculated to remove our ſcruples. Perhaps an urinous odour has been ſometimes obſerved in the perſpiration; although we believe that even this has not been hitherto proved by very convincing evidence. Muſt we immediately conclude that the cutaneous exhalants have formed urine? When the biliary paſſages are obſtructed, and various fluids are tinged with bile, we explain the phenomena by the abſorption of that fluid from its natural receptacles. Will not the ſame explanation ſuffice for the caſes, if there are any ſufficiently proved, of urinous properties in the other ſecretions and exhalations of the body?

That there is ſome more direct paſſage from the alimentary canal to the bladder, than through the abſorbents, the general circulation, and the kidnies, is an opinion that has been partially entertained even from the moſt ancient times. The very rapid manner in which the urinary ſecretion is augmented by copious draughts of fluids, and the communication, within a very ſhort time, of particular properties to the urine, by certain ſubſtances taken into the ſtomach, are the circumſtances on which this opinion has been grounded. Anatomical inveſtigation has hitherto detected no ſuch paſſage; no diſſector has met with any tube that could poſſibly ſerve the purpoſe of forming ſuch a communication: while the experiment of tying the ureters corroborates this negative fact, by teaching us that no urine gains admiſſion into the bladder, when theſe tubes are obſtructed. "Galen," ſays Haller, (Elem. Phyſiol. lib. 26. ſect. 4. § 4.) "taught us long ago, that when the ureters are tied or divided in the living body, the urinary bladder is found empty, and that the animal evacuates no urine. This experiment has uniformly exhibited the ſame reſult in the hands of ſeveral very practiſed and dextrous experimenters; and Raſt lately repeated it on a dog, and found the kidnies ſweln and full of water, the papillæ dilated, the ureters enlarged above the ligature, and empty below, the bladder not containing a ſingle drop of urine." The phenomena of diſeaſe confirm the concluſions to which theſe trials lead: obſtructions of the ureters, and ſuppreſſion of the action of the kidnies, entirely ſtop the urinary diſcharge, whatever quantity of fluid the patient may drink.

This aſſertion of the exiſtence of a ſhort communication between the ſtomach or bowels and the bladder, againſt the evidence of anatomy and experiments, is founded on an aſſumption which we conſider to be highly queſtionable. We are ſo far from allowing that the abſorbents and blood-veſſels are inadequate to the explanation of the phenomena, that we believe the very reverſe to be true. We believe that the great abſorbing ſurface afforded by the alimentary canal, together with the infinite number of abſorbing veſſels, and the diameter of the thoracic duct, fully account for the conveyance of fluids into the blood; and that the large ſize of the renal arteries, which muſt circulate the whole maſs of blood through the kidnies ſeveral times in the courſe of a minute, with the great number of the uriniferous tubes, very ſatisfactorily explain the ſecretion of urine in any quantity of which we have examples. If theſe paſſages, which are obvious to our ſenſes, and large enough to allow a conſiderable quantity of fluid to paſs through them, cannot tranſmit the urine with ſufficient celerity, how ſhall we expect that a greater quantity can paſs through canals, which muſt be beyond all compariſon ſmaller, ſince no diſſector even conjectures that he has ever ſeen them? There is another and ſtill more fatal objection to theſe opinions: the fluids voided in theſe caſes are urine, of a very aqueous kind indeed, but ſtill urine;—ſtill that peculiar animal fluid, which is ſecreted only by a kidney. Now, if there be a direct paſſage from the ſtomach to the bladder, we ought to void, according to the nature of our drink, tea, wine, punch, cyder, &c. We muſt ſuppoſe, therefore, the exiſtence of an unknown kidney to convert theſe different fluids into urine, as well as of an unknown paſſage to convey them to the bladder. The exiſtence in the urine of particular properties, derived from certain articles of food, will prove nothing in this caſe, until we have been convinced that they cannot have been imported by the medium of the general circulation. Expoſure of the body to the vapour of turpentine will affect the urine, without its introduction into the ſtomach. (See the experiments under the article INTEGUMENTS.) What are the ſecret paſſages by which this is conveyed, in ſuch a caſe?

The urine is regarded as a fluid entirely excrementitious; as conſiſting of materials, which are either uſeleſs in the animal economy, or which, if retained, would be actually prejudicial. The fluids which we drink dilute the ſolid food, reduce it to that ſtate in which it conſtitutes the chyle, and are abſorbed with it. Probably a conſiderable portion is taken up immediately from the alimentary canal, without undergoing the previous change into chyle; ſince copious drinks often augment the urinary diſcharge much ſooner than the formation of chyle could be effected. The ſuperfluous fluid, thus introduced into the blood, is ſeparated by the kidnies, and very ſpeedily ſeparated, when large quantities are drunk: hence the chief component part of the urine is water. The organs of the body are conſtantly undergoing changes in their compoſition: they receive freſh particles from the blood, while the abſorbing ſyſtem removes the old ones; ſo that there is a perpetual movement over the whole body of combination and decompoſition. Again, a ſimilar change is inceſſantly carried on in the animal fluids. The lymph of the cellular texture and the ſerum of the circumſcribed cavities are at all times in this kind of circulatory motion. Theſe old materials are conveyed into the blood by the abſorbents, and ſeparated from it in the kidnies, in order to be thrown out of the body. They ſeparate it under the peculiar form denominated by the French chemiſts urée; which matter exceeds in amount by many times all the other ſaline ſubſtances diſſolved in the urine, and beſtows on that fluid its colour, odour,—in a word, all its peculiar characters. We ſhall anticipate, from this view of the matter, what the reſearches of modern chemiſtry have moſt clearly proved, that the component ingredients of urine are very numerous: it exceeds, in this reſpect, all the other animal fluids. A particular account of its ſenſible characters and chemical compoſition will be found under the article URINE; and that of the concretions occaſionally formed in the urinary paſſages under STONE.

No ſecretion exhibits ſuch ſignal variations as this: the term urine, therefore, is applied to fluids differing in almoſt every circumſtance from each other. The nature and proportion of its ingredients are not alike in the ſame individual, at the different periods of life. Peculiar characters diſtinguiſh it in the fœtus, the boy, the adult, and the old ſubject: they differ in the ſame day, according as a perſon is expoſed to heat or cold, as he is inactive or uſes much bodily exertion, according to the nature and quantity of the food and drink, and the length of time after meals at which it is voided; the ſtate of health, particularly of the ſtomach, and other digeſtive organs, and the paſſions of the mind, have alſo conſiderable influence.

The kidnies and bladder of the fœtus contain a very ſmall portion of fluid, which can hardly be deemed urine: it is almoſt entirely aqueous, rather viſcid and turbid, and has no ſmell or taſte. In the firſt years of life, the colour is not deep; the acrid and odorous properties are but ſlightly marked. As the motion of compoſition prevails, in almoſt all the organs, over that of decombination, the quantity of urée is ſmall. The earthy phoſphates, particularly that of lime, are not preſent, or in very minute quantities. While oſſification is incomplete, this ſubſtance is required for the developement of the bony ſyſtem. In the adult, where the growth of the body is complete, the reſidue of nutrition is more abundant, all the properties of the urine are more ſtrong. It contains ſalts, earthy phoſphates, phoſphoric acid, urée, and uric acid, according to the deſcription in the articles already referred to. The ſalts and the animal ſubſtance increaſe in the old ſubject; the phoſpate of lime is very abundant.

The modifications produced in the urine by heat and cold, which include alſo the effects of exerciſe, and the influence of the ſeaſons, are not the reſult of any direct action on the kidnies, but ariſe from the operations of theſe cauſes on the cutaneous functions. The relations between the urine and the external and internal exhalations are peculiar to this ſecretion. In proportion as we perſpire more abundantly, the urinary evacuation is diminiſhed; and the ſame circumſtance is obſerved in conſiderable dropſies. From this character, which belongs excluſively to the function of the kidnies, naturally ariſe the frequent variations in the quantity of the urine; while the other ſecretions are nearly always in uniform proportions. Expoſure of the ſurface to cold, or inactivity, is attended not only with an increaſed quantity of urine, but with alterations of its other properties: it is pale, not acrid, nor ſtrong in its ſmell. Warmth, with free perſpiration, or ſtrong exerciſe, diminiſhes the quantity, and renders it more highly coloured, acrimonious, and odorous. Slighter changes of an analogous nature may be remarked in winter and ſummer. (See INTEGUMENTS.) When the quantity of urine is ſo remarkably augmented in diabetes, the ſkin is parched and dry.

The quantity of food, and more particularly of drink, influences very greatly that of the urine; and ſeveral phyſiologiſts repreſent the two as nearly equal. The effect of aqueous drinks, however, will be conſiderably modified by the ſtate of the cutaneous diſcharge. If the individual be warm and ſtrong, a great part of ſuch drinks is diſſipated by the ſkin: in a weaker ſtate of the body, combined with external cold, it is diſpoſed of by the kidnies. The labourers in harveſt will often drink ſome gallons of liquor, while proſecuting their hard work under a hot ſun, without any increaſed urinary diſcharge; the perſpiration, however, is uncommonly copious, and its evaporation has a moſt favourable effect in keeping the body cool. The liquors which increaſe the urine moſt remarkably are thoſe of an aqueous kind, ſuch as water, vegetable infuſions, weak beer, cyder, &c. taken cold. Stimulating drinks, ſuch as the ſtronger wines and ſpirits, and warm fluids, excite the ſyſtem in general, and are more likely to be diſpoſed of by the ſkin. The quantity of urine, aſcertained by actual experiment, has varied conſiderably. The accounts of Hartman, Robinſon, De Gorter, Keil, Rye, Home, Sanctorius, and Linings, give us the following numbers of ounces in twenty-four hours; 28, 31, 36, 38, 40, 44, 50½, 64: the average of the whole will be 49 ounces.

The qualities of the urine are affected, in many inſtances, in a very obvious way by the nature of the food. As this ſecretion provides for the removal from the body of the reſidual and excrementitious part of our aliment, we cannot doubt that it muſt be very eſſentially influenced by the properties of the food. Rhubarb, beet root, madder, and other ſubſtances affect its colour. Fourcroy mentions a man, who conceived that he voided blood, but was perfectly free from pain, and all ſymptoms of urinary affection. He had eaten a large quantity of beet root for ſeveral days; and on leaving this off, the urine recovered its healthy appearance. (Syſt. des Connoiſſ. Chim. t. 10. p. 170.) Garlick and onions affect its ſmell; oil of turpentine gives it an odour reſembling that of violets; and aſparagus imparts to it a remarkable fetor. Several other vegetables, ſuch as fennel, carrots, parſnips, &c. produce alſo very ſenſible effects on its ſmell. A very ſtriking inſtance of change in its properties, produced by an alteration in the food, is afforded in the treatment of the diabetes mellitus by animal diet. See DIABETES.

The alteration of the urine by the food is more particularly evinced in individuals, whoſe digeſtive organs are not ſtrong: hence the ſtate of the urine is an important ſymptom in ſuch caſes.

Two or three kinds of urine are diſtinguiſhed, according to the interval between the repaſt and the time of evacuating the fluid. The firſt, diſcharged within a very ſhort time after drinking, is called urine of the drink (urina potus), or crude urine. It is often evacuated ſo ſoon after drinking, and has ſo little of the diſtinguiſhing characters of urine, that it has given riſe to the notion already mentioned of a ſhort communication between the ſtomach and bladder. It appears almoſt like a mere water, and has neither the ſmell, colour, nor weight of urine: it muſt be regarded as an extremely diluted form of the fluid, in which the urée is diffuſed in a very large proportion of water. The urine of digeſtion or concoction (urina chyli) is that evacuated two or three hours after a meal. Its colour and other urinous properties are more ſtrongly marked than in the preceding; but it is not yet perfect urine. It is affected by the nature of the food. The urine of the blood (urina ſanguinis) is voided ſeven or eight hours after eating, or in the morning after a night's ſleep. It is highly coloured and acrid, has a ſtrong taſte and ſmell, not that imparted by any particular food, but the peculiar urinous odour. The circumſtances of digeſtion and the nature of the food either do not affect this, or affect it in a much leſs degree. It contains a large proportion of ſalts and urée. Its characters, in ſhort, are thoſe deſcribed as belonging to urine; and it is always ſelected for the purpoſe of experiments on the chemical conſtitution of this fluid.

The paſſions have an influence on the nature of this fluid: fear, ſorrow, and, in general, the emotions which act violently on the frame, often cauſe an abundant flow of colourleſs and inodorous urine, which ſeems to conſiſt almoſt entirely of water.

But the effects of the cauſes which we have juſt conſidered, are very ſlight in compariſon with the changes produced by diſeaſe. The alteration in this caſe goes deeper, and the variations are more numerous and characteriſtic. Since the earlieſt ages of medicine, phyſicians have drawn indications from this ſource concerning the nature, progreſs, and termination of diſeaſes; and empirics have not overlooked ſo favourable an opportunity of levying a tax on public credulity. Careful analyſes of the various morbid urines are ſtill among thoſe deſiderata, which promiſe very intereſting reſults to the phyſiologiſt and pathologiſt. A few facts only have been collected on this ſubject. The ſediment of the urine, at the termination of acute diſeaſes, has been found to conſiſt chiefly of uric acid. The colourleſs fluid voided in nervous diſorders, in hyſteric paroxyſms, &c. is little more than mere water. Phoſphoric acid and phoſphate of lime are not found in the urine during the paroxyſm of gout; but the latter returns towards its ceſſation, and is even more abundant than in the healthy ſtate. In thoſe affections, in which the bones become ſoftened, the urine has a large proportion of phoſphate of lime: the earth abſorbed from the bones is evacuated by the kidnies. During utero-geſtation, this earthy ſalt is not found in the urine. For the remarkable qualities of this fluid in *diabetes*, ſee that article. The ſecretions of the mucous membranes, over which the urine paſſes, may variouſly modify its properties; and diſeaſes of theſe parts may occaſion the admixture of blood, pus, mucus, &c.

The laſt circumſtance we have to mention concerning the urinary ſecretion, diſtinguiſhes it from all others; *viz.* that the ſecreted fluid is concerned in no other function, but is entirely expelled from the body, after traverſing the urinary paſſages. In other inſtances the ſecreted fluids ſerve ſome office; the tears lubricate the ſurface of the eye; the action of the ſaliva in aſſiſting maſtication is very important; the bile and pancreatic juice concur in digeſtion. Hence the alterations in the quantity or qualities of theſe are followed by ſerious conſequences; while the changes of the urine, particularly in quantity, are hardly obſerved.

The *renal capſules* (capſulæ ſuprarenales, or atrabilariæ, renes ſuccenturiati) are two ſmall bodies, a right and a left, placed above the upper extremities of the kidnies, which they cover to a certain extent, and behind the peritoneum. They are ſometimes double on one or both ſides. Their ſize varies much according to the age of the ſubject: in the firſt months of fœtal exiſtence they are at leaſt as large as the kidnies, and they continue to grow until the firſt years after birth: but as this growth is much leſs rapid than that of the kidney, the proportionate ſizes of the two organs are ſoon entirely changed, and become ſuch as we find them in the adult. When they have acquired their greateſt magnitude, they ſometimes preſerve it in the adult; or they are gradually diminiſhed, and at laſt diſappear almoſt entirely. Their figure does not much reſemble any known object; it is ſomewhat triangular, and bent from above downwards. We may diſtinguiſh in them an anterior and a poſterior ſurface, a ſuperior and an inferior margin, an internal and an external extremity.

The anterior, which is alſo the broadeſt ſurface, preſents, a little above its middle, a tranſverſe groove, which receives the chief capſular vein: this correſponds, on the right ſide, to the inferior vena cava and the duodenum; on the left, to the ſpleen and pancreas. The poſterior ſurface is in contact with the ſemi-lunar ganglion and the diaphragm. The inferior edge, which from its breadth has been deſcribed as a ſurface, is excavated obliquely from before backwards, and from above downwards, and embraces the ſuperior end of the kidney. The ſuperior margin, thin and convex, is rather inclined inwards, correſponding to the liver on the right, and to the ſpleen on the left ſide. In the extremities there is nothing remarkable: the inner is rounded and rather lower than the outer, which is more pointed. The whole exterior is unequal, with an appearance of ſmall lobes, and adheres to the neighbouring parts by numerous veſſels, by nerves and by a looſe adipous ſubſtance, continuous with that which ſurrounds the kidnies. This ſubſtance in moſt caſes nearly reſembles the capſules themſelves in colour, ſo that they may be eaſily overlooked in a ſuperficial examination.

A kind of triangular cavity occupies the middle of the capſule, with an oblong eminence, cauſed by the courſe of a vein projecting into it below: the ſides of this hollow often appear united by a kind of downy matter. It contains a fluid of a reddiſh colour in the fœtus, yellow in young ſubjects, and brown in the adult. Its conſiſtence and quantity are variable; and it is coagulable by alcohol. It has been aſſerted that this cavity may be inflated by the capſular vein; but Haller could not ſucceed in attempting this in the human ſubject, although he accompliſhed it in animals. Some deny the exiſtence of a cavity, and others have aſſerted that it is a vein. Haller ſaw it clearly ſixteen times in the human ſubject: it was not obſervable in three inſtances.

The colour is a browniſh-yellow, and deepeſt in the interior: it has more of red in the fœtus and in children. The form at that time is more rounded, the volume more conſiderable, and the fluid more abundant. Their conſiſtence is moderately firm; more ſo on the outſide than in the internal portion, in the adult than in the child. They are compoſed of lobes diviſible into lobules, which may again be reduced into ſmaller portions. The ſurrounding cellular ſubſtance enters the organ and joins together theſe portions. In this reſpect the ſtructure of the renal capſules reſembles that of the conglomerate glands; but no excretory duct has been diſcovered in them.

Their arteries are numerous, and divided into ſuperior, which come from the lower diaphragmatic, middle from the aorta or cæliac artery, and inferior, which ariſe from the renal. They anaſtomoſe frequently, and ſeem to run on the ſurfaces without entering the ſubſtance of the organs. The veins are leſs complicated. There is always a large one on each ſide, produced from the inferior vena cava on the right, and from the renal vein on the left ſide. It enters the groove of the anterior ſurface, and after running through it, paſſes into the neighbouring adipous ſubſtance, and to the lower part of the diaphragm. The branches enter the ſubſtance of the capſules, but probably do not open into the cavities, as ſome have ſuppoſed.

Lymphatic veſſels ariſe from all points of theſe organs, and ſeveral join thoſe of the kidney. On the right ſide they go to ſome lymphatic glands placed round the vena cava, below the liver; or they are united with the abſorbents of the liver, and proceed with them to the thoracic duct. On the left ſide they enter glands placed in front of the left crus of the diaphragm.

The nerves of the renal capſules come from the cæliac ganglia and from the renal plexuſes.

Phyſiology of the renal Capſules.—The uſe of theſe bodies is entirely unknown: the phyſiologiſt or pathologiſt has not hitherto noticed one fact that can throw the ſmalleſt light on their office, or that can prove them to poſſeſs any connection with any function of the animal economy. "From an attentive conſideration of all circumſtances," ſays Haller (Elem. Phyſiolog. lib. xxvi. ſect. 4, § 14.) "I can venture to affirm nothing further of theſe capſules, than that they ſecrete a fluid, which is more neceſſary to the life of the fœtus than to that of the adult. I can draw nothing from comparative anatomy, except the probable conjecture, that they are made for important purpoſes, as they are found in ſo many animals. They are large, and have a large cavity in the carnivorous, as the tiger, and in ſome herbivorous animals. But in other herbivora they are ſmall, and the cavity is ſmall in the voracious ſhark."

The urinary bladder, or muſcular and membranous reſervoir for the urine, is placed at the middle and anterior part of the pelvis, behind the bones of the pubes; before the rectum in man and the uterus in woman; below the ſmall inteſtine, above the lower part of the rectum, the vaſa deferentia and veſiculæ ſeminales in man, and the vagina in woman. This is the natural ſituation of the bladder in the adult, but age and various circumſtances produce changes in this reſpect, which it is important to obſerve. In the fœtus the bladder is ſituated almoſt entirely out of the pelvis, and reaches nearly to the navel, in the midſt of the cellular ſubſtance, which occupies the lower and front part of the abdomen, externally to the peritoneum. Hence it follows, that at this age its anterior ſurface is covered by the peritoneum only at the upper part, and that in the reſt of its extent it correſponds immediately to the oſſa pubis and the recti and tranſverſi abdominis. It may accordingly be opened above the pubes, even in its empty ſtate, without wounding the peritoneum. This peculiarity of poſition ariſes from the bladder being greatly developed in proportion to the neighbouring organs, and eſpecially from its being very elongated, while the pelvis is ſmall and very ſhallow: the upper aperture moreover is very oblique, and the rectum, diſtended by a large quantity of meconium, particularly towards the latter periods of pregnancy, almoſt entirely fills the pelvis. As the cavity of the latter is developed, the bladder ſinks in it, and retires from the umbilicus. At three years of age it is ſaid to riſe hardly more than three fingers' breadth above the pubes, and at twelve this is reduced to about half an inch: at eighteen it is ſaid to be completely hidden behind the bone. Haller, however, obſerves, that he has ſeen the length of this viſcus remaining even to the time of puberty, ſo that it ſtill projected conſiderably above the pelvis. In the adult, where the pelvis is deep, and the bladder ſhorter, not exceeding the bulk of an egg in its undiſtended ſtate, it never riſes above the pubes when empty; and even at other times is generally below the upper edge of the bone. But when it contains a large quantity of urine, it aſcends and forms in the hypogaſtric region a very diſcernible tumour, which riſes and increaſes gradually, in proportion as the quantity of contained fluid becomes greater. It may reach in theſe caſes beyond the umbilicus. It is contained in the abdomen in the latter months of pregnancy. Perhaps it may be inclined rather more backwards in the ſupine poſition of the body. It has ſometimes been contained in an inguinal or vaginal hernia. Its ſituation is not always perfectly ſtraight, but ſometimes, as Celſus has obſerved, rather inclined to the left. It is retained in its ſituation by cellular ſubſtance, which ſurrounds it on all ſides, and by other means, which will be deſcribed preſently.

The capacity of the organ differs according to the age, ſex, and diſeaſes. It is much greater, in proportion to the ſize of the body, in children than in adults: it diminiſhes afterwards as it ſinks in the pelvis. It is larger in perſons who have the habit of retaining the urine for a long time, than in others; and on this account it may be larger in ſome females. In caſes of retention of urine it ſometimes is ſo enlarged as to hold ſeveral pints: and it is diminiſhed in a correſponding degree in other affections, as when it is irritated by the conſtant preſence of a ſtone, or by any other cauſe. We can hardly aſſign any particular capacity as the natural one, there is ſo much variety in different individuals: a healthy perſon may void, at one time, from half a pint or leſs to two pints.

The figure of the bladder, in an adult male, is nearly that of an oval, rather flattened from before backwards, with the large extremity placed downwards and a little backwards, and the ſmaller in the contrary direction. In females, and particularly in thoſe who have had many children, it is not ſo high, but broader in the tranſverſe direction. It is very elongated, and nearly cylindrical, in the fœtus, at which time its extremity, formed by the urachus, approaches the navel: its length is three times its breadth, and its tranſverſe diameter is nearly equal to the antero-poſterior. At no long period after birth theſe dimenſions change, the bladder becomes more rounded, and aſſumes a ſomewhat pyriform figure; and, as the child grows, the figure approaches more and more to the oval. Several anatomiſts diſtinguiſh in the bladder a ſuperior portion, which they call the fundus; a middle part, or body of the bladder; and an inferior diviſion, comprehending the lower ſurfaces and the neck. We ſhall divide the organ into two ſurfaces, an external and an internal.

The external ſurface may be naturally divided into ſix regions: *viz.* an anterior, a poſterior, a ſuperior, an inferior, and two lateral, or right and left.

The anterior, which is ſlightly inclined forwards, *is* bounded above by the urachus, and below by the neck of the bladder. At its lower part are ſeen two ſmall fibrous faſciculi, called anterior ligaments of the bladder. They have a horizontal direction, and are attached to the back of the ſymphyſis pubis in front, to the ſuperior portion of the neck of the bladder, and to the proſtate behind. This region then correſponds to the flattened poſterior ſurface of the oſſa pubis and their ſymphyſis, to which it is connected by a looſe cellular ſubſtance. When the organ is empty, or moderately filled, it does not aſcend above the bone; but in the diſtended ſtate it riſes out of the pelvis, and correſponds immediately, without the interpoſition of the peritoneum, to the abdominal muſcles. Hence, at this time it may be perforated by a trochar, or opened for the extraction of a ſtone, without expoſing the patient to an effuſion of urine in the abdominal cavity.

The poſterior ſurface, ſlightly inclined upwards, is convex, ſmooth, entirely covered by peritoneum, contiguous to the rectum in the male, and to the uterus in the female ſubject, and to the inferior convolutions of the ſmall inteſtine in both ſexes.

The lateral regions, which are broader below than above, are covered by peritoneum in their poſterior portion only: in front they are connected to the ſides of the cavity of the pelvis by a large quantity of cellular tiſſue. The umbilical arteries, and the vaſa deferentia, paſs along them.

The ſuperior region is commonly called the fundus of the bladder; it correſponds to the convolutions of the ſmall inteſtine, and affords attachment to the ſuperior ligament of the bladder. The latter is compoſed of the urachus and of the two umbilical arteries, each of which is here included in a ſmall falciform portion of peritoneum. The urachus, occupying the middle of this ligament, appears in the adult under the form of a whitiſh fibrous cord, extended from the fundus of the bladder, on the external ſurface of the peritoneum, to the umbilicus, where it is confounded with the aponeuroſes of the tranſverſe muſcles. It is about as thick as a ſmall quill at the bladder, but it grows gradually ſmaller towards the navel. It poſſeſſes no interior cavity, and ſeems capable of no other uſe than that of fixing the bladder in its ſituation. Inſtead of being ſolid and ligamentous, it is ſaid ſometimes to form a true canal, by means of which the urine eſcapes at the navel: this unuſual appearance, which we have never ſeen, is ſaid to ariſe from obſtruction at the neck of the bladder, and to ceaſe as ſoon as the urine flows through the urethra.

The elongated figure and great elevation of the bladder in the fœtus, make the urachus very ſhort; it then forms a canal, beginning from the upper part of the bladder: thence it aſcends to the umbilicus, becoming at the ſame time contracted. Laſtly, it enters this ring with the umbilical arteries, and is continued into the cord: according to Haller, it may be filled with mercury for an inch, or an inch and a half. Farther on, it is ſaid to be divided into ſeveral filaments, which are loſt on the arteries: but Mr. Cruikſhank ſtates that it is continued, in the form of a very ſlender thread, throughout the cord. In quadrupeds it is manifeſtly hollow, and paſſes through the cord to a membranous bag called the allantois, in which it ends. Its diameter is variable: in general it is not more than one-third of a line in breadth, and it opens into the bladder by an orifice, which is ſo ſmall and difficultly found, that many good anatomiſts have altogether denied its exiſtence. Sometimes it is conſiderably larger in this ſituation. Haller ſays that he has expreſſed from it a drop of gelatinous lymph, and others ſpeak of urine as contained in it. Its conſiſtence is firm; it ſeems to be formed by a prolongation of the internal coat of the bladder, incloſed by long and hard fibres continued from the muſcular coat. It is cloſed, and becomes ſolid and ligamentous ſome time before birth: its cavity is obliterated, like that of the umbilical veſſels, and it can no longer be dilated, or receive urine. Sometimes, however, it remains open: Haller introduced a hog's briſtle into it in the adult, and he mentions gravel being contained in it in another inſtance. In 1787, ſays Boyer, I diſſected the bladder of a man thirty-ſix years old, whoſe urachus formed a canal an inch and a half long, and contained twelve urinary calculi of the ſize of millet ſeeds. I aſcertained that the containing tube was not a ſacculus or elongation of the internal coat through the muſcular tunic. Theſe examples of a hollow in the urachus of the adult are very rare.

As the exiſtence of a canal in this part is ſometimes denied, we ſubjoin the following expreſs teſtimony of Haller on the ſubject. "Doubts have been entertained whether the urachus be hollow, ſince we often find that nothing paſſes into it, when the bladder is diſtended with air or mercury; and ſeveral good anatomiſts have found no canal. But the repeated inveſtigations of this matter by myſelf, and by one of my pupils, have plainly ſhewn that a foramen leading into the urachus exiſts at the top of the bladder in the human fœtus. When the ſurrounding cellular ſubſtance has been removed, and the fold, which is ſometimes formed between it and the bladder, is deſtroyed, air, quickſilver, or a briſtle will enter eaſily: I have alſo ſqueezed out a drop of gelatinous fluid, and others have found urine in the cavity. It may be demonſtrated as far as the umbilicus." Elem. Phyſiol. lib. xxv. ſect. 2.

The two umbilical arteries, which are conſtantly obliterated in the adult, form merely ligamentary cords of a cylindrical figure, placed at the ſides of the urachus, and adhering like it with tolerable firmneſs to the peritoneum.

The falciform proceſſes of the peritoneum are neceſſarily and mechanically produced by the reflexions of that membrane on the three ligamentary cords juſt deſcribed: they raiſe the membrane from the ſides of the cavity, and make it project into the abdomen in the form of three ſmall elongated folds, of which the middle ſurrounds the urachus, and the two lateral ones the umbilical arteries. They are broader below than above, and more ſtrongly marked in the fœtus than in the adult. They are united and blended at the navel, but ſeparate as they deſcend; the middle, which is vertical, and correſponds to the linea alba, terminating on the fundus of the bladder, the lateral ones, which diverge, on the ſides of the organ.

The lower region, which is alſo called the baſis of the bladder, is rather more extenſive from ſide to ſide than from before backwards. It is ſubdivided into an anterior and a poſterior portion: the former, rather more elevated than the latter, is narrow, ſhaped like a funnel, and called the neck of the bladder. It is embraced by the proſtate, and correſponds to the poſterior and inferior part of the ſymphyſis pubis. The poſterior part is large and expanded: it is bounded behind by the kind of cul-de-ſac which the peritoneum forms as it is reflected from the back of the bladder to the rectum. This part covers, in man, the veſiculæ ſeminales and vaſa deferentia, which are united to it by cellular tiſſue, cloſe in front near the proſtate, and looſer behind: in the triangular interval, ſeparating the vaſa deferentia, the ſurface of the bladder is in contact with the rectum, and connected to it by a looſe abundant cellular ſubſtance, containing fat and interſperſed with numerous blood-veſſels, particularly veins. In the female this part of the bladder correſponds to the front of the vagina. The ſides of this lower portion of the bladder are covered in both ſexes, by the levatores ani, and correſpond to the intervals between the anus and the tuberoſities of the iſchia.

The internal ſurface is poliſhed and covered by an abundant mucous ſecretion. It preſents a great number of wrinkles, more or leſs ſtrongly marked, taking various directions, and formed by the internal membrane. Theſe are very apparent when the bladder is empty and contracted, but are effaced almoſt entirely when it is dilated. They ariſe from the unequal contraction of the muſcular and mucous tunics, of which the latter poſſeſſes a much leſs degree of contractility than the former. In ſome ſubjects there are ſeen, beſides theſe wrinkles, elongated prominences, reſembling in many points the muſcular columns of the right auricle of the heart. Theſe are formed by the fibres of the muſcular coat, diſpoſed in large faſciculi, and elevating the mucous membrane ſo as to project towards the bladder. Correſponding depreſſions are left between theſe columns, which have given riſe to a particular name in French (veſſies à colonnes), diſtinguiſhing the bladders with this appearance. Beſides theſe depreſſions, there are ſometimes cells or pouches of various ſizes and number opening into the cavity. Stones may be contained in ſuch cells, and are then called encyſted.

The anterior, poſterior, and lateral regions of the internal ſurface of the bladder, preſent nothing beſides what we have juſt particularized. In the ſuperior region there is a ſmall pore in the fœtus, often ſcarcely viſible, and conſtituting the commencement of the urachus, which we have already ſpoken of. The inferior region offers to our view, in ſucceſſion from before backwards: 1ſt, the neck of the bladder; 2dly, the triangular ſpace; 3dly, the inſertion of the ureters; and, 4thly, the inferior ſurface or bottom of the bladder.

The neck of the bladder, or orifice of the urethra, is a tolerably large circular opening with thick ſides, contracted a little to form the urethra properly ſo called. It occupies the moſt depending part of the bladder in the fœtus, becauſe the bottom of the organ (basfond in French) is not developed at that time. In the adult, the neck of the bladder is rather higher than the inferior ſurface; ſo that there is a ſlight declivity from the former to the latter, directed from before backwards and from above downwards. The circular figure of the opening in the neck of the bladder is ordinarily interrupted by a fleſhy tubercle, ariſing from its lower portion, and called by Lieutaud, who firſt deſcribed it, luette veſicale, or uvula veſicæ. Its ſize varies, inſomuch that it is often ſcarcely viſible. It is ſubject to enlargement, particularly in old perſons, and then it forms an oblong tumour, rounded at its upper margin, and, by its ſituation, rendering the expulſion of the urine difficult. However, we ſometimes find it ſwoln in the dead body when the bladder has not been diſtended. It ſeems to be chiefly formed by the internal membrane of the bladder, and to be merely the termination of the anterior angle of the triangular ſpace. It is deſcribed by Mr. Home, in a paper contained in the Philoſophical Tranſactions, as a third lobe of the proſtate gland. (See the deſcription of that gland in the article GENERATION.) In the natural ſtate, the neck of the bladder is cloſed, except during micturition; and is only opened for the evacuation of the urine. It is ſurrounded externally by the proſtate gland. (See GENERATION.) The opening is larger in the female; where, if it depended on the proſtate, we ſhould not expect to find a luette veſicale: yet Lieutaud aſcribes it equally to that ſex.

The trigonum veſicæ (trigone veſicale in French) is a triangular portion, bounded by three openings, which mark its three angles. Theſe apertures are diſtant from each other about an inch, or an inch and a half, and are, in front, the opening of the urethra already deſcribed, which forms the apex of the triangle; behind and laterally, the openings of the two ureters. The ſurface is a little inclined backwards, and juſt prominent enough to allow of the fact being obſerved. It is much leſs wrinkled than other parts of the bladder, and may alſo be diſtinguiſhed by its colour, which is not the ſame in all ſubjects, but conſtantly different from that of the reſt of the organ, and generally whiter. The anterior angle, or apex, which is confounded with the luette veſicale, is nearly three or four times its thickneſs; it grows thinner towards the baſis. Its thickneſs and colour, and the ſtrong adheſion of the internal membrane, lead us to ſuppoſe that its organization is peculiar. It preſerves nearly the ſame extent in the contracted bladder, and is then more prominent. It is more extenſive in the female than in the male bladder.

The openings of the ureters, occupying the two poſterior angles of the triangular ſpace, are narrow, elongated, and directed obliquely forwards and inwards. Their diameter is much ſmaller than that of the ureters, and they often appear to be covered by ſmall folds of the internal membrane, which it is neceſſary to elevate with a probe in order to ſee them clearly. The introduction of the probe ſhews us the obliquity of the canals, and the extent of their courſe between the two coats of the bladder, a point which we have already mentioned in ſpeaking of the ureters.

The bottom of the bladder is a large hollow ſituated behind the triangular ſpace, and below the level of the neck: it is, in fact, the moſt depending part of the organ.

The ſides of the bladder become thicker in proportion as the organ contracts, and they are rendered thinner when it is dilated. They conſiſt of a ſerous, a muſcular, and a mucous coat.

The firſt of theſe inveſts only the poſterior region, and a ſmall portion of the lateral regions. In the fœtus it covers alſo a ſmall part of the front and upper portion of the organ. Its external ſurface is perfectly ſmooth, and moiſtened by a ſerous ſecretion. The internal ſurface is connected to the muſcular covering, by cellular ſubſtance, in ſuch a way as to admit with tolerable facility of ſeparation by diſſection. This covering is furniſhed by the peritoneum, which paſſes from the front of the abdominal cavity, that is, from the recti muſcles or the oſſa pubis, to the fundus of the bladder, then deſcends over the poſterior to the inferior ſurface of the organ. Here it quits the bladder, and paſſes to the front of the rectum in men, to the anterior ſurface of the uterus in women. As it goes from one to the other of theſe organs, it forms on the ſides the two folds improperly called poſterior ligaments of the bladder, and in the middle a cul-de-ſac, which is the loweſt portion of the peritoneal cavity in the male ſubject. This part may become diſtended with the fluid of aſcites; and, as the cul-de-ſac juſt mentioned extends to within two or three inches of the anus in many ſubjects, the paracenteſis of the abdomen might be performed, in the male ſubject, from the rectum; indeed this has been actually done in one inſtance. The cul-de-ſac formed in the female, by the reflexion of the peritoneum from the vagina to the rectum, would allow a ſimilar operation, in that ſex, from the poſterior part of the lower ſurface of the vagina.

Where this ſerous covering does not exiſt, the bladder is covered by a layer of cellular tiſſue, the thickneſs and appearance of which are not every where uniform. At the anterior region, behind the pubes, and on the lateral regions, it is very looſe and abundant, and uſually contains more or leſs fat. At the inferior ſurface it is leſs copious, but ſtill looſe, and containing little or no fat; a conſiderable number of veſſels, particularly veins, is ſeen here. It is denſe and whitiſh about the veſiculæ ſeminales and proſtate.

The muſcular coat ſurrounds the bladder at all points; correſponding, by its external ſurface, to the ſerous tunic, and to the cellular ſubſtance; by its internal ſurface, to the outſide of the mucous coat. It is compoſed of a thin ſtratum of pale fibres, diſpoſed in faſciculi of various ſizes, croſſing each other in all directions, ſo as to form a very cloſe network, of which the interſtices preſent every variety of ſize and figure. Ordinarily the mucous coat is completely covered by this muſcular tunic; but ſometimes there are ſmall ſpaces without any muſcular covering. Through ſuch ſpaces the mucous membrane may be protruded, ſo as to form the cells already mentioned, communicating with the cavity of the bladder.

An attentive examination of the muſcular fibres ſhews us, that ſome have a longitudinal, others a nearly circular direction; that ſeveral are oblique, and that the reſt compoſe an inextricable network. The longitudinal fibres, forming the exterior ſtratum, are directed from the neck to the fundus of the bladder. The anterior ones ariſe from the proſtate and its covering, and ſometimes from the poſterior and inferior part of the pubes, and the front ligaments of the bladder; in the female, from the point of union of the bladder with the urethra; they aſcend over the front of the organ to its upper part, and afford to the urachus the external covering already mentioned. The poſterior fibres form more numerous and larger faſciculi than the anterior: they paſs from the urachus, over the poſterior and inferior ſurfaces, to the proſtate in man, and to the junction of the bladder and vagina in woman. Both theſe portions ſend off fibres laterally, which cover the lateral regions, decuſſate with each other, and with thoſe of the more deeply-ſeated ſtrata. As all theſe fibres have their fixed points in the proſtate and neck of the bladder, they will draw the other parts of the organ, which are all more or leſs moveable, to the neck, and conſequently preſs the urine againſt the orifice of the urethra.

The oblique fibres are leſs diſtinct and more deeply-ſeated than the longitudinal; and are ſo blended with the others that it is almoſt impoſſible to obſerve any order in their diſtribution. Some have a tranſverſe direction, and embrace the bladder almoſt in a circular manner: the more deeply-ſeated they are, the more they approach to this courſe; yet ſeveral longitudinal faſciculi may be ſeen in the interior of the organ. The contraction of theſe fibres diminiſhes the capacity of the organ in all its diameters, and tends to bring its ſides in all directions towards their common centre. The urine, thus forced on all ſides, will eſcape in the direction where there is the leaſt reſiſtance; that is, the neck of the bladder, againſt which it is moreover forced by the contraction of the longitudinal fibres.

From its office of expelling the urine, the muſcular coat of the bladder is frequently deſcribed as a muſcle, under the name of detruſor urinæ. It will be readily underſtood, from the account which we have juſt given of its action, that the bladder is brought into a flattened ſtate, and lies wholly juſt behind the pubes, when this covering has contracted. The fixed point of the organ is behind thoſe bones; the proſtate and neck cannot move, and all the other parts are drawn towards them. In this ſtate the organ is flattened before and behind, and has a triangular outline; the fundus forms the apex, the inferior ſurface the baſis, and the lateral regions the two ſides of the triangle.

In a diſtended bladder, the muſcular coat is thickeſt at the inferior ſurface and at the baſis; in other ſituations it is often remarkably thinner. This difference ariſes from the circumſtance, that the coats do not yield equally to diſtention in all directions; for, when we divide a contracted bladder, the thickneſs is nearly uniform throughout.

The deſcription of the muſcular fibres about the neck of the bladder is ſtated very differently by different writers. Some admit, and others deny the exiſtence of a ſphincter veſicæ, or circular muſcle ſurrounding the opening, and cloſing it by its contraction. The fibres in this ſituation are pale, and mixed with ſeveral veins and cellular texture; they are certainly completely continuous on all ſides with the reſt of the muſcular coat. It is obſerved by Haller, that a ſphincter was aſſigned to the bladder, in the firſt inſtance, from the ſuppoſed neceſſity of ſuch a ſtructure to account for the functions, rather than from actual diſſection; hence Veſalius places it in front of the proſtate. Santorini could find no circular fibres ſurrounding the mouth of the urethra. Others reject altogether the notion of a ſphincter; and Winſlow refers the deſcriptions of ſuch a part to faſciculi ariſing from the pubes. Haller gives the following deſcription from his own diſſections. In men there are tranſverſe and even arched fibres above, intricately connected together, and lying on the neck of the bladder, on the proſtate, and on the longitudinal fibres ariſing from the pubes. Others of an arched form, with the concavity towards the bladder, lie under theſe. In women he found fibres at the anterior part decuſſating at conſiderable angles, ſo as to form a kind of circle; in other inſtances they were more tranſverſe. The inferior fibres are tranſverſe, continuous with the circular ſtratum of the bladder, and covered by the proſtate. The effect of the contraction of theſe fibres, however ſlender and obſcure they may be, muſt be that of contracting the opening about which they are placed.

The modern French anatomiſts will not allow the fibrous ſubſtance about the neck of the bladder to be of a muſcular nature. "When the neck of the bladder," ſays Boyer, "is attentively diſſected, we find under the external cellular ſtratum, and between that and the mucous membrane, only a whitiſh, thick, firm, and fibrous ſubſtance, continuous with the muſcular coat, the fibres of which very manifeſtly end in it. There is no ſphincter, ſince we ſee no diſtinct muſcle, and the fibres of the neck are moreover continued with thoſe of the general muſcular coat. But the ſtructure, which we have juſt deſcribed, communicates to the neck of the bladder a reſiſting power, which, although not produced by the action of any particular muſcle, is ſtill ſuperior to the contractile tendency of the bladder." Traité complet. d'Anat. t. 4. p. 490.

The muſcular coat of the bladder is proportionally thicker in the fœtus and child, than in the adult. The irritability of the organ, and the force exerted in expelling its contents, ſeem to be greater in the early years of life.

The name of nervous coat has been given to a whitiſh ſtratum, placed between the muſcular and mucous coats. The ſtructure of this is completely cellular; it is looſer towards the former, and more cloſe towards the latter of the tunics. It is very extenſible, and recovers itſelf after diſtention, forming, in conjunction with the mucous membrane, the folds which we have deſcribed in the inner ſurface of the organ. It contributes conſiderably to the ſolidity of the ſides of the bladder.

The internal or mucous coat lines the whole interior. It is continuous on one ſide, with the linings of the ureters; and on the other, with that of the urethra. To its external ſurface adheres the cellular ſtratum juſt deſcribed. Internally it is perfectly ſmooth, having no viſible villi, nor any other inequalities except the rugæ which ariſe from contraction of the muſcular coat. Its ſurface is conſtantly covered by a mucous fluid, deſtined, in the opinion of phyſiologiſts, to protect it from the irritating qualities of the urine. This ſecretion muſt be perpetually removed by the urine and perpetually renewed. It is expelled in that fluid, and becomes ſenſible by chemical analyſis. When any cauſe of irritation affects the bladder, as for example, when a calculus is contained in it, this mucus is voided in very large quantities, to the amount of ſome ounces at each time of making water: in ſuch caſes it often ſubſides and concretes into a tolerably firm jelly.

The ſources of this ſecretion cannot be eaſily demonſtrated; although, as Haller obſerves, the glands of the bladder are mentioned as familiarly as if they were viſible on ſuperficial inſpection. Is the mucus poured out by the exhalants of the internal membrane, or ſecreted in a glandular apparatus? Sometimes, but rarely, ſays Haller, have I ſeen ſimple follicles on the external ſurface of the mucous coat, chiefly near the neck of the bladder; ſome round, like thoſe of the cheeks, equal in ſize to millet ſeeds, and in cluſters in the female, others ſmaller. At other times I ſaw no follicles, but mere pores." Element. Phyſiol. lib. 26. ſect. 2.

The mucous membrane is thin and whitiſh, particularly towards the neck of the bladder; in other parts it has a ſomewhat red tint. We do not know much of its organization or properties. It is continuous, through the urethra, with the epidermis, and ſeems to reſemble that part in being occaſionally detached in ſhreds, and renewed.

A whitiſh eminence is continued from the ureter on each ſide towards the mouth of the urethra, and ſometimes ſeems connected to the verumontanum. It is a firm ſubſtance, connected to the mucous membrane, and it forms the trigonum veſicæ already deſcribed. According to Haller and Morgagni, theſe riſings are not conſtant.

The arteries of the bladder are derived chiefly from the umbilical; ſome ſmall ones come from other branches of the internal iliac. The epigaſtric ſends twigs towards the fundus. They anaſtomoſe together, and form an elegant network between the muſcular and mucous coats, extending alſo into the latter. The veins, following the diviſions of the arteries, terminate on each ſide in the obturator and internal iliac veins. They ramify chiefly on the lateral and inferior regions of the organ, where they form, together with thoſe of the rectum, a conſiderable plexus.

The lymphatics ariſe from all points of the internal ſurface, and generally follow the blood-veſſels. They go through ſmall glands in the courſe of the umbilical arteries, and end in the hypogaſtric plexus.

The nerves come from the ſacral and from the great ſympathetic.

The urethra of the male has been deſcribed in the article GENERATION; we muſt inſert in this place an account of that canal in the female. It is about an inch or a little more in length, but much larger and more ſuſceptible of dilatation than in man. Its ſhortneſs and large diameter enable it to tranſmit ſtones of a conſiderable ſize; conſequently, the operation of lithotomy is much leſs frequently performed on females than on males; and the former ſuffer, on the whole, much leſs from calculous complaints. It has been enlarged by ſponge tents ſufficiently to admit the finger and thumb. Its direction is nearly horizontal from the neck of the bladder, at which it begins, under the pubes and clitoris to the pudenda; but it deſcribes a very ſlight curve, of which the concavity is turned upwards, and the convexity downwards. It correſponds above to the corpus cavernoſum of the clitoris, adhering to it by a looſe cellular ſubſtance.

Below it is very cloſely connected to the vagina, particularly in front, and forms a longitudinal projection, which is ſufficiently conſpicuous on the front of the canal. The anterior extremity is ſituated rather lower than the poſterior, and terminates by an opening, called the meatus urinarius, at the lower part of the triangular ſpace included between the nymphæ, and juſt on the front edge of the entrance into the vagina. This aperture, which is ſometimes as large as the urethra, which it terminates, ſometimes ſmaller, is irregularly rounded, and has a thick prominent margin, exhibiting the excretory ducts of certain mucous glands ſituated in the neighbourhood. In pregnancy, particularly towards the latter months, the meatus urinarius is rather drawn inwards, and not to be diſcovered without difficulty.

The ſtructure of the canal is analogous to that of the male urethra. Externally it is covered by a thick layer of cellular and vaſcular matter, the nature of which has not been clearly aſcertained, bearing conſiderable reſemblance on a ſection to the vaſcular texture round the male urethra. This is not confined by any proper covering, as in the male, but is connected by looſe cellular ſubſtance to the ſurrounding parts. At the front, the urethra and vagina are nearly conſolidated into one ſubſtance, and are covered by a common layer of convoluted veins, called the plexus retiformis. The internal ſurface of the urethra is lined by a thin mucous membrane, continuous at one end with that of the bladder, and at the other with the lining of the pudenda. It is marked by five or ſix longitudinal lines, in the intervals of which mucous lacunæ open in rows. There may be from four to ſeven orifices in each of the grooves, leading to canals, which are continued obliquely into the ſpongy texture of the urethra, and capable of receiving briſtles. On the tumid edge of the meatus urinarius two very large ſinuſes open, capable of admitting the end of a probe. The ſtructure of theſe organs reſembles entirely that of the lacunæ in the male urethra. The mucous fluid ſecreted by them defends the ſurface of the urethra from the irritation of the urine: it ſeems alſo to be poured out more particularly in coition, or under the influence of ſtrong deſires.

Beſides the difference of length and ſize in the urethra of the two ſexes, ariſing out of the additional function belonging to this canal in the male, of conveying the fecundating fluid into the vagina, the want of proſtate in the female is another remarkable diſtinction. There is no foundation whatever for the opinion of De Graaf concerning the female proſtate.

Functions of the Urinary Bladder.—The urine ſecreted, as we have already obſerved, inceſſantly by the kidnies, is tranſmitted, without interruption, through the ureters into the bladder, retained there for a certain length of time, and then expelled by an operation under the controul of the will. The bladder, in its empty ſtate, occupies a very ſmall ſpace, is concealed entirely within the pelvis, and has its relations to the ſurrounding organs reduced within a ſmall extent. Its contracted coats are thick, but all of them are not equally concerned in producing this ſtate of the organ. The ſerous coat, and the cellular layer, have nothing to do with it; and the mucous membrane, incapable of a quick and conſiderable contraction, forms the numerous wrinkles of the internal ſurface, which may be ſeen both in living animals, and in the dead ſubject. The continued contraction of the muſcular covering produces the ſtate in which the empty bladder is found; and if its coats at this time are thicker than thoſe of the ſtomach and inteſtines; it is becauſe the muſcular fibres are ſtronger and more abundant. At this time there is, properly ſpeaking, no cavity of the bladder. The urine, depoſited drop by drop, dilates the organ inſenſibly, and makes it contract new relations to the ſurrounding parts. Although this diſtention takes place in every direction, except towards the front, it is moſt ſenſible in the long diameter, or from below upwards. Its baſis preſſes on the rectum in man, and the vagina in woman; but the natural limits which the connections of theſe parts offer, prevent it from extending much downwards. In the oppoſite direction there is no obſtacle to prevent its enlargement: it riſes freely above the pubes, the muſcular coat is diſtended, the wrinkles of the mucous membrane are effaced, and the whole organ is conſequently rendered thinner.

The peculiar conformation of the ureters, at their entrance into the bladder, accounts for the urine not returning along theſe canals to the kidney. When the bladder is diſtended with urine or air, the ureters are compreſſed between the mucous and muſcular coats, in that portion which is included between theſe coverings: and the obſtacle becomes more complete, in proportion as the diſtention of the bladder is increaſed. This mechaniſm does not depend on any vital properties: you may throw air or any fluid into the dead bladder, through the urethra, but not a drop will gain admiſſion into the ureters; force the injection, and the bladder will burſt. Hence, when the urethra is impervious during life, and the bladder is diſtended far beyond its uſual dimenſions, the ureters are continually adding to the collection, ſtretching the organ ſo as to produce moſt ſevere pains, and ultimately cauſing rupture. If the muſcular covering be diſſected away, fluids eſcape immediately.

Thus, we have no difficulty in explaining why no urine paſſes in a retrograde courſe into the ureters: but the cauſe, which prevents it from entering the urethra, is not equally obvious. Although this be the natural courſe, the urinary fluid does not paſs conſtantly through the urethra, as it does through the ureters: it is retained for a conſiderable time, both in man and in quadrupeds, and never eſcapes ſpontaneouſly, in either inſtance, in the healthy ſtate. After a certain delay, a ſenſe of inconvenience and pain produces a voluntary muſcular exertion, by which it is expelled. As there is an uninterrupted flow of urine into the bladder, why does it not conſtantly eſcape? The voluntary act, by which we ſuddenly interrupt the ſtream in micturition, or reſiſt an urgent deſire to void the urine, is manifeſtly the contraction of the accelerator, which cloſes the bulb of the urethra, and conſequently intercepts the communication between the bladder and the front of the canal. But we inquire the cauſe which acts perpetually, not only independently of the will, but when we are not attending, even when we are aſleep, in preventing the urine from flowing guttatim through the urethra, as it arrives from the ureters. It is the more intereſting to diſcover this cauſe, ſince there ſeems to be in the bladder a natural tendency to contraction, in virtue of its irritable powers. Hence, where a direct opening is made into its cavity, when the reſiſting power of the neck is deſtroyed by paralyſis, or when an open catheter is left in the urethra, the urine eſcapes conſtantly as it is ſecreted, and no accumulation takes place in the bladder. The effect cannot be produced by a ſphincter, obedient to the action of the will, becauſe it takes place in an infant unconſcious of the uſages of ſociety and the laws of decorum, and in an animal which has never been trained to cleanlineſs. Both expel the urine at intervals, and in obedience to a ſtimulus, which ſeems to be the natural motive of the act. Moreover, the evacuation is ſo far from being ſpontaneous, that it requires a conſiderable effort.

Phyſiologiſts have commonly referred the cloſing of the urethra to the ſphincter veſicæ muſcle, and have conſidered it analogous, in every reſpect, to the ſphincter ani. But this is unſatisfactory, when the very exiſtence of the part, as a muſcle, is queſtioned. To the action of this, which he acknowledges to be inadequate to the effect, Haller joins the relative poſition of the bladder and urethra. He obſerves, that the inferior portion of the receptacle deſcends below the level of the urethra, and may conſequently be dilated without the urine running off through that opening; and that a greater portion of the bladder is ſo placed when the organ is diſtended. Hence, he adds, the bladder may be diſtended, in ſome degree, in the dead ſubject, before its contents will eſcape by the urethra. The French anatomiſts ſeem to be of opinion that there is ſome peculiar contractile and reſiſting power in the neck of the bladder: this is termed in the Anatomie Deſcriptive of Bichat, "le reſſort ou la reſiſtance organique du col:" t. v. p. 157. Boyer ſpeaks of the "habitual contraction of the fibres ſurrounding the neck of the bladder, and the elaſtic force of the neck and proſtate." Traité complet d'Anat. t. iv. p. 493.

We do not pretend to explain clearly the exact mode in which this buſineſs is effected. We ſee no ſphincter muſcle adequate to the purpoſe, and the circumſtance noticed by Haller will not at all account for the retention of the urine until the fundus of the bladder has aſcended far into the abdomen. We muſt be contented to recognize the exiſtence, without knowing the nature of a powerful contractile property in the neck of the bladder, retaining the urine, in ordinary circumſtances, until the ſenſe of inconvenience induces us to make the requiſite voluntary exertion for its evacuation, and, in paralyſis of the muſcular coat, and other ſtates of diſeaſe, holding it until the bladder, enormouſly diſtended, ſphacelates and burſts. The advantages of this arrangement, in enabling us to retain the urinary ſecretion, until it has accumulated in conſidereble quantity, and in ſecuring us from the fetor, excoriation, and other annoyances, which a conſtant involuntary flow of urine produces, are too obvious to need a more particular detail.

Does the retention of the urine in the bladder produce any alteration in its qualities? Phyſiologiſts generally believe that the water is partly abſorbed. The urine voided at different times poſſeſſes, as we have already remarked, very different properties: if, after emptying the bladder, we make water again in a ſhort time, it is almoſt colourleſs and inodorous; allow a long time to elapſe, and it will be high coloured, acrid, and have a ſtrong ſmell. The latter properties particularly characterize what is voided after a night's ſleep. Theſe circumſtances are moſt eaſily explained by the agency of the lymphatics. The admixture of ſecretions from the ſurface of the bladder is another important ſource of modifications in the urine, particularly when the organ is irritated or diſeaſed.

The increaſe in the quantity of urine accumulated in the bladder produces an unpleaſant feeling, which ſoon amounts to pain, and ends, if the cauſe continues, in the moſt excruciating agonies. Many circumſtances influence the length of time, during which the urine is retained, and the quantity that may be accumulated before the deſire to expel it is felt. The qualities of the fluid, as being more or leſs irritating, and the quantity ſecreted in a given time, produce conſiderable differences: a much larger quantity can be retained, when introduced gradually, than when ſecreted very faſt. Habit has conſiderable influence; and hence women, from the uſages of ſociety, can generally ſupport a greater diſtention than men. The bladder itſelf, without any diſeaſe, varies in its retentive power in the ſame individual, according to his ſtate of health: the effect of age is alſo very perceptible: the irritable bladder of the child empties itſelf very frequently; in advanced age the contrary is obſerved. But the effects of diſeaſe are more obvious and important; in paralyſis, diſtention produces no feeling, and the natural ſtimulus to evacuation does not take place. When the organ is affected by any irritating cauſe, as the preſence of a ſtone, it will hardly bear a few drops of fluid.

The evacuation of the bladder is the joint effect of two powers; *viz.* the action of the reſpiratory muſcles, and that of the muſcular coat of the organ. By the firſt we overcome the reſiſtance of the neck of the bladder; and the operation is finiſhed by the ſecond. We begin, as in all ſimilar efforts, by a deep inſpiration; then, retaining this air in the cheſt, we exert alſo the abdominal muſcles. The perpendicular poſition of the body ſubjects the bladder, in the moſt favourable way, to the downward preſſure of the diaphragm: the buſineſs is accompliſhed more difficultly in the recumbent poſture. The effort is always greater in proportion to the diſtention of the bladder: when the quantity of urine is ſmall, the exertion may be ſlight; but inſpiration in all caſes precedes micturition. A few drops, or a very ſlender ſtream, come through the urethra firſt, proving that the orifice of the bladder is very completely cloſed in the healthy ſtate. It then comes in a larger and larger current, and with increaſing force; being propelled further in young than in old ſubjects. When it flows in a full ſtream, we remit the effort with which the operation began, and continue reſpiration in the ordinary manner: the proceſs is completed by the powers of the bladder, which force out its contents in a continuous ſtream. We may ſtill increaſe the impetus by renewing the effort; or we may project a portion of the fluid more forcibly by the aſſiſtance of the accelerator urinæ muſcle. Perhaps the contraction of the bladder is the moſt important circumſtance in the operation; for, when that is paralyſed, we put the reſpiratory powers in action without effect. Diſtention of the organ very much weakens its expulſive power; ſo that, when we have retained the urine beyond the proper time, we exert the abdominal muſcles and diaphragm very violently for a conſiderable time without effect.

Towards the end of micturition, the urine again flows guttatim, as at the beginning; and the laſt portions are thrown into the urethra with ſo feeble an effort, that they muſt be expelled from that tube by the accelerator urinæ.

Kidneys, *Inflammation of.* See Nephritis.

Kidneys, *Calculus in.* See Nephralgia.

Kidneys *of Birds and Fiſhes.* See *Anatomy of* Birds, and Fish.

Kidney-*bean*, in *Gardening*, a common name which is often applied to a particular ſort of bean. See Phaseolus.

Kidney-*bean Tree*, the common name of a particular kind of tree. See Glycine.

Kidney-*vetch*, the common name of a peculiar ſort of vetch. See Anthyllis.

KIDONIA, or Cidonia, in *Geography*, a province of Crete, or Candia, which has retained the name of the ancient city of the Cretans, produces oil, grain, cotton, flax, ſilk, honey, wax, ſome fruits, and a tolerably large quantity of cheeſe: its territory is in general extremely fertile. The neareſt mountains which lie to the ſouth, being more temperate and more cool than the territory of Canea, yield a great many fruits; but little wine, much oil, and ſome wheat and barley are produced in this province. See Candia.

KIDWELLY, or Cidwelly, a market town and pariſh of Caermarthenſhire, South Wales, is ſeated on the banks of the river Gwandraeth, over which is a bridge, connecting two portions of the town called the new and old town. In the year 1800, the pariſh contained 333 houſes and 1388 inhabitants. Kidwelly has been for many ages a town of conſiderable traffic. "Its harbours were ſo well frequented as to render it the rival to Caermarthen; the fiſheries of this port were conſiderable; its coal trade great, and it had beſides a flouriſhing internal buſineſs in the clothing line. But the conditon of the place has been for years on the decline. By virtue of its charter, the affairs of the town are regulated by a mayor, who is choſen annually. About the middle of the ſixteenth century, Leland ſpeaks of Caermarthen having increaſed in conſequence of the decay of Kidwelly harbour, the entrance of which became ſuddenly intercepted by a dangerous ſand-bank, driven up by the ſea, that prevented veſſels of large burden from ſailing up the river as before. It is worthy of remark, that this bar of ſand, after lying ſo long in the ſituation above-mentioned, as to almoſt ruin the Kidwelly port, ſeparated, a few years back, of its own accord, in the middle, and now affords a ſufficient depth of water for the veſſels commonly employed in the trade of this part of the country to come up the river. The old town, in the time of Leland, was nearly deſolated, but the walls ſurrounding it appears, from his words, to have been entire, for he tells us, this part was "pretily waulid," and that he ſaw "three gates ther." The old town is at preſent inconſiderable." The caſtle, at one extremity of it, ſtands proudly elevated on an artificial mount, on the ſide of the marſhes. It is allowed to be the moſt perfect building of the kind in Wales, and, according to Mr. Donovan, "is certainly a magnificent remain of ancient military architecture. There is an air of ſolemn majeſty in its appearance, that beſpeaks a noble origin." In the ſame author's "Deſcriptive Excurſions," is a print of this caſtle, and a long note on the hiſtory of the building controverts the aſſertions of Camden, Buck, and Groſe, who affirm that "Kidwelly caſtle was built ſoon after the conqueſt by Maurice de Londres, one of the Norman knights, who conquered Glamorganſhire." Inſtead of this, Mr. Donovan ſays it was built in 1189, by Rhys, Prince of Wales. Since that time it has undergone various alterations and enlargements. The preſent remains are carefully preſerved from "every ſpecies of wanton depredation." The ground plan is nearly quadrangular, with four round towers at the angles; and ſmaller towers in the walls. At the weſt end is the chief entrance, between two other round towers. Several of the apartments are nearly perfect. The proſpects from the ſummit "are uncommonly fine."

Near the church, in the new town, was a priory, or cell of Black monks. Donovan's "Deſcriptive Excurſions through South Wales," 2 vols. 8vo. 1805.

KIE, or KIEH, a town of Perſia, in the province of Mekran; 100 miles N.N.E. of Kidge. N. lat. 27° 40′. E. long. 60° 8.

KIEKERNES, a town of Pruſſia, in the province of Jamland, ſituated on an iſland in the Ruſs; 19 miles N.W. of Tilſit.

KIEL, a town of Sweden, in the lapmark of Aſele; 55 miles S.S.E. of Aſele.

KIEL, a town of the duchy of Holſtein, ſituated at the bottom of a bay or gulf in the Baltic, and forming a convenient harbour. It contains 800 houſes, three churches, an univerſity founded in the year 1650 by Chriſtian Albert, duke of Holſtein-Gottorp, and conſiderably enlarged by the late king. It contains 24 profeſſors, and when Mr. Coxe viſited it about 300 ſtudents. It has alſo a college eſtabliſhed in 1768. The proſperity of this place very much depends upon an annual reſort to it of the nobility and perſons of wealth in Holſtein and Sleſwick, for the transfer and diſpoſal of their monies; this pecuniary intercourſe uſually laſted eight days, at which time was held a conſiderable fair, which commenced by the ringing of a bell on Twelfth-day, and terminated in the ſame manner on the eve of the Purification. It was formerly one of the Hanſe towns, and the ſtaple for all goods exported from or imported to Denmark. The diſtrict of Kiel is that portion of the duchy of Holſtein, which deſcended to the line of Holſtein-Gottorp, and belonged to Peter III. as part of his hereditary dominions. In 1773, the empreſs of Ruſſia ceded it to the king of Denmark, in exchange for the counties of Oldenburgh and Delmenhorſt, which ſhe gave to the prince biſhop of Lubec. This exchange was favourable to Denmark, as it poſſeſſed the whole duchy of Holſtein. For an account of the canal of Kiel, ſee CANAL.

KIEL, *Lake of*, a lake of Norway, in the province of Chriſtanſand; 16 miles N. of Chriſtanſand.

KIELEE, or KIALTZE, a town of Auſtrian Poland, in the palatinate of Sandomirz, the ſee of a biſhop; 24 miles E. of Malagoez.

KIELO, a town of Perſia, in the province of Irak; 35 miles N.E. of Sultania.

KIEMI. See KEMI.

KIEN, a town on the E. coaſt of the iſland of Ceram, one of the Molucca iſlands.

KIENG-HIEVER, a town of Perſia, in the province of Irak; 39 miles S.S.W. of Hamadan.

KIEN-NING, a city of China, of the firſt claſs, in the province of Fo-kien. To its diſtrict belong eight cities of the third claſs. It is ſituated on the river Minho, which renders it a place of conſiderable trade. At the time of the conqueſt of China by the Tartars, this city ſuſtained two ſieges, and refuſed to ſubmit to the power of the conqueror; but ſome time after it was taken, and all the inhabitants were put to the ſword. It was afterwards re-eſtabliſhed by the Tartars, who deſtroyed it. N. lat. 27° 5′. E. long. 117° 2′.

KIEN-TCHANG, a city of China, of the firſt claſs, in the province of Kiang-ſi, ſituated on the frontiers of the province of Fo-kien. It has five cities under its juriſdiction. In the adjacent country, which is fertile, the common rice is uſed in making wine, and a reddiſh ſort is uſed by the richer people for food. N. lat. 27° 35′. E. long. 118° 20′.

KIEOU-CARPOU, a town of Corea; 500 miles E.N.E. of Peking.

KIEOU-KIANG, a town of China, of the firſt claſs, in the province of Kiang-ſi, ſituated on the S. ſide of the river Yang-tſe-kiang, or Kian-ku; it has five cities under its juriſdiction. This city is the rendezvous of all the barks which paſs and repaſs from the other cities of this province, and the provinces of Kiang-nan and Hou-quang. Although it is 300 miles diſtant from the ſea, ſalmon, dolphins, and ſturgeon are taken in its river; which ebbs and flows every new and full moon. N. lat. 29° 53′. E. long. 115° 41′.

KIERADY, a town of Hindooſtan, in Benares; 15 miles E.S.E. of Chunar.

KIERALI, a town of Turkiſh Armenia, on the coaſt of the Black ſea, at the mouth of a river of the ſame name; 30 miles S.W. of Trebiſond.

KIERE, a town of Perſia, in the province of Irak; 20 miles S.E. of Caſbin.

KIERNOW, a town of Ruſſian Lithuania; 25 miles N.W. of Wilna.

KIERTEMINDE, a ſea-port town of Denmark, in the iſland of Funen, on the ſide of a large bay. The merchants of Odenſee have warehouſes in this town; eight miles E.N.E. of Odenſee. N. lat. 55° 22′. E. long. 10° 40′.

KIESELSCHIEFER, in *Mineralogy*, a ſpecies of ſtone, which, according to Werner, comprehends the two following ſubſpecies, *viz.* the *Siliceous ſchiſtus* of Kirwan, and the *baſanite* of the ſame author. The principal colour of the former is aſh-grey, blueiſh or greeniſh-grey, with occaſional ſpots or ſtripes of red, and is often croſſed by veins of quartz. It occurs in maſs, forming whole beds, or in ſmooth rounded pieces. Internally it is dull, rarely ſomewhat glimmering. Its fracture in the great is imperfectly ſlaty, and in the ſmall intermediate between ſplintery and uneven, inclining ſometimes to flat conchoidal. Its fragments are ſharp-edged, indeterminate. It is opaque, occaſionally ſomewhat tranſlucent on the edges. It is hard, but not difficult to break, and is moderately heavy. Before the blow-pipe it becomes white and friable. It is found among tranſition mountains, in thick beds, in Bohemia, Saxony, Switzerland, the ſouth of Scotland, and Siberia, &c. Wiedenmann ſuppoſes that this ſubſtance is argillite, containing a larger proportion than uſual of ſilex. It is one of the numerous rock maſſes called by the Germans Hornſchiefer. The ſecond ſubſpecies is the *baſanite* of Kirwan, the Lydian ſtone, or touch-ſtone. Its colour is greyiſh, paſſing into blueiſh-black. It occurs in maſs and in rounded fragments, generally penetrated by veins of quartz. Internally it is glimmering. Its fracture is even, approaching to conchoidal, and ſometimes to ſplintery: in maſs it is generally ſlaty. Its fragments are indeterminate and ſharp-edged, often trapezoidal. It is opaque, moderately hard, and eaſily frangible. Sp. grav. 2.4 to 2.8. It is found in ſimilar ſituations with the preceding. It is uſed, on account of its hardneſs and colour, as a touch-ſtone to aſcertain the comparative purity of the various kinds of gold and ſilver alloys. (See Touch stone.) Humboldt aſcribes its black colour to a portion of carbon See Schistus.

KIEV, Kief, *Kiof*, or *Kiow*, in *Geography*, a government of Ruſſia, bounded on the N. and N.E. by the government of Tchernigof, on the S.E. by the government of Ekaterinoſlav, on the S.W. and N.W. by Poland; about 148 miles long and 60 broad; ſituated for the moſt part on the left ſide of the Dnieper. Being part of the Ukraine, or Little Ruſſia, it was once a duchy belonging to the great dukes, and Kief was their principal reſidence. This country was conquered by the Tartars, and came again into the poſſeſſion of the great dukes; but was afterwards over-ran and poſſeſſed by the Coſſacks, under the protection of Poland. In 1654, the natives, diſcontented with John Caſimir, king of Poland, ſubmitted to Ruſſia, and have ever ſince continued ſubject to that empire. The vaſt privileges enjoyed by the natives have been gradually aboliſhed, and they are now reduced to the ſame ſtate as the other provinces of the Ruſſian empire. The country is a continued plain, very fertile, and producing abundance of grain and paſture, honey, flax, tobacco, &c. Its capital is Kiev or Kiof.

Kiev, *Kief*, or *Kiof*, the capital of the above government, and of the diſtrict belonging to it, is ſituated on the *Dnieper*, which ſee. It conſiſts of three ſmall towns, *viz.* the caſtle of Petſherſky, with its ſuburbs; the old city of Kiev; and the town of Podol, which lies below the latter. All theſe are partly incloſed by a common fortification, and communicate by a large entrenchment, carried on as the inequality of mountains would allow. The firſt mentioned caſtle ſtands on an eminence facing the ſouth; and, beſides barracks for the garriſon, magazines, officers' houſes, and ſome churches, includes a rich and ſtately monaſtery, founded in the eleventh century, and called "Petſherſky," becauſe the monks formerly lived in a "petſhera," like a cavern, on the mountain where the convent now ſtands. In its ſubterraneous vaults, which reſemble a labyrinth, and conſiſt of cells, chapels, &c. are found great numbers of undecayed bodies, ſuppoſed to be the remains of ſaints and martyrs. The old city of Kiev ſtands on an eminence facing the north, and is fortified, according to the mountainous nature of the country, with horn-works, &c. Here ſtands the cathedral. Podol lies below old Kiev, in the plain on the banks of the Dnieper, and beſides the univerſity, churches, and convents, entirely conſiſts of ſhops and tradeſmen's houſes. This city is the ſee of a Greek archbiſhop; 420 miles E. of Cracow. N. lat. 50° 32′. E. long. 30° 56′.

KIEUSK, a town of Natolia; 40 miles N.N.W. of Mogla.

KIEZVENSKOE, a town of Ruſſia, in the government of Perm; 80 miles N. of Perm.

KIFANTAN, a town of Bootan; 64 miles N. of Dinagepour.

KIFFER, an iſland in the Eaſt Indian ſea, about 20 miles in circumference, near the north coaſt of the iſland of Timor. S. lat. 8° 0′. E. long. 126° 20′.

KIFTELAK, a town of Hungary; 18 miles N.W. of Zegedin.

KIGELGA, one of the *Fox-iſlands*, which ſee. N. lat. 54°. E. long. 194° 28′.

KIGGELARIA, in *Botany*, was named by Linnæus in honour of Francis Kiggelar, a Dutchman, who imported many new and rare plants into Europe from America, and who publiſhed the *Hortus Beaumontianus* in 1690, and obſervations on *Commelin's Hortus Amſtelodamenſis* in 1697.—Linn. Gen. 528. Schreb. 697. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 409. Juſſ. 387. Lamarck. Dict. v. 3. 365. Illuſtr. t. 821. Gærtn. t. 44.—Claſs and order, *Dioecia Decandria*. Nat. Ord. *Columniferæ*, Linn. *Euphorbiæ*, Juſſ.

Gen. Ch. Male, *Cal.* Perianth of one leaf, concave, divided into five lanceolate, concave ſegments. *Cor.* Petals five, lanceolate, concave, a little longer than the calyx, and forming with it a ſort of cup; nectary of five ſmall, obtuſely three-lobed, depreſſed, coloured glands, the middle lobe larger; each gland attached to the claw of a petal. *Stam.* Filaments ten, very ſmall; anthers oblong, ſhorter than the calyx, opening at the tips by two perforations.—Female, *Cal.* and *Cor.* as in the male. *Piſt.* Germen ſuperior, roundiſh; ſtyles five, ſimple; ſtigmas obtuſe, ſlightly cloven. *Peric.* Capſule leathery, globoſe, rough, of one cell, and five valves. *Seeds* numerous, about eight, roundiſh, afterwards angulated, each covered with a tunic.

Eſſ. Ch. Male, Calyx five-cleft. Corolla of five petals; glands five, three-lobed. Anthers perforated at the tips. Female, Calyx and Corolla like the male. Styles five. Capſule of one cell, five valves, and many ſeeds.

1. *K. africana.* Linn. Sp. Pl. 1466. Hort. Cliff. 462. t. 29.—A native of the Cape of Good Hope It flowers in May and June, and was cultivated, ſo early as 1690, in the Royal Garden at Hampton Court. This *tree* generally riſes to the height of ſix or ſeven feet. *Stems* ſtrong and woody. The *bark* of the *branches* is at firſt ſmooth and green, but afterwards purpliſh. *Leaves* on footſtalks, alternate, lanceolate, ſerrated, ſpreading. On the male plant, *panicles of flowers* appear on branched ſtalks, with white petals and yellow nectaries; on the female, each flower ſtands on a ſimple ſtalk. *Capſule* rugged, and pubeſcent on the outſide, containing a reddiſh or ruſty-coloured pulp, in which the *ſeeds* are imbedded. The *fruit* has attained its full ſize in Chelſea Garden, but the *ſeeds* rarely come to maturity in this country.

Kiggelaria, in *Gardening*, compriſes a plant of the ever-green ſhrubby kind, which is the African kiggelaria, (K. Africana.)

Method of Culture.—Plants of this ſort may be increaſed by ſeeds, layers, and cuttings; but the ſeed method is the beſt, as they root but ſparingly in the other two modes.

The ſeeds ſhould be ſown in the early autumn, in pots filled with freſh loamy earth, being plunged in a hot-bed. After they have a few inches growth, they ſhould be removed into ſeparate ſmall pots, re-plunging them in the hot-bed; and when well rooted, they ought to be gradually hardened to the effects of the open air. The layers ſhould be made from the young ſhoots of the ſame year, putting them down in the ſummer months.

The cuttings of the young ſhoots ſhould be planted in the ſpring, immediately before the plants begin to ſhoot, in pots filled with ſoft loamy earth, being plunged in a very moderate hot-bed, and covered with glaſſes to exclude the air; due ſhade being afforded, and but little water given after the firſt planting. Such plants as ſtrike root may be removed into ſeparate ſmall pots of loamy earth, and be expoſed to the air, in a warm ſheltered ſituation, until the autumn, when they ſhould be placed under the protection of the green-houſe, and managed in the ſame mode as orange trees.

Theſe plants afford variety among other plants of the green-houſe kind, that are in pots.

KIGLEY, or Kighley, in *Geography*. See Keighley.

KIJASA, a mountain of Thibet; 25 miles S.E. of Giti.

KIKACCO, a town of Africa, in the kingdom of Congo; 30 miles S.E. of Pango.

KIKALA, a town of Sweden, in South Finland; 40 miles E.S.E. of Abo.

KIKIANY, one of the ſmall Japaneſe iſlands. N. lat. 29° 40′. E. long. 132° 25′.

KIKOV, a town of Japan, in the iſland of Niphon; 15 miles S.E. of Iwata.

KIKUKOVI, a town of Ruſſia, in the government of Tobolſk, on the Tchulim; 64 miles N.W. of Atchinſk.

KIKUTZ, a town of Japan, in the iſland of Ximo; 15 miles N.N.E. of Udo.

KIL, a town of Sweden, in the province of Warmeland; 12 miles S. of Chriſtinehamn.

KILAN, a province of the ſouth-eaſtern part of Great Bucharia, deriving its name, like the other provinces of this country, from its chief city.

KILANG. See Kelang.

KILANOI, a town of Sweden, in Weſt Bothnia; 105 miles N. of Tornea.

KILAR, a town of Perſia, in the province of Irak; 14 miles S.E. of Taheran.

KILBARCHAN, a ſmall town of Renfrewſhire, about 4 miles N.W. from Paiſley, and nearly the ſame diſtance from Renfrew. Kilbarchan is a thriving place, chiefly inhabited by the tradeſpeople employed in the various proceſſes of the extenſive cotton manufactures carried on through the whole of this diſtrict. There are alſo conſiderable manufactories of Scotch thread eſtabliſhed here.

KILBEGGAN, a poſt-town of the county of Weſtmeath, Ireland, which, before the union, had the privilege of ſending members to the houſe of commons. It is a ſmall town, on the river Broſna, and is remarkable for two old monaſteries. It is on the road from Dublin to Galway; 44 miles W. from Dublin, and 15 E. from Athlone.

KILBIRNIE, a village of Renfrewſhire, near Beith, where there is a fine loch or lake of water. It is a populous, thriving, little place, engaged, like moſt others in that part of the country, in the manufactures of cotton goods and thread.

KILBRIDE, East, is a ſmall village in Lanarkſhire, about 10 miles S.E. from Glaſgow. It is remarkable for ſome Roman antiquities, which have engaged the attention of antiquarians, who have publiſhed detailed accounts of various curioſities found and dug up in this neighbourhood. At preſent the great quantities of fine lime, which are worked in its neighbourhood, engage a conſiderably greater portion of attention, as it is found of great advantage to the whole ſurrounding diſtrict, both for the purpoſes of agriculture and building.

Kilbride, *Weſt*, is a ſmall village contiguous to the firth of Clyde, in Ayrſhire.

KILBURG, a town of France, in the department of the Sarre, and chief place of a canton, in the diſtrict of Prum. The place contains 561, and the canton 4307 inhabitants, in 26 communes.

KILCH, in *Ichthyology*, a name uſed by ſome for a ſpecies of fiſh of the albula kind, caught in the lakes of Germany, of a fine firm fleſh and delicate flavour, and ſeems very little, if at all, different from the ferra.

KILCOCK, in *Geography*, a poſt-town of the county of Kildare, province of Leinſter, Ireland, ſituated upon the river Blackwater. It is a ſmall town, 14 miles W. by N. from Dublin, on the road to Mullingar.

KILCONNELL, a ſmall poſt-town or village of the county of Galway, Ireland; 78 miles W. from Dublin, and almoſt 25 E. from Galway.

KILCULLEN, or Kilcullen-bridge, a poſt-town of the county of Kildare, province of Leinſter, Ireland, ſituated on the river Liffey, over which it has a bridge. It is on the great ſouthern road from Dublin, in conſequence of which its inns are much frequented. One mile and half ſouth of it is the village of Old Kilcullen, where is a church, and reſident clergyman. Here is a round tower, not exceeding 50 feet in height; and the ſhaft of a croſs, of a ſingle ſtone, 10 feet high. Kilcullen-bridge is 21 miles S.W. from Dublin. Carliſle.

KILDA, St., or Hirta, a remote iſland among the Hebrides, or weſtern iſlands of Scotland. It is ſeated in the Northern ocean, at the diſtance of about 60 miles from Harris, and 160 miles from the neareſt point of the main land of Scotland. This iſland is ſmall, being only three miles in diameter from eaſt to weſt, and two miles in a tranſverſe direction: the whole circumference is about ten miles. It is nearly ſurrounded with a perpendicular face of rock, which riſes to a conſiderable elevation; a ſmall bay or landing-place is found to the ſouth-eaſt. Mr. Macaulay, the hiſtorian of this iſland, ſays, it "may be ranked among the greateſt curioſities of the Britiſh empire. The ſituation of the place, the genius of the inhabitants, their manners and cuſtoms, the conſtitution of their little commonwealth, that amazing dexterity with which they manage the moſt important branches of their buſineſs, that unexampled courage with which they encounter dangers inſurmountable to any other race of men, and that perhaps happy ignorance which renders them abſolute ſtrangers to thoſe extravagant deſires and endleſs purſuits which keep the great and active world in a conſtant agitation;—all theſe, and ſome other extraordinary circumſtances, taken together at one view, ſeem highly to merit the attention of the inquiſitive." The ſurface of the iſland is moſtly rocky: in ſome places are patches of moſs, and in others graſs. The ſoil, though in many places well adapted to corn, is chiefly employed in paſture; as the inhabitants are rather averſe to agricultural purſuits. In the vicinity of the village a little corn is cultivated, and the paſture is richly manured. Barley and oats are only ſown: potatoes and cabbages, and ſome other garden plants, have recently been introduced into the iſland. Several ſprings iſſue from the hills, and form two ſmall ſtreams which run into the ſea on the eaſt and on the weſt. The village conſiſts of two rows of houſes, which are ſituated about a quarter of a mile from the bay, and contains all the inhabitants of Kilda. In the year 1764, when Macaulay publiſhed his Hiſtory, the iſland contained only 88 perſons; but he aſſerts that a contagious diſtemper (the ſmall-pox) "ſwept away the greateſt part of the people about four-and-thirty years ago." Martin found 180 perſons, when he viſited the iſland at the time here alluded to, *i. e.* 1690. The dwellings are all low, common huts, or cottages; divided into two rooms each, and peculiarly flat in the roof. One of the apartments is appropriated to the dwelling and ſleeping of the inhabitants, and the other for the cattle during winter. In theſe rooms they prepare the chief manure for the lands. Beſides theſe cottages, there are ſeveral cells or ſtorehouſes in different parts of the iſland. Theſe are compoſed wholly of ſtones, and are from 12 to 18 feet in length, by 7 feet in breadth and height. Fowl, eggs, and ſheep are the principal objects of care and ſolicitude to the Kildeans, who entirely ſupport themſelves, and pay their rents with theſe. The inhabitants manifeſt particular ſkill and courage in obtaining the firſt: for as their places of reſort for rearing their young, for rooſting, &c. are receſſes in the lofty cliffs on the coaſt, it requires particular adroitneſs and courage to reach ſuch ſpots. A fowling party conſiſts of four men, who are provided with a ſtrong rope made from thongs of raw cow-hide. One end of this is faſtened on the top of the cliff, whilſt two men deſcend by means of the rope to various cliffs in the rock, where they ſearch for eggs and young birds. Among theſe, the ſoland gooſe or gannet is deemed the moſt valuable prize.

The laird of Macleod is proprietor of this iſland, and its dependants, rocks, &c. He ſends his ſteward annually to collect the rents, which are paid in ſheep, butter, cheeſe, and wild-fowl. Around the iſland are ſeveral ſmall inſulated rocks, which are often covered with wild-fowl. Fluors, ſpars, and rock cryſtals are found on the north ſide of the iſland. This inſulated ſpot was certainly viſited by religious perſons at a remote period. Macaulay deſcribes a circular arrangement of upright ſtones, which he calls a Druidical temple; with other remnants of pagan worſhip and monaſtic rites. See his Hiſtory of St. Kilda, 8vo. 1764.

KILDARE, a county in the province of Leinſter, Ireland, bounded on the north by Meath, on the eaſt by Dublin and Wicklow, on the ſouth by Carlow, and on the weſt by the King's county and Queen's county. It extends from north to ſouth 32 Iriſh (40½ Engliſh) miles, and from eaſt to weſt 21 Iriſh (26½ Engliſh) miles, forming an area of 242,245 plantation acres, or 369 ſquare miles, equal to 389,198 Engliſh or ſtatute acres. Of theſe, there are 41,035 acres of bog. The number of pariſhes is ſtated by Dr. Beaufort to be 113; of which, 57 pariſhes belong to the ſee of Dublin, and 56 to that of Kildare. From unions there are, however, only 39 benefices, and 23 churches. The number of houſes ſtated in the return uſed by Dr. Beaufort is 11,205, from which the inhabitants are eſtimated at 56,000. This is a thin population for a county ſo near the capital, and not at all encumbered with mountains or high hills: but beſides the great proportion of bog it contains, upwards of 3000 acres are occupied by the *Curragh;* and although this beautiful plain affords paſture to an immenſe number of ſheep, there are but a very few habitations ſcattered around its edges. This county is moſtly flat, of fine arable ſoil, but much exhauſted, as, from its vicinity to Dublin, it has been for centuries the county from which the capital has principally drawn its ſupplies of grain. "In a county where one-fifth is bog," ſays Mr. Rawſon in his Survey, "much water muſt lie on the ſurface: this, of courſe, attracts the rain from every paſſing cloud. It may be remarked in the ſummer ſeaſon, that where a cloud paſſes over an extenſive bog or river, it is arreſted and drawn down. This cauſes the county to be ſubject to more moiſture than any in Ireland; and this evil muſt continue until the kingdom be relieved by a general drainage act, which ſhall compel ſlothful occupiers and proprietors to come forward, and contribute to ſuch extenſive drainings, on a great public ſcale, as the legiſlature may in its wiſdom direct, according to the benefit to be derived by each eſtate or property, through which ſuch drains ſhall be pointed out." Since the preceding remarks were written, an act of parliament has been paſſed, and ſums of money granted, for aſcertaining the nature and extent of the various large tracts of bog in Ireland; and the reports of the engineers employed contain much valuable information. For this ſtep, preparatory to a more effective meaſure, if the legiſlature ſhall be induced to proceed, the country is indebted, as for many other advantages, to the right honourable John Foſter, late chancellor of the Iriſh exchequer;—a gentleman who, though now often loaded with reproaches from a ſpirit of party, will in future times be numbered amongſt the greateſt benefactors of Ireland. The county of Kildare is full of ſprings and rivulets. The river Barrow forms its ſouth-weſt boundary, and receives the Grees. The Liffey takes a circular courſe through the north-eaſt of the county, and the river Boyne riſes in the bog of Allen. The Barrow is navigable from Athy, where it meets the Grand Canal, which, from Dublin, paſſes through this county, croſſing the Liffey on an aqueduct bridge, and ſoon after branches off. Near Claine is a collateral cut to the Shannon. The Royal Canal alſo has been carried through the northern part of the county, ſo that great advantage is derived to the inhabitants from the cheap conveyance of their products to market. The principal towns are Naas, the aſſize town, Athy, Monaſteraven, and Kildare; for account of which, ſee the articles under the reſpective names. As there is no borough of ſufficient extent to return a member to parliament, the county is repreſented by the two knights of the ſhire only; whilſt, before the union, it had ten members. Kildare was part of the territory acquired by earl Strongbow, in right of his wife, Eva, daughter of Dermot, king of Leinſter. From its neighbourhood to Dublin it was early colonized, and formed part of the Engliſh pale, when confined to four counties. There are in it the ruins of many caſtles and abbeys, ſome of which are mentioned in other parts of this work. It was alſo the ſcene of much diſtreſs during the rebellion of 1798; many battles having been fought in it, and a vaſt number of houſes deſtroyed, both by the rebels, and by the military force ſent to ſubdue them. Beaufort's Memoir. Rawſon's Statiſtical Account.

KILDARE, a poſt-town of the county of Kildare, Ireland. It is a ſmall and ruinous place, but it retains ſome veſtiges of having been of more importance in former times. There is a very fine round tower 130 feet high, and the ruins of two abbeys and of its cathedral. Except when there are races or encampments on the Curragh, which is very near it, it has no trade. It is 25 miles W.S.W. from Dublin.

KILDARE, a biſhopric in the province of Dublin, founded about the end of the 5th century. It comprehends part of three counties, *viz.* Kildare, King's county, Queen's county, and contains 332,200 plantation acres, which are divided into 81 pariſhes. The crown is patron of 27, the biſhop of 30, and different laymen of 24 pariſhes. In conſequence of unions, however, there are but 31 benefices, and 28 churches. The biſhop has no place of reſidence in his dioceſe, but being always dean of Chriſt-church, Dublin, reſides in or near that capital. Beaufort.

KILDERKIN, a kind of liquid meaſure, which contains two firkins, or eighteen gallons, beer-meaſure, and ſixteen ale-meaſure.

Two kilderkins make a barrel, and four an hogſhead.

KILDORRERY, in *Geography*, a ſmall poſt-town of the county of Cork, province of Munſter, Ireland; 107 miles S.W. from Dublin.

KILDUIN, a ſmall iſland in the North ſea. N. lat. 69°. E. long. 34° 14′.

KILDYSART, a ſmall poſt-town of the county of Clare, province of Munſter, Ireland, on the river Shannon; 122 miles S.W. from Dublin.

KILEF, a town of Great Bucharia, in the country of Balk, on the left ſide of the Gihon; 60 miles N.W. of Balk. N. lat. 37° 10′. E. long. 64° 30′.

KILFIT, a ſea-port town of Nubia, on the Red ſea, with a harbour, ſeven miles in circumference, ſafe from winds. N. lat. 21° 45′. E. long. 36° 40′.

KILGRUND, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 62° 5′. E. long. 21° 4′.

KILIA, or KILIA-NOVA, a town of European Turkey, in the province of Beſſarabia, at the mouth of the Danube, near the Black ſea; 20 miles E.N.E. of Iſmail. N. lat. 45° 28′. E. long. 30° 12′.

KILIOS, a town of Aſiatic Turkey, in Natolia, on the coaſt of the Black ſea; 20 miles W.S.W. of Amaſieh.

KILKARE, a town of Hindooſtan, in Marawar; 10 miles S.W. of Ramanadporum.

KILKEALE, a poſt-town of Ireland, in the county of Down, and province of Ulſter. It is ſituated on the Iriſh ſea, under the Mourne mountains, great part of which are in the pariſh of Kilkeale. It is 65 miles N. by E. from Dublin.

KILKENNY, the name of a county of Ireland, in the province of Leinſter. The ſurface of it extends from 52° 14′ to 52° 52′ N. lat. and from 6° 56′ to 7° 37′ W. long. from Greenwich. Its greateſt length from N. to S. from the Slewmagy hills to the Suire is 36 Iriſh (45½ Engliſh) miles; and its greateſt breadth from E. to W. is about 19 Iriſh (24 Engliſh) miles, but in the narroweſt part is not above 12 miles. The area, according to Dr. Beaufort, is 300,350 Iriſh, equal to 482,464 Engliſh acres; but Mr. Tighe, in his valuable ſtatiſtical ſurvey, from which this article is chiefly extracted, ſays, that by a ſurvey lately made for the uſe of the grand jury, they are ſtated at 318,249 Iriſh, which are equal to 510,882 Engliſh acres. The population, as calculated with great care from the hearth returns in 1800, is about 108,000 in 17,212 houſes. Dr. Beaufort, however, in 1792, ſtated the houſes as 17,569, though he did not make the inhabitants exceed 100,000; and he obſerves that the houſes are much fewer than what might be expected in a county which has been generally eſteemed one of the moſt populous in Ireland. The latter writer ſtates the number of pariſhes to be 127, of which 121, united in 45 benefices, are in the dioceſe of Offory, and the remaining ſix, forming four benefices, in that of Leighlin. The entire number of churches in the county is only 31, a very conſiderable proportion of the population being Roman Catholic. The poſition of a country ſtrongly affects the climate. This is agreeably experienced in this county. The declivity from the northern to the ſouthern boundary is about 500 feet, which conveys, with ſufficient rapidity, the water that falls upon the ſurface; and the river Nore flowing through the centre, deſcends about 13 feet during the run of a mile. Beſides this deſcent, which carries off the water, the ſurface of the county enjoys a favourable expoſure to the ſouth-eaſt. There is little either of bog or marſh to contain ſtagnant water, and the greater part of the ſubſtratum is limeſtone, brittle ſchiſtus, or porous argillite, and only in a ſmall part, a retentive clay. The vicinity of the ocean tends to render the climate mild, while the clouds, which are driven forward by the weſtern and ſouth-weſtern winds, are not arreſted here by high mountains, but paſſing over the low ſecondary hills and extended plains of this county, are attracted towards the lofty and primary ranges of rocks which riſe on the north-eaſt. From theſe circumſtances the crops are earlier in general than in the tillage countries to the northward. The quality of the ſoil is in general excellent. The northern part rather bears the appearance of poverty, but by judicious management, and the prudent application of lime and limeſtone gravel, it may be rendered conſiderably productive in corn and graſs. The ſouthern part is more favoured by nature; and where the hills ſubſide into plains or vallies, fertility ſmiles in all its native excellence. The Nore exhibits upon its banks the moſt delightful proſpects and the moſt luxuriant fields. It is not difficult to trace the nature of the different minerals in this county. Here is a termination of a chain of granite hills which take their riſe in Wicklow. The ſtone which uſually joins the granite, appearing to be impoſed on it, is ſiliceous ſchiſtus, and lower down occurs argillaceous ſlate; on the ſurface of the lower grounds are found large boulders of quartz, ſometimes pure white, ſometimes ſtreaked with red, and ſometimes encloſing yellow mica. In this granite diſtrict are alſo found a few beds of marle and limeſtone gravel near the foot of Brandon hill. Many of the lower hills conſiſt of ſiliceous breccia, which is compoſed of a ſilicious cement enveloping rounded pebbles of quartz, which have often a reddiſh tinge, and are from the ſize of a pea to two or three inches diameter. Such a breccia alſo forms many hills in the S. of Ireland, as the Galtees and other mountains in Cork and Limerick, and at leaſt part of Magillicuddy's rocks in Kerry. This breccia, when of a fine grain, is worked for millſtones. In the northern part of the county are excellent quarries for flags, eſpecially that of Shankill. The flags raiſed here are ſent to Dublin, Cork, and other places, where they chiefly go under the denomination of Carlow flags, being raiſed in the neighbourhood of that county, and moſtly ſent through the town of Carlow. The collieries of Caſtlecomer have been worked for about a century, and are yet unexhauſted. The coal found in them, and in other parts of the S. of Ireland, is un-inflammable, and is called Stone coal and Kilkenny coal, and when of inferior quality, *culm*. By Mr. Kirwan's analyſis it contains 97.3 *per cent.* of pure carbon. Mr. Tighe has given a very full account of the accompanying ſtrata, the manner of working, the expence, &c. The late lord Wandesford uſed to clear 6000*l.* or 7000*l.* a-year by theſe collieries, and ſometimes more. They now belong to lady Ormonde. The excellent qualities of the Kilkenny coal are well known in Ireland; on this account it is ſent to the north and the ſouth, to Londonderry, to Belfaſt, to Cork, and to Waterford, as well as to Dublin. No fuel dries malt ſo well, and this without any preparation; it is excellent for the forge, and for moſt works in iron; in every manufacture where ſteady heat is required devoid of ſmoke it cannot be excelled; nor does it dirty the flues where it is uſed. Manganeſe, iron ore, lead ore, and ſome indications of copper ore, are perceived in different parts. As long as timber laſted near Caſtlecomer, iron ore was ſmelted there; but it is now above ſeventy years ſince the forges have been uſed. In the limeſtone diſtrict of this county are many valuable marble quarries. The marble is black, though often with white marks, which appear more ſtrongly, or increaſe by long expoſure to the air. That which approaches neareſt to black is moſt valued. It contains a great variety of impreſſions, of madrepores, of bivalve, and of turbinate ſhells. By analyſis, a ſpecimen of the kind moſt uſual in chimney-pieces with marks of bivalve ſhells, contained 98 *per cent.* ſoluble in marine acid, and left 2 *per cent.* of a black powder, which appeared to be carbon, and burned without leaving any aſhes. On the whole, Kilkenny marble may be conſidered as containing 97 *per cent.* pure carbonate of lime, two *per cent.* carbon, and 1 *per cent.* magneſia and iron, of which the former is in the largeſt proportion. This marble is a valuable article of commerce. The quantity exported, notwithſtanding the diſadvantage of land carriage, is about 50 tons annually; if a canal were made it would conſiderably increaſe the demand, by lowering the price. There is a mill near Kilkenny, by which the marble is ſawed and poliſhed, which makes the price of chimney-pieces on the ſpot very reaſonable. There is a chalybeate ſpa at Ballyſpellin, near Johnſtown, the medical effects of which have been often celebrated, and which is much frequented. The rivers of this county excel both in utility and beauty. The following poetical account of them by the immortal Spenſer preſents an accurate, conciſe, and clear account of the origin, termination, and qualities of the three principal ones.

“ And there the three renowned brethren were,
Which that great giant Blomius begot
Of the fair nymph Rheüſa wand'ring there,
One day as ſhe to ſhun the ſeaſon hot,
Under Slewbloome in ſhady grove was got,
This giant found her, and by force deflowered;
Whereof conceiving ſhe in time forth brought
Theſe three fair ſons, which being thenceforth poured
In three great rivers ran, and many countries ſcoured.

The firſt the gentle Shure, that making way
By ſweet Clonmell, adorns rich Waterford;
The next the ſtubborn Newre, whoſe waters grey
By fair Kilkenny and Roſſe-ponte board;
The third, the goodly Barrow, which doth hoard
Great heaps of ſalmon in his deep boſom:
All which long ſundred, do at laſt accord
To join in one, ere to the ſea they come,
So flowing all from one, all one at laſt become.”

The Suir, which divides Kilkenny from Waterford, in a winding and majeſtic courſe of about 16 miles, conveys along the ſouthern border of this county, the trade that paſſes between Waterford, Carrick, and Clonmell. The Barrow ſkirts the eaſtern borders for about 20 miles, dividing it from Wexford and part of Carlow. This river is navigable to the town of Carlow, and thence communicates with the grand canal. The Newre, or Nore, more peculiarly belongs to this county, flowing nearly through its central part, in a winding courſe of not leſs than 36 miles from the neighbourhood of Durrow to its junction with the Barrow, paſſing by the city of Kilkenny. This laſt river receives many tributary ſtreams, and is navigable for ſmall veſſels to Iniſtioge. It is unneceſſary to enter into a minute detail of the obvious advantages of theſe rivers, both to the external appearance of the country and to the accommodation of the inhabitants. The natural and local advantages of this county tend to promote the intereſts of agriculture, which flouriſh in great perfection in different places, and the eaſy conveyance by water affords a ready market for all the productions of the ſoil. The roads in general are in good repair, and their ſituation judiciouſly choſen.

The county town is Kilkenny; beſides, Callan, Iniſtioge, Thomaſtown, Gowran, Knocktopher, Graigne Durrow, Caſtlecomer, and Freſhford, are entitled to the name of towns, though all of them are ſmall ones. There are five round towers in this county, namely, at St. Canice, Tulloherin, Kilree, Fartagh, and Aghaviller. The laſt is the moſt ruinous. Theſe are all ſituated cloſe to the churches, and whatever may have been their origin, appear admirably fitted for belfries. Gramig, or Grandiſon caſtle, is one of the moſt conſiderable remains of antiquity; it is ſituated on the banks of the river Suir. The whole county is full of caſtles, having been one of the firſt in which the Engliſh ſettled. It became part of the property of earl Strongbow, from whom it deſcended to the Mareſchals, earls of Pembroke. Iſabella, one of the daughters and coheireſſes of William, the laſt earl, conveyed it to Gilbert Clare, earl of Glouceſter and Hereford. The greater part of it afterwards came into poſſeſſion of the Butlers, earls and dukes of Ormond. The houſes of ſome of the abſentees bear evident marks of decay; theſe, however, are outweighed by the modern ſtructures, many of which are ornamented by the taſte of the proprietors. Tighe's Kilkenny; Beaufort's Memoirs; Robertſon's Traveller's Guide.

KILKENNY, a city of Ireland, in the county of the ſame name, and province of Leinſter, which, with the borough of St. Canice, forms one large town, ſurrounded by a diſtrict, called the county of the city of Kilkenny; it is delightfully ſituated on the river Nore, over which are two handſome bridges; it contains 2870 houſes, and a population of nearly 16,000. There are many large and good buildings, among which, the moſt remarkable are the biſhop's palace, the magnificent caſtle of the earl of Ormond, and the celebrated free ſchool or college, where many learned men, among whom Swift, Berkeley, and Congreve are conſpicuous, were educated. The inhabitants of Kilkenny have been long noted for the politeneſs of their manners. In this city and its environs abundance of blankets and much coarſe woollen cloth are manufactured. Kilkenny was formerly repreſented by four members, two for the city, and two for the borough of St. Canice. At preſent it has only one repreſentative. In former times parliaments were often held here, and the famous conſtitutions of Kilkenny, made when Lionel, duke of Clarence, was chief governor, in the reign of Edward III., long continued to be regarded as of the utmoſt importance to the welfare of the Engliſh colony. Kilkenny was alſo the ſeat of the Catholic council during the civil war, that ſucceeded the inſurrection of 1641. There are but two churches in the city, but there are ſeveral Roman Catholic chapels, each of which has congregations more numerous than both the churches. Kilkenny is 57½ miles S.W. from Dublin. N. lat. 52° 38′. W. long. 7° 15′. Beaufort. Tighe.

KILKENNY, a town of America, in Grafton county, New Hampſhire, incorporated in 1774, and containing 18 inhabitants.

KILKENNY *Coal.* See COAL, and KILKENNY, *ſupra.*

KILKENNY *Marble*, a fine black marble full of ſhells, and coralloid bodies, and much uſed in chimney-pieces, &c. See *Coralloid* MARBLE, and KILKENNY.

KILKERRAN BAY, in *Geography*, a harbour of Ireland, in the county of Galway, in that part of it called Connamara; in it there is good anchorage for veſſels of any burden, but the wild ſtate of the country prevents its being of much uſe. Its entrance is in N. lat. 53° 15′. W. long. 9° 50′. Beaufort. M'Kenzie.

KILKILA, a town of Perſian Armenia; 26 miles N.W. of Kanja.

KILL, an Iriſh word ſignifying a church or cemetery, which is uſed as a prefix to the names of many places in Ireland. There are two or three villages of this name, one on the great ſouthern road, about 12 miles from Dublin.

KILLACK, in *Geography*, a town of Perſia, in the province of Mekran, on the coaſt of the Arabian ſea; 60 miles W. of Tiz. N. lat. 25° 27′. E. long. 59° 20′.

KILLALI, a town of Abyſſinia; 100 miles S. of Mine.

KILLALLA, a ſea-port and poſt-town of the county of Mayo, province of Connaught, Ireland. It is ſituated on the weſtern coaſt of a bay of that name, opening into the Atlantic ocean, and is the ſee of a biſhop. There are ſome coarſe linen and woollen cloths made in it, but fiſhing is the chief occupation of the inhabitants. The French landed at this place on the 22d of Auguſt, 1798, and took poſſeſſion of it. A very intereſting narrative of their proceedings, till their departure, was publiſhed by Dr. Stock, at that time biſhop, who was a priſoner. Killalla is 127 miles N.W. from Dublin, and 24 nearly N. from Caſtlebar.

Killalla, a biſhopric in Ireland, founded in the fifth century, which is united with Achonry, and is in the eccleſiaſtical province of Tuam. The united ſees extend into the counties of Mayo and Sligo, the river May and the Ox mountains forming the boundary between them. They meaſure E. and W. 55 miles, and from N. to S. 21 miles. Large as this diſtrict is, there are only 20 benefices, each of which has a church, though only eight have glebe houſes. The cathedral is ſmall, but venerable for its antiquity; it is the only church in the pariſh, though a round tower at the other end of the town indicates the ancient ſcite of another church, of which no veſtige now remains. Beaufort.

KILLALOE, a biſhopric in Ireland, in the eccleſiaſtical province of Caſhel. It was founded early in the fifth century, and in 1752 was united with Killfenora, which, though ſmall in extent and value, had continued ſeparate till after the revolution, and was then annexed for ſeveral years to the ſees of Tuam and Clonfert ſucceſſively. The united ſees comprehend moſt of the county of Clare, and part of Tipperary, with ſmall portions of the King's and Queen's counties, Galway, and Limerick. The 138 pariſhes, united and condenſed into 50 benefices, have only 38 churches and four glebe houſes. The church of Killaloe is not large for a cathedral, but venerable for its antiquity, and in good preſervation, though built above 660 years. Beaufort.

Killaloe, a ſmall poſt-town of Ireland, in the county of Clare, and province of Munſter, Ireland. It is ſituated on the Shannon, over which it has a bridge of 19 arches. Below the bridge is a ledge of rocks which prevents the navigation of the river: here is a conſiderable ſalmon and eel fiſhery; but there is nothing beautiful in the town except the ſituation: very near the town, in the midſt of a fine demeſne, on the weſtern bank of the Shannon, the biſhop has a handſome reſidence, lately erected. Killaloe is 86½ miles S.W. by W. from Dublin, and 25 miles from Ennis.

KILLANORE, a town of Hindooſtan, in the Carnatic; 9 miles N.W. of Tritchinopoly.

KILLANY Bay, a bay on the E. coaſt of the iſland of Arranmore. N. lat. 53° 5'. W. long. 9° 36'.

KILLARD Point, a cape of Ireland, in the county of Down, at the S. of the entrance to Strangford Lough, and ſix miles E. from Downpatrick. N. lat. 54° 22'. W. long. 5° 27'.

KILLARNEY, a market and poſt-town of Ireland, in the county of Kerry, and province of Munſter. It is a neat and populous town, much frequented by ſtrangers on account of the adjoining lake, the pictureſque beauties of which charm every beholder. Lough Lane, or as it is more frequently called, the lake of Killarney, conſiſts of two lakes, joined by a long narrow channel; in the lower and larger lake, the pleaſing and the ſublime are moſt happily combined; the upper lake reflects a more ſolemn grandeur from the ſtupendous crags, with which it is encircled: but the proſpects in both are infinitely diverſified. The ſeveral iſlands, the white rocks of Mucruſs, the groves of arbutus, the venerable woods, the variety of waterfalls, and the impending cliffs, are ſeparately as delightful and intereſting as their aſſemblage is infinitely grand and magnificent. Mr. Weld has publiſhed an intereſting 4to. volume deſcriptive of the various objects that deſerve the notice of the traveller, but as theſe cannot well be abridged, we muſt paſs them over in this work. In the peninſula of Mucruſs, cobalt and other minerals have been found, but they are not worked. In Roſs iſland, in the lower lake, is a valuable mine, containing copper and lead; of the former there is not only rich ſulphuret, particularly the kind called *purple* ore, but alſo grey ore, which brings a high price. Killarney is the reſidence of the Roman Catholic biſhop of Kerry, and the population is chiefly of that religion. It is 144 miles S.W. from Dublin, and 38 W. from Cork. Beaufort.

KILLAS, in *Natural Hiſtory*, a name given by the people, who dig in the mines of Cornwall, to a kind of greyiſh-white earth, which is of great hardneſs, and ſeems to approach very much to the nature of the *ludus Helmontii* of ſome kinds, only that it is ſomewhat leſs hard than that, and has nothing of the ſepta or partitions that make the character of that foſſil. This earth contains ſo great a quantity of ſpar, that it ferments with acids very ſtrongly, though that ſpar being once diſſolved, and the earthy part of the ſubſtance only left, it will no longer ferment with theſe menſtruums; whence it is evident, that its terreſtrial matter is not alkaline, though the ſpar it contains is ſo.

This is the certain character of what is called killas in many parts of Cornwall, where it lies in ſtrata of two, three, or more feet thick, and often beſide this is laid on each ſide of the vein of tin or other ore. Its texture is either lamellar or coarſely granular; the lamellar is ſofter and leſs martial than the roof ſchiſtus: its ſpecific gravity from 2.63. to 2.666. Kirwan found 100 grains of the lamellar ſort to contain about 60 of ſilex, 25 of argil, 9 of magneſia, and 6 of iron; the greeniſh ſort contains more iron, and gives a greeniſh colour to the nitrous acid. In ſome other parts of England, the miners uſe the ſame word to expreſs a kind of white, brittle, and ſhattery ſtone, ſomewhat like the flag-ſtone with which they cover houſes in Northamptonſhire, and many other counties.

Killas is alſo uſed as the name of a ſlaty ſtone of various colours, ſpangled all over with talc in ſmall flakes in the place where they uſe it. In this ſenſe they generally expreſs themſelves, when talking of the earth deſcribed above, by the phraſe *white* killas. They alſo ſometimes call this flaky ſtone by the name *delvin*.

KILLEAM, in *Geography*, a parochial village in Stirlingſhire, ſituated on the water of Enrick, near its junction with Loch Lomond. Killeam is the birth-place of the celebrated hiſtorian and poet George Buchanan, whoſe hiſtory of Scotland, and Latin paraphraſe of the Pſalms of David, are ſo univerſally known. A handſome pillar near Killeam was lately erected as a monument to his memory. An extenſive printfield is the only manufacturing eſtabliſhment in this neighbourhood. The pure ſoft water of the Enrick is indeed extremely well fitted for all the operations of bleaching, dyeing, and printing, but the want of coal is an almoſt inſuperable objection in point of economy to ſuch works. The neareſt are nearly twelve miles diſtant. In the neighbourhood is Buchanan houſe, the family manſion of the duke of Montroſe.

KILLENAULE, a poſt-town of Ireland, in the county of Tipperary, and province of Munſter. The country around it is very fine. In the neighbourhood coal is found, of the ſame kind as that in the county of Kilkenny. It is 72½ miles S.W. from Dublin.

KILLERIES' Harbour, a bay of the Atlantic, on the weſt coaſt of Ireland, between the counties of Mayo and Galway. A vaſt number of herring buſſes rendezvous here in the fiſhing ſeaſon, from all parts of Galway and Mayo. N. lat. 53° 38′. W. long. 9° 46′.

KILLESANDRA, or Killeshandra, a poſt-town of Ireland, in the county of Cavan, and province of Ulſter. It is 61 miles N.W. from Dublin, and 8 miles S.W. from Cavan.

KILLFENORA, a village of the county of Clare, Ireland, which is the ſeat of a biſhopric, united to Killalloe. It is four miles N.N.E. from Enniſtymond, which is its poſt-town.

KILLICRANKY, a village of Perthſhire, in Scotland, near which is a famous road, cut in the ſide of a mountain, called "Killicranky Paſs:" on one ſide is a lofty mountain, and on the other a precipice of 100 yards; 12 miles N. of Dunkeld.

KILLIGRAY, a ſmall iſland of Scotland, between Lewis and North Uiſt. N. lat. 57° 43′. W. long. 7° 3′.

KILLINCHY, a poſt-town of Ireland, ſituated on Strangford Lough, in the county of Down. It is 92 miles N. by E. from Dublin.

KILLINESS Point, a cape of Scotland, on the coaſt of the county of Wigton, in Luce bay; 3 miles N. from the Mull of Galloway.

KILLING. See Homicide and Murder.

KILLINGIA, in *Botany*. See Kyllingia.

KILLINGLY, in *Geography*, a town of America, in Windham county, Connecticut, ſituated in the north-eaſtern part of the ſtate, bordering on Rhode iſland, and ſeparated from Pomfret by Quinebaug river; about 18 miles E. of Windham: incorporated in 1708, and containing 2279 inhabitants.

KILLINGTON, now Sherburne, a mountainous townſhip of America, in Rutland county, Vermont, having on the W. Medway, N.E. Barnard, S.E. Saltaſh, and containing 32 inhabitants. Killington peak is the higheſt land in Vermont, 3454 feet above the level of the ocean.

KILLINGTRINGAN Bay, a bay of Scotland, on the W. coaſt of the county of Wigton. N. lat. 54° 58′. W. long. 5° 12′.

KILLINGWORTH, a poſt-town of America, in Middleſex county, Connecticut, ſituated on Long iſland Sound; 9 miles E. of Guilford, from which it is ſeparated by a ſtream called Hammonaſſet, the Indian name of the townſhip. It was ſettled in 1663, incorporated in 1703, and contains 2049 inhabitants.

KILLISTINOES, Indians who originally inhabited a territory N. of Lake Superior, and could furniſh 250 warriors. They extend to the lake of the Hills, and N. to the Iſkimos. According to Mr. Mackenzie, they were originally the ſame people with the Algonkins, or inhabitants of the Atlantic coaſt. Their manners are deſcribed by Mackenzie. See our article Knisteneaux.

KILLMACDUAGH, a village of the county of Galway, which is an old epiſcopal ſee, united to Clonfert. It is 2½ miles from Gort, where is the pariſh church. Nothing but the walls of the cathedral remain, near which are the ruins of a monaſtery, and of ſeveral chapels. Theſe, with a large round tower, of very ancient and rude maſonry, denote the former conſequence of this wretched village. It is 12 miles N. from Ennis.

KILLMACTHOMAS, a fair and poſt-town of the county of Waterford, on the road from Cappoquin and Dungarvan to Waterford. It is 83 miles S.S.W. from Dublin.

KILLMALLOCK, a poſt-town of Ireland, which formerly ſent members to parliament. Two centuries ago, it was one of the beſt built inland towns in Ireland; the walls of many large houſes of ſtone, and excellent workmanſhip, remain to this day, whilſt the ruins of the churches and monaſteries, walls and gates, denote its former ſplendour, and have procured for it the name of the Balbec of Ireland. It is often mentioned in the military hiſtory of Ireland, and there is an extenſive diſtrict round it called the "Liberty of Killmallock." It is now, however, little more than a village; 4 miles from Charleville, 16 S. from Limerick, and 107½ S.W. from Dublin. Beaufort, &c.

KILLMICHAEL Point, a cape of Ireland, on the W. coaſt of the county of Wexford, in the Iriſh ſea. N. lat. 52° 44′. W. long. 6° 9′.

KILLMORE, a village which gives name to a biſhopric in Ireland, in the province of Armagh. The biſhopric was founded in the 13th century, and in the 15th, changed its ancient name of Brefny, into Killmore. There is no cathedral, but a ſmall pariſh church, 3½ miles from Cavan. It is ſituated in four counties, but chiefly in Cavan and Leitrim. There are 39 pariſhes in 30 benefices, and 36 churches.

KILLOS, a name given by the miners of Cornwall to a ſtone of the ſlate kind, found in the mines there. See Growan.

KILLOUGH, in *Geography*, a village of the county of Down, Ireland, on a bay to which it gives name, on the Iriſh ſea. Here is a remarkable well, called St. Scordin's well, which is highly eſteemed for the extraordinary brightneſs of its water. It is 7 miles S.E. from Clough.

KILLOW, or Cullow, an Engliſh name for a black earth of a very remarkable ſtructure, ſeeming of a mixed nature between the marbles, ochres, and clay; and uſually containing a large quantity of the matter of the common vitriolic pyrites or ink-ſtone, which gives it a very ſharp unpleaſant taſte, and makes it, when thrown on the fire, emit a ſlight blue flame of a ſulphureous ſmell, and calcine to a deep red. It is common in many parts of England, Wales, and Ireland. It is lighter than any of the other clays, though that is the genus to which it moſt properly belongs; and it is of an uneven ſurface, and ſhattery ſtructure.

KILLREA, in *Geography*, a poſt-town of Ireland, in the county of Londonderry; it is ſituated near the river Bann, and is 102 miles N. from Dublin.

KILLRUSH, a poſt-town of Ireland, in the county of Clare, and province of Munſter. It is ſituated upon the river Shannon, and is a place of ſome trade, ſome of the merchants of Limerick having agents reſiding here. It is 142 miles S.W. from Dublin.

KILLUCAN, a poſt-town of Ireland, in the county of Weſtmeath, and province of Leinſter; it is 28 miles W. by N. from Dublin.

KILLWORTH, a poſt-town of Ireland, in the county of Cork, Munſter, ſituated on the river Funcheon. It has gone very much to decay, on account of the neighbourhood of Fermoy; it is 108 miles S.W. from Dublin, and 18 N.E. from Cork.

KILLYBEGS, a poſt-town of Ireland, in the county of Donegal, which, before the Union, was repreſented in parliament. It is ſituated on a creek, on the N. ſide of Donegal bay, and has an extenſive herring-fiſhery; it is 124 miles N.W. from Dublin, and 13 miles W. from Donegal.

KILLY-HOLM, one of the ſmaller Orkney iſlands; about half a mile N. of Egliſha.

KILLYLEAGH, a poſt-town of Ireland, in the county of of Down, and province of Ulſter. It is ſituated on the W. coaſt of Strangford lough, and has a ſafe harbour for ſmall veſſels. Here ſir Hans Sloane, the famous naturaliſt, was born, in 1660; it is 80 miles N. by E. from Dublin, and 15 S.S.E. from Belfaſt.

KILLYTH-STALLION, in our *Old Writers*, is where lords of manors were bound by cuſtom to provide a ſtallion for the uſe of their tenants' mares.

KILMARNOCK, in *Geography*, a very induſtrious, thriving, manufacturing town in Ayrſhire, Scotland, 22 miles S.W. from Glaſgow. Its principal articles of ſtaple manufacture are coarſe woollens and carpets, and low priced gloves, beſides which a great number of weavers are employed in the cotton trade by the manufacturers of Glaſgow and Paiſley. Kilmarnock is ſituated in a very fertile part of the country, and is very plentifully ſupplied with coals from the extenſive coal-works of ſir William Cunningham of Caprington, which are in the immediate neighbourhood. Beſides ſir William Cunningham, the chief landed proprietors in this neighbourhood are, the ducheſs of Portland, and the counteſs of Loudon and Moira, both of whom here poſſeſs very large eſtates in their own right. The immenſe caſtle of Loudon, now building, will, when finiſhed, be one of the nobleſt family-ſeats in Britain. Kilmarnock, not being a royal borough, has no elective franchiſe for a member of parliament. In 1801, it contained 8079 inhabitants, of whom 6757 were employed in trade and manufactures. N. lat. 55° 40′. W. long. 4° 27′.

KILMES, a town of Ruſſia, in the government of Viatka; 28 miles N.E. of Malmiſch.—Alſo, a river of Ruſſia, which runs into the Viatka; 32 miles N.E. of Malmiſch.
